In regard to the theory which is founded on the idea that Jesus was actuated by selfish or worldly or ambitious motives, it may safely be affirmed that it is altogether inconsistent with the facts connected with every part of his history. The whole tenor of his proceedings showed that his views were above this world. He used none of the arts necessary for gaining a party among his countrymen. He did not flatter one sect at the expense of another. He neither courted the favour of his countrymen, by inflaming their prejudices against the Romans, on the one hand; nor did he, on the other hand, artfully conciliate the favour of the Romans to be employed as a means towards attaining the sovereignty of Judea. He openly denounced the vices of the reigning sects; and though his benevolence led him to such a course of conduct as could not but excite the admiration of many among the lower orders, he made no attempt to render his popularity subservient to his personal interests; he shunned the demonstrations of popular favour, and unsparingly exposed the unworthy motives that led many to pay court to him. Not a single instance can be mentioned in which he had recourse to any means for establishing a temporal authority. His whole conduct showed that he was animated with more exalted aims. From the commencement of his ministry he asserted his divine commission, and spoke with undoubting confidence of the success of his cause. But the success of which he spoke was not in schemes of worldly greatness, but in the diffusion of truth and righteousness. He availed himself of every suitable opportunity for correcting the erroneous impressions that were entertained respecting the character of the Messias. And so far was he from entertaining views of personal aggrandisement in the character he assumed, that from the very first he intimated that the good he was to render to mankind was to be procured by laying down his life for them. And the tenor of the evangelical history proves, that in proportion to the increasing clearness with which he communicated to his chosen followers the information as to his divine character, was the expressness of his declaration that his death was at hand.

There is only a single instance that can be adduced in which there was any appearance on the part of Jesus, of the assumption of temporal authority, viz. in the case of his last entrance into Jerusalem. This has been represented by Reimarus as an unsuccessful attempt made by him, counting upon the support of the populace, to take possession of the temple and of the city. But such a view is inconsistent, not only with the proceedings of Jesus upon former occasions, but also with his conduct in Jerusalem at that very period. There was no concert between the people and Jesus or his apostles. The city of Jerusalem was filled with strangers from all parts, who had come up to attend the passover; the report of the resurrection of Lazarus had been widely circulated; when Jesus approached, curiosity assembled multitudes to behold him, and, in the enthusiasm of the moment, they rendered homage to him as a king. But Jesus did not avail himself of the feeling that was excited. He addressed to the multitude nothing calculated to rouse their passions. The jealousy of the Roman governor, sufficiently awake to the danger of an insurrection,[2] took no alarm at the approach of the procession to the temple, and Pilate made no allusion to it when Jesus was brought before his tribunal. The same day that Jesus entered into the temple he voluntarily left it for Bethany, though it is obvious, that if he had entertained the views ascribed to him, he would have availed himself of the advantages it presented to him, as the citadel that commanded the whole of Jerusalem.[3] After this he openly returned to the temple on the following days; he made no appeal to the passions of the people, but continued to address to the chief priests such denunciations as could not fail to rouse those vengeful feelings of which he had foretold that he was to be the unresisting victim.

The attempt to prove that Jesus was merely an ambitious adventurer is now generally abandoned. But many, while they admit the excellence of the personal character of Christ, endeavour to account for the supernatural parts of the gospel history on what is called the principle of accommodation, supposing that Jesus suited his proceedings to the expectations of the Jews respecting the miraculous power of their Messias. But to act upon such a principle is surely inconsistent with the simplicity and integrity of a spotless character. It is admitted by the defenders of the hypothesis referred to, that we have in Jesus Christ a character which stands single and alone in the history of mankind, free from any defect, and combining every species of excellence. We have this same Jesus, without advantage of education or outward condition, introducing a system of religion and morals such as the world had never witnessed; the only system of positive religion that does not bear on its face evidence of its falseness; a system to which the most enlightened men in every age since its first propagation have yielded their homage; and a system of morals so pure in its nature, and so comprehensive in its requirements, that while the most extraordinary progress has been made in every other subject, it might easily be proved that all that ethical inquirers have attempted is an analysis of the principles of our nature, on which the rules of the New Testament are founded, or an application of these rules to the circumstances of mankind in new conditions of society. If such a system had been originated by an individual who made no claim to supernatural assistance, we would have been presented with a moral phenomenon altogether inexplicable. But this is not the state in which we find the question. Jesus declares that he received from God all that he reveals to man. Had he offered no proof of this assertion, his moral qualities, even supposing him to have been in error, might have remained unimpeached, and he might have moved our compassionate respect, as the self-deceived enthusiast of virtue or religion. But our Saviour not only demands credence on his own authority; he makes an appeal[4] to the miracles which he wrought, in proof of his divine mission. Now, the miracles which our Saviour refers to are of such a nature, that either they must have been performed or he must have lent himself to a deceit. There is no other alternative. He could not but know whether they were actually wrought, or whether they

---

[1] See, in particular, the *Leben Jesu* by Dr Paulus of Heidelberg, who conceives that his opinion is strengthened by an attempt to prove (which he has endeavoured to do in a separate tract upon the subject) that only the hands of Jesus were nailed to the cross, his feet being merely bound to it by a strong cord. But even supposing this to have been the case, which we consider as by no means established, the evidence of actual dissolution is decisive. We have in the first place the testimony of the Evangelists, then the proceedings of the soldiers in general (John, xix. 33), and then the wound inflicted by one of them with a spear, which, from the account given of it, must have entered the heart itself (v. 34.)

[2] In proof of this, see Joseph. *Antiq.* xviii. 3, 2.

[3] Michaelis.

Jesus.

were only seeming and illusory. And if the miracles were not truly performed, then we have the individual whose moral character stands in all other respects higher than that of any other of the children of men, and who was made the instrument of conferring the greatest boon that ever was made to mankind,—we have that individual guilty of an artful and criminal imposture.

In regard to the theory that the apostles filled up the picture of the character of Jesus from what they read in the Old Testament Scriptures respecting the Messias, it may be remarked, that the conception of such a character in such circumstances is a phenomenon as inexplicable upon ordinary principles as the actual existence of the prototype. And that four different writers, or that even two different writers, without having a common subject, should have given so many points of resemblance of such an extraordinary nature, and in so many varied circumstances, is altogether incredible.

Among those who admit the divine commission of Jesus, different opinions have been entertained as to the rank he holds in the scale of being. The general doctrine of the Christian church, as expressed in ancient creeds and in the confessions of reformed churches, is, that Christ exhibited in his person a union of the divine and human nature; that the second person in the Trinity was united to the man Jesus, who was God and man in one person. To avoid the difficulties which have been supposed to be involved in this mysterious doctrine, it has been maintained by some that the Son is not equal with the Father, and did not exist from eternity, but that the first created being, the highest angelic nature, was made flesh and dwelt on earth. The essence of this theory is, that the Son of God was a *creature*, but that he existed in a separate state previously to his manifestation in the form of man. It is variously modified according to the higher or lower character that is given to the Son of God; and is distinguished by the name of *Arianism*, from the individual who in the early part of the fourth century first brought the question into general discussion. According to a third class, Jesus Christ was a mere man, distinguished from other men only by being employed by God in making a revelation of his will to mankind, and superior in no respect to the prophets who appeared among the Jewish people, except in superior virtue, and in a more enlarged measure of divine countenance and assistance. This view, in its essential features, was embraced by the Ebionites, and also by Artemon and others during the second and third centuries; by Socinus in the sixteenth century, from whose name those who adopt this opinion are frequently named *Socinians*, though they assume to themselves the name of *Unitarians;* a title which is sometimes conceded by Trinitarians for the sake of distinction, though they equally hold the doctrine of the unity of the Deity. In America the name Unitarian is applied to all those who reject the doctrine of the Trinity. The differences of opinion respecting the person of Christ are connected with different views as to the object and nature of his commission. Trinitarians consider him as not only teaching a purer system of morality than the world had before known, but also as making an atonement for human guilt by his death; while Socinians and many Arians deny the doctrine of the atonement, and look upon Jesus merely as a teacher of religion and virtue.

The character of Christ, as exhibited in the Gospels, presents to us the only example, anywhere to be found, of the perfection of humanity; and the contemplation of it has ever been considered by his followers as one of the most edifying and delightful exercises of piety.[1] A constant regard to the will of God, and a delight in doing it, form the distinguishing features of his character. With this was connected the absence of all sordid, or selfish, or ambitious aims, and an enlarged and enlightened philanthropy. There is perhaps nothing more remarkable in the life of Jesus than the apparently inconsistent qualities which are blended together in one harmonious whole. We see in him the most unbending constancy united with great tenderness of feeling—hatred of sin, and compassion for the offender—a heart superior to all the allurements of pleasure, with a condescending indulgence for the innocent relaxations of life—a mind of universal philanthropy, alive to all the domestic charities—views that extended to the whole human race, and a generous compliance with national and individual peculiarities. It is difficult to conceive that the portraiture presented to us in the sacred history can be contemplated without benefit; but the chief benefit will be lost if it is forgotten that he whose life was the model of every virtue laid down that life for the sins of the world.

Those who hold the highest ideas of the divinity of Christ, admit to the fullest extent that he was also man; and the curiosity is not unnatural as to the personal appearance assumed by the Son of God. Upon this subject no direct information is given in the New Testament. From incidental notices, it has been conjectured that he was of a robust frame, and that there was nothing particularly marked in his appearance;[2] but it may be doubted how far the passages referred to bear out these conclusions. There is better evidence that the mixture of divine benignity and commanding authority which he everywhere displayed in his character, were conspicuous also in his voice and aspect.[3]

The most judicious of the fathers agree that nothing was known of the personal appearance of Christ, though inquiry upon the subject was not prohibited. During the first ages of Christianity, the church, under persecution, required a model of patient endurance; and the general opinion of the fathers[4] during that time seems to have been, that the personal appearance of Christ corresponded literally with the description in Isaiah, liii. 2, 3. There was at the same time a prohibition, founded on the second commandment, against attempting to frame any pictorial likeness of the Son of God. We read, however, of pictures of Christ in the hands of one of the Gnostic sects.[5] Alexander Severus had his bust in the chamber set apart for his devotional exercises;[6] and Eusebius relates, that many among the heathens had pictures of Christ and of his apostles, which he himself had seen.[7] At a somewhat later period, when paintings began to be admitted into churches, the attempt to present a likeness of Christ was no longer considered as unlawful; and full scope being given to the imagination of the artist, attempts were made to embody the purity, and elevation, and loveliness of the Saviour's character, in lineaments of extraordinary beauty. Certain theologians justified the attempt by explaining the description in Psalm xlv. as literally applicable to Jesus. There is a minute description of the personal appearance of Christ by the Greek ecclesiastical historian Nicephorus, who flourished about the year 1330; and another in a letter purporting to be addressed by Publius Lentulus, governor of Judea, to the Roman senate. Both of these,

[1] A catalogue of some of the most important treatises upon this subject in English is given by Bishop Newcombe, in the preface to his work on our Lord's conduct and character.

however, are altogether without value. As the *prosopographia* in the pretended letter of Publius is from time to time brought before the public in various forms, without any hint as to its real origin, it may be proper to state, that there is most decisive evidence of its being a mere fabrication. No trace of it is to be found before the fourteenth century. No such person as Publius Lentulus was ever governor of Judea. From the style, it is probable that it was written by some monk in the middle ages.[1]

In regard to pictures which tradition has represented as having been made while our Saviour was on earth, in addition to that already mentioned as having been sent to the king of Edessa, there was another supposed to have been imprinted upon a handkerchief belonging to Veronica. The legend is, that when Christ was led to crucifixion, Veronica, who followed him, put a handkerchief to his face, on which Christ impressed his likeness. This holy relic is still exhibited at Rome on certain festivals.[2] Eusebius speaks of a statue of Christ erected by the woman who was cured of the issue of blood, and mentions that he saw it himself at Cæsarea Philippi.[3] Julian the Apostate is said[4] to have taken it down, and erected his own statue in its place. From the representations on some ancient coins, it has been conjectured that the pillar referred to was originally erected in honour of Hadrian.[5] In the Romish church it is believed that there existed a picture of Christ by St Luke, and that there was an image of him cut out by Nicodemus in cedar wood; but these traditions are without support from antiquity, and inconsistent with many passages in the writings of the fathers. A general resemblance is to be observed in all the pictures of the Saviour; but though this has probably arisen from admiration of one traditional model, there is no evidence whatever of its genuineness. After all our inquiries, while we are warranted in supposing that the benignant majesty which distinguished his character beamed forth in his countenance, yet, in regard to any thing more definite, we must rest in the conclusion of St Austin, "qua fuerit ille facie penitus ignoramus."[6]

(D. D. D. D.)

JESUS, *the Son of* SIRACH, a native of Jerusalem, composed, about 200 B. C. the Book of Ecclesiasticus, called by the Greeks Παναρετος, "replenished with virtue." They also quote it under the title of *the Wisdom of Jesus the son of Sirah.* His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. We have the Greek version, but the Hebrew text is lost.

JESROTCH, a town belonging to the Sikhs, in the province of Lahore, fifty-three miles east from Lahore. Long. 74. 19. E. Lat. 32. 28. N.

JESSELMERE, a large district of Hindustan, in the province of Ajmeer, situated about the twenty-eighth degree of north latitude, and extending to the sandy desert, which constitutes the western boundary of that province. It is a barren country, being for the most part an uninterrupted tract of sand, without rivers, and the wells being of very great depth under ground. Its complete sterility is, however, in some degree owing to the government, as the whole tract is within the limits of the periodical rains, and, if duly cultivated, would be productive. But it is an almost constant scene of hostility, from the number of petty chiefs among whom it is divided. The original inhabitants, in whose possession it still remains, are of the Hindu Brahminical religion, but few in number. The capital is of the same name, and is governed by an independent chief. Long. 72. 16. E. Lat. 27. 44. N.

JESSORE, a district of the province of Bengal, to the north-east of Calcutta, bounded on the north by the Ganges, and on the west by Dacca, Jelalpoor, and Buckergunge; on the south by the sea, and on the east by Kishenagur. In the Ayeen Akberry it is called Khalafabad. The northern part of this district is very fertile; but the southern division is in the Sunderbunds, and composed of salt marshy islands covered with trees. Some parts lie so low that embankments are found necessary to protect them against inundation. The land is fertile, and would produce rice in any quantity. At present, though so near Calcutta, these low-lying tracts are neglected and waste; and being covered with jungle, they are only resorted to by salt-makers and river-pirates, the latter of whom sally out on vessels as they pass any of the innumerable branches of the Ganges by which this marshy country is intersected. The principal towns are Jessore or Moorley, Culna, and Mahmudpoor. In reply to certain queries circulated in 1801 by the Marquis Wellesley, the inhabitants were stated at 1,200,000, in the proportion of nine Mahommedans to seven Hindus. Jessore was formerly the name of the capital; it is now called Moorley.

JET, a black, inflammable substance of the bituminous kind, harder than asphaltum, and susceptible of a good polish. It becomes electrical by rubbing, attracting light bodies like yellow amber. It swims on water, so that its specific gravity must be less than 1000; notwithstanding which it has been frequently confounded with the *lapis obsidianus*, the specific gravity of which, according to Kirwan, is no less than 1744. It also resembles cannel coal in its hardness, receiving a polish, and not soiling the fingers, &c. so that it has also been confounded with this substance. The distinction, however, is easily made between the two; for cannel coal wants the electrical properties of jet, and is likewise so heavy as to sink in water, its specific gravity being no less than 1273, whereas that of jet, as has already been said, is less than 1000.

JET *d'Eau*, a French term, used to signify a fountain which casts up water to a considerable height in the air.

JETTEE', the border made round the stilts under a pier, in certain old bridges, being the same with starling; consisting of a strong framing of timber filled with stones, chalk, or other materials, to preserve the foundations of the piers from injury.

*JETTY-HEAD, a name usually given in the royal dockyards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, the side of which forms one of the cheeks of a dry or wet dock.

JEVER, a circle of the grand duchy of Oldenburg, in Germany, extending over 165 square miles, and containing, in twenty-four parishes, 4140 houses and 20,105 inhabitants. It is a level country, on the sea shore, and preserved from inundation by powerful dykes and sluices.

---

[1] There are several manuscripts of this epistle, none of them, however, older than the fourteenth century. One of these was brought forward about twenty years ago as newly discovered in the library of the Vatican, and treated as a matter of much importance. The subject was taken up in a work entitled "In ἀυθεντια Epistolæ Publii Lentuli ad Senatum Romanum de Jesu Christ. scriptæ denuo inquirit J. P. Gables," 1819, in which the whole question is fully discussed. An exposure of the fabrication is also to be found in the *American Biblical Repository*, vol. ii. p. 367.

[6] *De Trin.* 4, 5.

The capital, of the same name, is a fortified city, containing two churches, 650 houses, and 3460 inhabitants. There is a gymnasium, and the boards for the civil and ecclesiastical affairs of the circle are held here. It has some foreign trade, consisting chiefly in the exportation of corn. Long. 7. 47. 36. E. Lat. 53. 34. 30. N.

JEWEL, any precious stone, or ornament set with precious stones.

Jewels formed part of the ornaments with which the Jews, Greeks, and Romans, especially their ladies of distinction, adorned themselves. So great was the extravagance of the Roman ladies in this respect, that Pliny the Elder says he saw Lollia Paulina with an equipage of this kind, amounting, according to Dr Arbuthnot's calculation, to L.322,916. 13s. 4d. of our money. It is worthy of observation, that precious stones amongst the Romans, and all the ancients, were much scarcer, dearer, and consequently in higher estimation, than amongst us, since a commerce was opened with the Indies. The ancients did not know how to cut and polish them to much perfection; but coloured stones were not scarce, and they cut them very well either hollow or in relief. When luxury had gained ground amongst them, the Romans hung pendants and pearls in their ears; and for this purpose the ears of both sexes were frequently bored. See Ears.

Jewel, *John*, a learned English divine, was born in the year 1522, and educated at Oxford. In 1540, having been created bachelor of arts, he became a noted tutor, and was soon afterwards chosen rhetorical lecturer in his college. In February 1544, he took his degree as master of arts. Having early imbibed protestant principles, he inculcated the same on his pupils; but this was carried on privately till the accession of Edward VI. in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr, then professor of divinity at Oxford. In 1550, he took the degree of bachelor of divinity, and frequently preached with great applause before the university. At the same time he preached and catechised every alternate Sunday, at Sunningwell in Berkshire, of which place he was rector. Upon the accession of Queen Mary in 1553, he was one of the first who felt the effects of the storm then raised against the Reformation; for, before any law was made, or order given by the queen, he was expelled from Corpus Christi College by the fellows, of their own private authority; but he continued in Oxford till he was called upon, under the severest penalties, to subscribe to some of the Catholic doctrines, a call which he submitted to. However, this did not secure his safety, for he was obliged to fly; and, after encountering many difficulties, he arrived, in the second year of Mary's reign, at Frankfort, where he made a public recantation of his subscription to the Catholic doctrines. He then went to Strasburg, and afterwards to Zurich, where he attended Peter Martyr, in whose house he resided. He returned to England in 1558, after Queen Mary's death; and, in 1559, was consecrated Bishop of Salisbury. This promotion was conferred upon him as a reward for his great merit and learning; and another attestation was given him by the university of Oxford, which, in 1565, conferred upon him in his absence the degree of doctor in divinity. In this character he attended the queen to Oxford the following year, and presided at the theological disputations held before her majesty on that occasion. He had before distinguished himself by a sermon preached at St Paul's cross, in which he gave a public challenge to all the Roman Catholics in the world to produce but one clear and evident testimony, out of any father or famous writer who flourished within six centuries after Christ, for any one of the articles which the Romanists maintain against the church of England; and, two years afterwards, he published his famous Apology for this church. In the mean time, he paid particular attention to his diocese, where, in his visitations, he began, and at length perfected, such a reformation, not only in his cathedral and parochial churches, but in all the churches within his jurisdiction, as procured him and the whole order of bishops due reverence and esteem. He was a careful and strict observer, not only of all the flocks, but also of the pastors, in his diocese; and he watched so narrowly the proceedings of his chancellor and archdeacons, and of his stewards and receivers, that they had no opportunities of committing oppression, injustice, or extortion, nor of being a burden to the people, or a scandal to himself. Amidst these employments, however, he neglected the care of his health, to which, indeed, his general course of life was unfavourable. He rose at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about six, he applied so intensely to his studies all the morning, that he could not without difficulty be drawn from them. After dinner his doors and ears were open to all suitors; and it was observed of him, as of Titus, that he never sent any away sorrowful. About nine at night he called all his servants to an account of how they had spent the day, and he went to prayers with them. From the chapel he withdrew again to his study till near midnight, and thence retired to bed, when the gentleman of his bed-chamber read to him till he fell asleep. This watchful and laborious life, without any recreation at all, except what his necessary refreshment at meals and a very few hours of rest afforded him, soon wasted his life. He died at Monkton-Farley, in 1571, in the fiftieth year of his age. He was the author of, 1. A View of a Seditious Bull sent into England by Pope Pius V. in 1569; 2. A Treatise on the Holy Scriptures; 3. An Exposition of St Paul's two Epistles to the Thessalonians; 4. A Treatise on the Sacrament; 5. An Apology for the National Church; 6. Several sermons, controversial treatises, and other works. Bishop Jewel was one of the great champions of the reformed religion, and was to the church of England what Bellarmine was to that of Rome. His Apology was translated by Anne, the second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The same Apology was printed in Greek at Constantinople, under the direction of St Cyril the patriarch. His defence of his Apology, against Harding and other Catholic divines, was held in such esteem, that Queen Elizabeth, King James I. King Charles I. and four successive archbishops, ordered it to be kept chained in all parish churches for public use.

Jewel Blocks, in nautical language, a name given to two small blocks suspended at the extremities of the main and fore top-sail yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is to retain the upper part of the top-mast studding-sails beyond the skirts of the top-sails, so that each of those sails may have its full force of action, which would be diminished by the encroachment of the other over its surface. The halyards, by which these studding-sails are hoisted, are accordingly passed through the jewel-blocks, whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted.

JEWS.

The character and fate of this singular people, in their relation to the Christian faith, belong to other departments of this work. In the present article we shall confine ourselves to a brief outline of the leading events in their annals, as a part of general history. They derive their origin from Abraham, a native of Chaldea, who flourished about 2000 years before the Christian era. At that period the whole world was sunk in idolatry, and Abraham was chosen by the Almighty, that by him and his posterity the knowledge of the essential principles of true religion might be preserved on the earth, and the way prepared for the revelation of a more comprehensive system to mankind. Under the divine direction, Abraham, at an early period of his life, withdrew from his country and kindred, and from the infectious influence of their superstitions; taking up his abode in the country now known by the name of Palestine, a small stripe of land along the Mediterranean, naturally sterile and rugged, but capable of extraordinary fertility through attentive culture, and commanding advantages, by its local situation, for securing an easy intercourse with the whole habitable world. In the days of Abraham, part of it was altogether unoccupied, and the rest was inhabited by different small tribes of the Canaanites, who seem to have migrated from Arabia. Among these, Abraham lived as an Emir or chief of a nomadic tribe, moving from place to place, as the increase of his flocks and the condition of his dependents required. A similar course of life was pursued by his immediate descendants, who, amidst their increasing numbers and enlarged possessions, did not depart from the habits of pastoral simplicity; so that during the period of 215 years, from the time of the arrival of Abraham till the departure of Jacob into Egypt, little progress seems to have been made in the arts of civilized life. The migration referred to, of all the descendants of Abraham, was occasioned by the well-known promotion of Joseph in the court of the king of Egypt. The Egyptians at this period were living under a regular form of government, and had made considerable advances in the arts and sciences. Policy as well as habit led them to look upon the nomadic life with an unfavourable eye; and from this circumstance, as well as from the hereditary character of offices among the Egyptians, the two races were kept entirely distinct. A separate district of the country was assigned to the Israelites, where they retained to a considerable extent the character of a pastoral tribe; the Egyptian deserts, and the neighbouring country of Arabia Petræa, affording ample opportunities for indulging in their primitive customs. The ordinary influence, however, of a more civilized and powerful people upon their dependents or allies, by degrees became perceptible; and we find the Israelites beginning to practise some of the arts of the Egyptians, and falling gradually into their idolatry. Gratitude or contempt secured the descendants of Jacob from the jealousy that their increasing numbers was calculated to awaken, till the founder of a new dynasty perceived the full extent of the danger to which his usurped dominion was exposed, and, regardless of national obligations, formed a plan for the extermination of the dangerous visitors. The rigour with which his savage plan was carried into execution, led to events by which it was frustrated, and proved the occasion of the establishment of the Israelites as a separate and independent people. Under the visible interposition of the Most High, Moses, who had been marvellously preserved from becoming the victim of the royal mandate, gave a new aspect to the destinies of the race. He led forth his countrymen from the house of their bondage, delivering to them a body of laws and institutions, which not only gave an indelible stamp to the Jewish character, but exerted an influence that continues to be experienced throughout the Christian and Mahommedan world. Like other lawgivers, he appointed religious ceremonies to be mingled with political institutions, but with this remarkable difference, that while under other systems religion is used as a means for civil security, the institutions of political society were employed by Moses to give permanency to the doctrines and practices of a pure theology.

The plan which had been entered upon by Moses for the introduction of the descendants of Abraham into the land promised to their progenitor, was carried into effect by Joshua, who succeeded to Moses; and who proceeded against the tribes which now inhabited that country, with a severity that can be condemned only by those who forget or deny the authority under which he acted, or the atrocious wickedness which warranted or called for the extremest manifestations of the divine displeasure. The command for the total destruction of the Canaanites, however, was only partially executed; and many of the evils which afterwards befell the Jewish people arose from the example of the families which had been spared with an ill-judged and presumptuous clemency. Many of the tribes also seem to have saved themselves by a timely flight, which it does not appear that the Israelites were called upon to interfere with. Procopius mentions that the peopling of Northern Africa by the Phœnicians took place in consequence of the flight of that people before the victorious Joshua.

Possession being taken of the land of Canaan, it was parcelled out among the twelve Israelitish tribes, which were to a certain extent independent of each other, though, descended from the same stock, and worshipping at the same shrine, and united by certain general interests, they formed but one nation. Their government was strictly theocratical, without, however, excluding the ordinary forms of earthly rule. During the life of Joshua, the supreme power was exercised by that individual, as it had been by Moses, under the sanction of divine appointment, with the assistance of certain ordinary magistrates. From the death of Joshua, during a period of 450 years, in the absence of a regular succession of recognised rulers, the civil constitution of the confederated tribes was fluctuating and uncertain. Their common origin and religion, the chief bonds of their union, often proved too feeble to withstand the influence of local interests and jealousies. Single tribes followed their own views, to the neglect of the common wishes or the common weal; leagues formed between two or more tribes for special purposes awakened the suspicions of their neighbours; these circumstances were aggravated by hereditary rivalries; and the government was preserved from dismemberment only by the rulers or Judges whom Providence upon great emergencies raised up to undertake the cause of the people, defending them from their enemies, or preserving them from intestine commotions.

At last the people, impatient of the uncertain government which seemed to be exerted over them, resolved upon the establishment of a monarchy, which might unite all in one peaceful kingdom. A member of the tribe of Benjamin, named Saul, was raised by common suffrage to the sovereignty, and held the sway over all the tribes of Israel about forty years. His reign was far from being either prosperous or happy; and though his bravery preserved the Israelites from external adversaries, he was deficient in that political sagacity which was necessary to consolidate the principles of the new monarchy. Upon his death, the tribes of Judah and Benjamin refused to acknowledge the authority of his son, and elected as his successor a youth named David, who had been marked out by the prophet Samuel as destined to kingly honours, and whose adventurous exploits, generous enthusiasm, and princely bearing, had endeared him to his tribe. His prudence proved equal to his valour and his piety; and in a short time he succeeded in uniting all the tribes in one kingdom, fixing his capital at Jerusalem. He was succeeded by his son Solomon, under whose reign the kingdom of Israel was carried to its highest degree of prosperity. The descendants of Abraham now formed the principal monarchy in Western Asia. From the Mediterranean Sea to the Euphrates, from the river of Egypt to Berytus, and towards the east to the Hagarenes on the Persian Gulf, all were subject to the sway of Solomon, under whose wise and peaceful rule trade flourished, commerce was extended, and the arts and sciences found patronage and protection. It often happens, that when a prince like David has settled a kingdom on solid foundations, his son is induced to indulge a taste for luxurious magnificence; and to this, as well as to his sense of religion, some have ascribed the building of the temple, the great event of his reign.

Upon the death of Solomon, the kingdom fell asunder under the feeble and impolitic sway of his son and successor Rehoboam. The causes of disunion lay deep in the character and situation of the different tribes; and, though counteracted for a time, they were ever ready to operate when occasion was afforded. The jealousy that subsisted between the twelve sons of Jacob seems to have been inherited by their descendants; but it was only among the more powerful tribes that such jealousies could lead to a dismemberment of the commonwealth. From the beginning a rivalry may be observed between the tribes of Joseph and Judah. The former inherited a double portion in the allotments to Ephraim and Manasseh, the two sons of Joseph; and their founder had been distinguished from his brethren by the blessings pronounced upon him. The tribe of Judah had the right of primogeniture, and the promised Messias was to spring from them. In this way the two tribes regarded each other with ill-concealed sentiments of hostility; and Shechem and Jerusalem, their respective capitals, were each the focus of a party ready to engage in active warfare. The impolitic exactions of Rehoboam, while they gave dissatisfaction to all his subjects, inflamed the Ephraimites to open revolt, which, fomented as it was by the ambition of Jeroboam, terminated in the establishment of a separate kingdom. This kingdom comprehended all the tribes, with the exception of the two southernmost (those of Judah and Benjamin), together with all the tributary nations as far as the Euphrates. The royal residence in the new kingdom was in Shechem, where the Mosaic ritual was superseded by a new mode of worship, and the link that bound Ephraim and Judah together finally severed.

The kingdom of Israel, as distinguished from that of Judah, had a distinct existence about 235 years, when it was invaded by Shalmaneser, who carried away the principal inhabitants into captivity. From that period all traces of the ten tribes as a distinct people are in a great measure lost. Colonists from Babylon and other eastern cities mingled with the Israelites who were left in the land of Palestine, and the mixed race were afterwards known by the name of Samaritans.

The kingdom of Judah enjoyed a somewhat longer existence than that of Israel. At last, however, about 135 years after the transference of the ten tribes to Media, the king of Babylon carried away captive the inhabitants of the land of Judah, which was left for a time wholly desert, or occupied only by wandering tribes.

During the captivity of Judah, the vanquished people seem to have enjoyed a more than usual share of the favour of their conquerors, and were considered more in the light of colonists than of captives. They were not, as they had been in Egypt, confined to a separate territory, but mingled freely with the Babylonians; being settled in thinly peopled districts, where, by a moderate degree of industry, they found an abundant sustenance. Upon the banks of the Euphrates they met some of the expatriated Israelites, who attached themselves to the tribes that had adhered to the pure worship of their fathers; and the name of *Jews*, from the larger tribe, was applied from this period to all who were recognised as the descendants of Jacob. The wisdom of many of the institutions of Moses now appeared, as they preserved the Hebrews a distinct people, notwithstanding the most intimate intercourse with another race, and secured their attachment to the great principles of monotheism in the midst of prevailing idolatry.

The captivity of the Jews continued till the year 536, when Cyrus ascended the Medo-Persian throne. This great prince had been foretold by the Jewish prophet Isaiah, as the man from whom deliverance was to come to the captive people; and in the first year of his reign he proclaimed a decree, permitting, or rather inviting, all the people of the God of Heaven, without exception, to return to Judea, and rebuild the temple of Jerusalem. About 50,000 availed themselves of this permission. They assembled at an appointed place, according to the usual mode of collecting a caravan, and proceeded under the conduct of Zerubbabel, who was nominated leader of the caravan, and governor of Judea. The return to Jerusalem took place about the close of the first year of Cyrus, after seventy years of captivity.

The building of a new temple, and the rebuilding and fortifying the city, were the two national objects which the restored captives had most at heart; and in the second year of their return the foundation of a new temple was laid. The jealousies and enmities, however, of the colonists at Samaria presented obstacles to the advancement of the work, and for a time it seems to have been abandoned. This lukewarmness on the part of the people called forth the indignant expostulations of the prophets Haggai and Zechariah, which were attended with such effect, that, by the joint application of Zerubbabel the governor, and Jeshua the son of Josedek the priest, the original decree of Cyrus was renewed by Darius, one of his successors, and the temple was finished without farther interruption. The obstacles towards restoring the city of Jerusalem were not so soon overcome. The fears of the Persian government were wrought upon by the representations of the Samaritans, as to the danger of the defection of the Jews if their city were again fortified; and thus, though Ezra was allowed by Artaxerxes Longimanus to take with him to Jerusalem as many of the Jews of Chaldea as were disposed to return, his powers, though considerable, did not extend to the fortifying of the city. It was not till the death of Zerubbabel, about twelve years after the return of Ezra, that Nehemiah was appointed his successor as governor of Judea, with authority to repair the city and rebuild the walls. This change in the policy of the Persians towards the Jews has been ascribed to the humiliating conditions of the peace which Artaxerxes was obliged to make with the Athenians after the signal defeat of his forces by Cimon, by which conditions no Persian army was to approach within three days' march of the sea. Being thus excluded from the line of sea-coast, it became an object to the Persians to have a fortified town like Jerusalem in their interest, which, without infringing upon the treaty with the Athenians, might serve as a pass for keeping open the communication between Persia and Egypt, which latter country had been reduced

Jews. anew under the Persian yoke. The extraordinary rapidity with which Nehemiah executed the important trust committed to him, the abuses which were introduced upon his return to Persia, and the steps which he took in consequence for the restoration of the Mosaic polity, and which he completed in the reign of Darius Nothus, are set forth in the book which bears his name, which, with that of his contemporary Malachi, closes the Old Testament canon,

From the time of the return from the Babylonian captivity, a remarkable change is observable in the character of the Jews, and in the features of their policy, civil and ecclesiastical. The infliction of the judgments threatened in their sacred books for their disobedience, seems to have impressed upon their minds a deeper reverence for the institutes of their Great Lawgiver; while the fulfilment of the predictions respecting their restoration to their own country led them to direct their views to the prophecies which spoke of the whole earth being brought to acknowledge the sovereignty of the God of Jacob. Of the tendency to idolatry, accordingly, for which they had hitherto been distinguished, we find few farther traces; and it was succeeded by a scrupulous adherence to the Mosaic ritual, on the observance of which they built their hopes of the accomplishment of the divine promises to their nation under the expected Messias. This change was connected with certain alterations in their institutions, which exercised a decided influence upon the destiny of the Jewish people in succeeding times. We refer to the establishment of the national councils known by the name of the Sanhedrims, and to the introduction of the synagogue worship. The precise period of their origin cannot be ascertained, but it seems not improbable that it was almost as early as the time of the return from Babylon, though a considerable period intervened before either system was in full operation. It has been conjectured that Nehemiah, in the conduct of his government, sought the assistance of a council or senate, consisting of the most influential individuals in Jerusalem; and that, in imitation of this national council, smaller senates were formed by degrees in each separate district, conducting the affairs of the community under the authority of the great Sanhedrim. These councils were intimately connected with the synagogues. As the Mosaic law was made to extend to all the actions of civil as well as to the duties of religious life, the Scriptures became of constant reference in each community. The people assembled to hear it read and explained as a religious exercise; and as it was the statute-book of the magistrate, its true meaning and right application to the circumstances which occurred became a matter of daily consideration. This gave rise to a class of men qualified for the important office of explaining the law. Skill in this department became the great distinction to which all paid reverential homage; and the direction of the worship of the synagogue, and the conduct of the courts of law, fell under the authority of the learned doctors or scribes, in whom were united the professions of law and of divinity. This was followed by a loss of power on the part of the priests, who became little more than the ministers of the sanctuary, without any authority as leaders of the people. Such was the great change effected in the course of a few centuries after the return from the captivity. The power of the priests passed into the hands of the rabbis; and instead of the schools of the prophets, and worship on high places, we have the Sanhedrims and the synagogues. The Jews who remained between the Tigris and the Euphrates, and those also who from this period began to scatter themselves throughout Egypt, Syria, and Asia Minor, and, at a later period, over Greece and Italy, and the other parts of the western world, adopted or carried along with them the synagogue service. While their personal interests prompted them to wander over different lands, a common feeling united them all to the country promised to their fathers, and to the hopes connected with its possession. These expatriated Jews conformed themselves to the regulations prescribed from time to time by the learned doctors of Judea; they contributed to the support of the services of the temple so long as it remained; and by these means, and by avoiding all intercourse by marriage with other nations, the Jews were distinguished as a separate people over all the world, and the spirit was confirmed which has preserved them from being confounded with others even to the present time.

After the death of Nehemiah, Judea was annexed to the prefecture of Syria, the administration of Jewish affairs being left to the high priests, subject to the control, however, of the provincial rulers. In this condition the Jews continued till the overthrow of the Persian empire by Alexander the Great, when Jerusalem became subject to the power of that mighty conqueror.

Upon the death of Alexander, the peace and security which the Jews had enjoyed under the Persian dynasty were changed for scenes of bloodshed and devastation. In the wars which took place amongst the successors of Alexander, Judea, from its situation between Syria and Egypt, became alternately the prey of each. In the words of Josephus, the Jews resembled a ship tossed by a hurricane, and buffeted on both sides by the waves, while they lived in the midst of contending seas. At first their country was allotted to Laomedon, along with Cœle-Syria and Phœnicia. But the ambitious views of Ptolemy Lagus, king of Egypt, being directed to the whole of Syria, he entered Judea, and choosing the Sabbath day for the assault of Jerusalem, he met with no resistance from the inhabitants, 100,000 of whom he carried off as captives, settling them in Cyrene and Alexandria; thus laying the foundation of the Jewish colony in Alexandria, which for 400 years holds a conspicuous place in the Jewish annals. With the exception of the period when Judea was overrun by Antigonus, it continued under the power of Ptolemy, whose policy towards the Jews was wise and liberal. During the reign of this prince, Simon the Just was high priest, who, according to Jewish tradition, was the last member of the great synagogue, and in this character completed the sacred canon. Ptolemy Lagus was succeeded by Ptolemy Philadelphus as king of Egypt. Under his reign the translation of the Hebrew Scriptures into the Greek (named the Septuagint, from an idle legend as to the number of individuals employed in the work) was probably begun, though not completed till a later period. During the wars of Antiochus the Great with the Ptolemiés, the inhabitants of Judea were subjected to severe suffering. Their country was laid waste, and to which side soever victory inclined, they were equally exposed to injury. Though they had received many favours under the sway of the Ptolemies, the Jews espoused the cause of Antiochus, who showed his gratitude by lightening their burdens, by gifts towards defraying the expenses of their sacrifices, and by securing them in the peaceable observance of the rites of their religion.

A very different policy was pursued by Antiochus Epiphanes, who, in all his dealings with the Jewish people, was influenced only by his rapacity, and bigotry, and cruelty. The first act of his reign was to depose the high priest Onias, that the vacated office might be conferred upon Joshua, brother of Onias, who had bribed the king to this injustice by the promise of a large tribute, to enable him to pay which, certain privileges were conferred on him, to be employed in introducing Grecian customs among his countrymen, and in weaning them from their national pe-

Jews.

culiarities. The new high priest assumed the Grecian name of Jason, allowed the services of the temple to fall into disuse, and established a gymnasium, where, under the pretext of practising athletic exercises, the Jews were won over to heathenism. Jason was soon supplanted in his turn by his brother Menelaus, who, in like manner, made it his aim to substitute Grecian for Jewish customs. In the mean time, the attention of Antiochus was attracted towards Egypt, which he invaded with a powerful army that was everywhere victorious. While there, exaggerated reports reached him of a revolt of the Jewish people, and his arms were immediately directed against Judea. Jerusalem was taken; 80,000 of the inhabitants were sold as slaves or put to the sword; and, while he plundered the temple of all its treasures, he showed his enmity against the Jewish religion by desecrating with every abomination all that the Jews esteemed most holy. After this, he anew directed his attempts against Egypt. For a time success seemed doubtful; but the weaker party made an appeal to Rome, and the firmness of Popilius Lenas compelled Antiochus to submission and retreat.

Disappointed in his designs against Egypt, Antiochus returned to his capital, where he issued a decree commanding all the inhabitants of his empire to worship the gods of the king, and to acknowledge no religion but his. It may be doubtful whether in this edict the sovereign consulted most his rapacity or bigotry. At that time the temples were not only enriched by the offerings of the votaries, but, from the security afforded by the character of their sanctity, were the great banks of deposit; and Antiochus seems to have laid the plan for plundering the temples throughout his dominions, after suppressing their worship. Among his heathen subjects, the decree met with ready obedience. The compliance in Judea, however, was not universal, and the partial opposition which was made led to those measures of frantic severity on the part of Antiochus that awakened into life the spirit of the Maccabees, whom God raised up among their degenerate countrymen to defend his cause, and give an example to mankind.

A Grecian named Athenæus, well acquainted with all the forms of heathen worship, was sent to Jerusalem to instruct the Jews in the religion they were henceforth to observe, with full powers to enforce compliance. He dedicated the temple to Jupiter Olympus; the statue of Jupiter (the abomination of desolation spoken of by the prophet Daniel) was set up on the altar of Jehovah; and throughout all Judea idol altars were erected, upon which, under penalty of the most barbarous tortures, the Jews were compelled to offer sacrifice. Circumcision, the keeping of the Sabbath, and other observances of the ceremonial law, were made capital offences, and all the copies of the sacred books that could be found were destroyed. Groves were planted and idolatrous altars erected in every city; and at fixed periods the citizens were required to offer sacrifice, and to join in the religious processions; and officers were sent into all the towns, attended by a military force, to command obedience to the royal edict. At first they met with no opposition; but the hour of resistance was approaching. We learn from the first book of the Maccabees, that when the officers of King Antiochus, in traversing Judea, came to the city of Modin to make the people sacrifice, they commanded Mattathias, a priest of the sons of Joarib, to *come first* and fulfil the king's commandment. "Mattathias answered with a loud voice, God forbid that we should forsake the law and the ordinances: We will not hearken to the king's voice to go from our religion, either to the right or to the left. Now, when he had left speaking these words, there came one of the Jews, in the sight of all, to sacrifice on the altar which was at Modin, according to the king's commandment. Which thing, when Mattathias saw, he was inflamed with zeal, and his reins trembled, neither could he forbear to show his anger according to judgment; wherefore he ran and slew him upon the altar. Also the king's commissioner, who compelled men to sacrifice, he killed at that time, and the altar he pulled down. Thus dealt he zealously for the law of God, as Phineas did unto Zambri the son of Salom. And Mattathias cried throughout the city with a loud voice, saying, whosoever is zealous of the law, and maintaineth the covenant, let him follow me. So he and his sons fled unto the mountains, and left all that they ever had in the city."

Such was the commencement of that noble stand which Mattathias and his sons made for the religion and liberties of their country. Mattathias was the son of John, the son of Simeon, the son of Asmoneus, from whom the family had the name of *Asmonean*. Different accounts have been given of the name of *Maccabee*, by which they are more generally known. The common explanation is, that it was from the four initial letters of the words which were displayed on their banner (Mi Chamoka Baelim Jahoh, who is like unto thee among the gods, O Lord). Others conceive that it was the surname given by Mattathias to one of his sons, on account of his valiant exploits,—*the Hammerer*.

Having fled to the mountains, Mattathias was soon joined by associates from all parts of the country, who needed only a leader to animate them to resistance. Mattathias lived but a short time to direct the energies of this devoted band; but upon his death he left fit successors in his valiant sons, who, during a period of twenty-six years, maintained a war with five successive kings of Syria, which terminated in the establishment of the independence of their country. Judas Maccabeus, the third son of Mattathias, was the first who undertook the management of affairs. His successes were for a time uninterrupted. From a petty revolt, the contest soon assumed the character of a mighty war; the chosen generals of Antiochus were defeated at the head of assembled hosts; in less than three years Jerusalem was once more in the hands of the Jews, its altars repaired, its temple purified, and the sacred services restored; and, soon after the death of Antiochus, the Syrians were compelled to conclude a peace with the Maccabee.

Had the Jews been united among themselves, they might now have defied the power of their enemies. But there were many elements of disunion in this ill-fated nation. The zealous attachment to their ceremonial and traditionary law, which animated the greater part of the followers of Judas, and which was one great cause of their success, was offensive to the party which had arisen with less rigid views, and who were afterwards distinguished by the name of Sadducees; and there was a numerous party, who, having conformed to the Grecian worship, were wholly in the interest of the Syrians. The Syrians were not slow in availing themselves of these internal differences, and war again began to rage. Though deserted by many of his followers, success still attended the arms of Judas, till he was slain in a furious conflict with the flower of the army of Demetrius, which with desperate resolution he had attacked near Azotus with only eight hundred men.

Judas was succeeded in command by his brother Jonathan. He fought at first with various fortune; but the prudence and enterprising valour of which he partook in common with the whole family were crowned at last with success. In the contests for the crown of Syria between Demetrius and Alexander Balas, the alliance of Jonathan was courted by the rival parties; and he was thus enabled to make terms most favourable for Judea. But in the wars that succeeded the death of Balas, he was treacherously slain by Trypho, who, under professions of friendship, had tempted him to enter Ptolemais without a sufficient force for his protection.

Simon was now the only brother who survived of the house of Mattathias; but the fate of his family did not daunt him, and he at once accepted of the hazardous pre-eminence to which the suffrages of his countrymen called him. "Since all my brethren," said he, "are slain for Israel's sake, and I am left alone, far be it from me to spare my own life in any time of trouble, for I am no better than my brethren; doubtless, I will avenge my nation and the sanctuary, and our wives and children." The pledge thus given he soon fulfilled. With characteristic energy, he put the whole country in a posture of defence; and entering into a league with Demetrius, the rival of the perfidious Trypho, he secured such privileges for the Jews, that from this period, B. C. 143, they date their freedom from the Syrian yoke. At this time the Jews elected Simon ethnarch or prince, as well as high priest; the office to be hereditary in his family. The government of Simon was marked by vigour and wisdom. But, like the rest of his family, he was doomed to a violent death, being assassinated at an entertainment by his own son-in-law, who had entered into a plot with Antiochus king of Syria, for the extirpation of the Maccabean race. Two of his sons were murdered with him; but a third escaped to Jerusalem, where he succeeded to his father's government. This was John Hyrcanus, whose surname was derived from his valiant exploits in Hyrcania, with Demetrius king of Syria. The reign of Hyrcanus lasted thirty years, and was eminently prosperous. The kingdom of Judea was extended on every side. Samaria was reduced, and the temple on Mount Gerizim destroyed. The Idumeans were subdued, and became proselytes to the Jewish religion. A league with the Romans, which had first been sought by Judas Maccabeus, and was renewed by Simon, was now confirmed on terms most advantageous to the Jews in their relations with surrounding states; and the glory of the Asmonean princes was raised to its height.

About the time of Hyrcanus we first find mention made of the Sanhedrim or Great Council, which for a considerable period exercised a power, partly legislative and partly judicial, among the Jews. It consisted of seventy individuals, priests and men learned in the law. Some have conjectured that it owed its origin to the policy of Hyrcanus, who wished to avoid the appearance of exercising an unlimited authority, by an institution which might protect, while it seemed to limit, the new monarchy.

The sons of Hyrcanus were unworthy of the stock from which they sprung. The short reign of his eldest son Aristobulus, which lasted only a year, was darkened by monstrous crimes. By his orders his own mother was imprisoned and starved to death, and his brother Antigonus was assassinated. An agony of superstitious horror at the enormity of his guilt, terminated his miserable existence. His brother Alexander Jannæus, who succeeded him in the government, was a man of enterprising valour, but cruel, deceitful, and tyrannical. The greater part of his reign was occupied in quelling revolts among his subjects, occasioned partly by the turbulent spirit of the Pharisees, but chiefly by the oppressiveness of his own sway. Immediately before his death, which was hastened by intemperance, he urged his queen Alexandra to unite herself to the Pharisaic party, as the only means to preserve the kingdom. The policy was wise for the house of the Asmoneans, and was scrupulously followed by Alexandra. Her reign, which continued nine years, was conducted with prudence and vigour, and her kingdom preserved in tranquillity.

Upon the death of Alexandra, her two sons, Hyrcanus and Aristobulus, were both competitors for the vacant throne. Hyrcanus was deficient in all the qualities that were necessary for command, and would have yielded to his brother without opposition, had he not been urged by Antipater or Antipas (father of Herod the Great) to maintain his cause. According to Josephus, Antipas was of a noble family of Idumeans who had adopted the Jewish religion. His father had been governor of Idumea during the reigns of Alexander Jannæus and Alexandra. Antipas himself was educated in the Jewish court, where he attached himself to the interests of the eldest son, whom he looked upon as the successor to the throne. The arts of Aristobulus, who, in the prospect of his mother's death, had made himself master of several of the strongest fortresses of Judea, presented an unexpected obstacle to the hopes of the friends of Hyrcanus. The prize, however, was too important to be lost without a struggle; and Hyrcanus, under the influence of Antipas, engaged in a contest for the throne. It was continued for a considerable time with doubtful issue. At last the brothers submitted their claims to the decision of Pompey, now crowned with all the glories of the Mithridatic war. Pompey delayed from time to time pronouncing in favour of either party, till at last Aristobulus, disappointed in his hopes of the support of the Roman, took up his ground in Jerusalem, and prepared for war. Upon this Pompey marched against the Jewish capital, which, after a siege of three months, was taken by assault. Had it not been for the religious scruples of the Jews as to making resistance to the progress of the works of the enemy on the Sabbath, the fortress might have proved impregnable. The attachment of the Jews to their sacred ceremonies was strikingly evinced at this period in another respect. At the moment when the temple was taken, the priests were engaged in the daily sacrifices; and, amidst all the horrors which surrounded them, they proceeded in their solemn services unmoved, thinking it better, says Josephus, to suffer whatever came upon them at their very altars, than to omit any thing that their law required of them. The curiosity of Pompey led him to visit the whole of the sacred edifice, and he entered into the holy of holies. The sacred utensils of the temple he left untouched, and even the treasures, which amounted to two thousand talents of gold. He also gave orders for the purifying of the temple, and for the continuance of the divine service as before. He appointed Hyrcanus to the office of high priest, giving him at the same time the government of Judea, tributary to the Romans, but without the title or ensigns of royalty. The cities of Phœnicia and Cœle-Syria, which the Jews had conquered, were separated from Judea and joined to Syria, which was now made a province of the Roman empire, Judea being reduced to a subordinate principality. B. C. 63.

Aristobulus, his sons Alexander and Antigonus, and his two daughters, were carried away by Pompey as prisoners to grace his triumph, Hyrcanus being left as governor of Judea. This feeble prince was wholly under the influence of Antipater the Idumean, by whose instigation he had made the effort which gave him his present supremacy. Unfit himself to hold the reins of state, he intrusted every thing to this crafty and ambitious favourite, who appointed his own sons, Phasaelis and Herod, the one governor of Jerusalem, the other of Galilee, though both nominally under the control of Hyrcanus. Herod, at this time only twenty-five years old, commenced his government with a vigour and severity that bespoke the future tyrant. A band of robbers who infested his province were made the first victims of his cruelty; and when summoned before the Sanhedrim, who were jealous of the rising powers of Antipater and his sons, to answer for his stretch of authority, he entered the council in so menacing a form, that all, with the exception of one individual, were awed into silence. The attack which the discontented Jews were afraid to commence openly, they soon after attempted in secret, and the leading men among them entered into a plot for the destruction of the family of Antipas. The father was poisoned at an entertainment given by the high priest; and when Herod and Phasaelis escaped the snare which was laid for them, means were used to alienate from them the affections of Hyrcanus. These arts, however, were baffled by Herod, who contrived to increase his influence with the prince by marrying his grand-daughter Miriam or Mariamne. The enemies of Herod now openly espoused the cause of Antigonus, son of Aristobulus, who had lately effected his escape from Rome, and who had found a supporter of his pretensions to the Jewish throne in Pacorus, the Parthian leader. In the war which ensued, Hyrcanus, with the assistance of the sons of Antipas, was generally successful. But, under the pretence of coming to an amicable arrangement, Hyrcanus and Phasaelis were entrapped into the enemy's camp, where Phasaelis was put to death, and the barbarous punishment of cutting off the ears was inflicted upon the aged governor by his unfeeling nephew Antigonus.

The discovery of this treachery aroused the energies of the surviving brother to the uttermost. Having placed his family, and whatever of value he could collect, in Massada, a fortress on a mountain near the Dead Sea, he sailed to Italy to implore the assistance of the Romans. In all the changes which had taken place at Rome, it had been the policy of Herod to ingratiate himself with the successful party. And it is a sufficient proof of the arts and talents of this extraordinary man, that he enjoyed the favour of Julius Cæsar, and Cassius, and Mark Antony, and that he was ranked as one of the friends of Augustus and Agrippa. At the present time Antony was in power at Rome. And when Herod asked merely that the brother of Mariamne should be placed on the throne of Judea, as uniting by his descent the claims both of Hyrcanus and Aristobulus, Antony named Herod himself the king. Before the end of the year Herod was again in Judea, raised a large body of soldiers, relieved his friends at Massada, and was in readiness to take the field against Antigonus. The war continued about three years, in the course of which Jerusalem again stood a long siege. When it was at last taken, the Romans, exasperated at the obstinacy with which it had been defended, would have made a general massacre, and reduced the city to ashes, had they not been restrained by Herod, who complained that "they were going to make him king of a desert." The pusillanimity of Antigonus upon his surrender subjected him to the scorn of the Roman general, who sent him in chains to Antony, under the contemptuous name of Antigona, as if he were unworthy to bear that of a man. Antony, at the cruel but perhaps politic solicitation of Herod, gave order for his execution as a common malefactor, by the rods and axe of the lictors. With Antigonus ended the Asmonean dynasty, after it had subsisted 126 years. Josephus expatiates with a natural pride upon the merits of this illustrious house, as distinguished by their descent, by the dignity of the pontificate, and by the great exploits of their ancestors.

Upon the accession of Herod to the Jewish throne, his character began more fully to develope itself. By one of the first acts of his reign, the whole of the members of the Sanhedrim were put to death, with only two exceptions. One exception was in favour of Sameas, the individual formerly referred to as standing alone in arraigning Herod to his face. If there was any generosity in the conduct of Herod towards Sameas, he forfeits the admiration it might have excited, by his unworthy jealousy of Aristobulus, the brother of his wife Mariamne. When the popular feeling was manifested in their admiration of the rightful heir of the Asmoneans, Herod saw in him a dangerous rival to his power, and by his order the youthful high priest was put to death. The mother of Aristobulus appealed to the justice of Antony to avenge the murder of her son. Herod saw his danger, and secured his safety by the homage of a personal interview. The battle of Actium put an end to his farther hopes from Antony, and his crown and even his life were exposed to a new jeopardy. He resolved therefore once more to have recourse to the expedient of a personal interview; he presented himself before Augustus upon his arrival in Egypt; and the arts which had formerly prevailed with Roman generals were still successful. But the qualities by which he was able to attach to himself many illustrious friends, and the munificent acts and proud and princely undertakings which shed a barbaric splendour over his reign, formed no atonement for the many deeds of blood by which he had arrived at his guilty pre-eminence. His crimes, however, were not allowed to pass unpunished. He regarded not how much misery might be endured by others, that his own passions might be indulged; and in those passions his guilt found its avengers.

When he left Judea to plead his cause before Antony, he gave the extraordinary injunction, that if he were condemned, Mariamne should be put to death, to prevent the possibility of her ever being the wife of another. And during his absence at the time when he paid his court to Augustus, he gave the same instructions; his love being such, that he could not think of Mariamne but as his own; if the name of love can be applied to that combination of tyranny, and pride, and selfishness, and lust, which filled his guilty bosom. The fatal secret had been communicated to the queen during his first absence, and upon his return she upbraided him with his barbarous cruelty. The jealousy of the tyrant was awakened in a moment, and, wild with rage, he rushed upon her with his sword, asking if such a secret could have been revealed except by a lover. But the paroxysm passed away, and his suspicions were forgotten in his efforts to soothe the resentment of his injured queen. Upon his second return he found that his secret had again been disclosed; and, goaded on by the enemies of Mariamne, he issued orders for her execution. Remorse and despair now took possession of his mind. He fled from all society, and, under a complication of mental and corporeal suffering, he sunk into a state of insanity. The derangement was temporary, though traces of it were discoverable to the end of his life.

As the sons of Herod by Mariamne grew up to manhood, attempts were made to poison the mind of their father against them; and the obvious interest with which they were viewed by the Hebrew nation awakened his jealousy. After a succession of scenes, in which the tyrant and the father strove for the mastery within him, he appeared as the accuser of his own sons, first before Augustus, and then before the deputies Saturninus and Volumnius; and the sanction of the Roman authority being obtained, the unhappy brothers were strangled by the orders of the unhappier father. Macrobius has preserved a saying of Augustus upon hearing of the unnatural conduct of Herod, in allusion to the Jewish faith, "that he would rather be Herod's *sow* than his *son*." Antipater, his son by a former marriage, who had instigated the proceeding against his brothers, was himself found guilty of a plot to poison Herod. Sentence of death was immediately pronounced against him, but the tyrant's own death prevented it from being carried into effect.

Amidst the dark shades of the character of this extraordinary man, the splendid acts of his administration are not to be forgotten; the fortresses by which he sought to give security to his kingdom; the harbours he constructed; the cities he built; the magnificent palace he reared for the royal residence; and the temple which he restored to almost its original greatness. The rebuilding of the city of Samaria, the building of the city and harbour of Cæsarea, with the rebuilding of the temple, must be allowed to be monuments of a princely and patriotic mind.

Upon the death of Herod, Palestine was divided amongst his three surviving sons, Archelaus, Antipas, and Philip. Archelaus was appointed ethnarch or governor of Judea, Idumea, and Samaria, which formed the largest part of the province. Antipas was named tetrarch of Galilee, and Philip tetrarch of Trachonitis. Archelaus followed in the footsteps of his father, and being without his talents or his arts, he was deposed by Augustus in the tenth year of his reign, in consequence of repeated complaints from his subjects, and banished to Vienne in Gaul. The part of Palestine which had been under Archelaus was now reduced into the form of a Roman province, being placed under the superintendence of a Roman governor, subordinate to the prefect of Syria. No fewer than three of these subordinate governors were appointed in succession towards the close of the reign of Augustus. During the reign of Tiberius there were only two, Valerius Gratus, A. D. 16, and Pontius Pilate, A. D. 27. Pilate seems to have been the first who took up his residence at Jerusalem, those who preceded him having dwelt at Cæsarea. The condition of the Jews under the Roman governors was miserable in the extreme. The extortions of the publicans, whose office it was to collect the revenue, were excessive; and the whole of their proceeding was vexatious and oppressive. It was vain to hope for redress from the governors, whose avarice and injustice were proverbially great. The very fact of paying tribute to a heathen government was felt to be an intolerable grievance. And the Roman soldiers quartered over the whole country, though they prevented a general insurrection, yet, by their very presence, and by the ensigns of their authority, exasperated the minds of the Jewish people, and led to many tumults, and seditions, and murders. A numerous party existed in Judea, whose religious prejudices were opposed to the idea of paying taxes to a foreign power, and who cherished the vain hope of restoring the Jewish kingdom. Attempts were made by different individuals, and particularly by Judas the Gaulonite, to instigate the Jews to a general revolt, which were repressed as they arose. But the fanatical principles were widely spread, and led to excesses, to which, in no small degree, may be ascribed the final destruction of Jerusalem. The party was distinguished by the name of Zealots.

The removal of Archelaus was not connected with any act on the part of the Romans towards his brothers. Trachonitis continued under Philip till the time of his death, when it was annexed to the province of Syria. Herod Antipas continued tetrarch of Galilee till after the accession of Caligula, who, upon the discovery that he had entertained treasonous designs, deprived him of his tetrarchate, and banished him to Lyons, in Gaul.

The period at which we are now arrived is by far the most important in the Jewish annals, or rather in the annals of the world. A short time before the death of Herod the Great, Jesus Christ, the promised Messias, was born at Bethlehem, one of the cities of Benjamin. He commenced his public ministry about the 30th year of his age, and was put to death by the sentence of the Roman governor, Pontius Pilate. The circumstances connected with his life and death and resurrection belong to Christian rather than to Jewish history.

Agrippa, a grandson of Herod the Great, having ingratiated himself with the Emperor Caligula, was appointed tetrarch of Trachonitis, upon the death of his uncle Philip; and upon the banishment of Herod Antipas, the tetrarchy of Galilee was added to the dominion of Herod, and ultimately he was named king of the whole territory that had belonged to his grandfather. This prince, upon his death, left a son, also named Agrippa. He was represented to Claudius as too young to be appointed to such a kingdom, and Palestine was again placed under a Roman governor. A considerable extent of territory, however, was ultimately given to young Agrippa; but Judea and Samaria were reserved as a Roman province.

The policy of the Romans led them to give toleration to their subject provinces in all matters connected with their national worship; and, from Pompey to Tiberius, countenance was given to the celebration of the Mosaic ritual. It was otherwise with Caligula, under whose reign was laid the foundation of those dissensions between the Jews and Romans which led to the utter destruction of the Jewish polity. The insane vanity of Caligula prompted him to enforce divine honours from all his subjects, which threatened the worst consequences to the Jewish people in every part of the empire. The Jews of Alexandria were the first who suffered. By their refusal to comply with the imperial edict, a pretext was afforded to the Grecian party in the city to commence a prosecution against them. The miserable Jews resolved upon sending a deputation to Rome to implore the clemency of the emperor. This deputation was headed by Philo, the greatest of all the uninspired Jewish writers, who has left an account of his interview with Caligula, and of the uncertain respite which was granted to his fellow-citizens. The governor of Syria received orders to place the statue of the emperor in the temple of Jerusalem; but he was induced, by the spirit of calm but determined resistance threatened by the whole nation, to delay the execution of the order till he received farther instructions from the emperor. There is a difference in the account of the manner in which Caligula acted upon this occasion, by Philo and Josephus; it is certain, however, that the Jewish nation remained in a state of suspense and fear till the death of the tyrant.

The worst evils, however, endured by the Jews at this period were not directly from the emperors themselves, but from their provincial governors, who, without exception, seem to have been men insensible to the claims of justice, and actuated solely by a spirit of violence and rapacity. Gessius Florus is represented by Josephus as spoiling whole cities, and ruining entire bodies of men; as giving security to robbers and lawless men when made a sharer in their depredations; and finally, as aggravating the oppressions of the people, to instigate them to open rebellion, that he might escape the danger of a representation of his crimes being made to the emperor. It was natural for the Jewish historian to represent the revolt which terminated in the destruction of his country, as originating in the injustice of their enemies; and it must be allowed, when we contemplate the proceedings of the Romans, that if ever there was a case in which revolt was justifiable, it was in that of the Jews. It may be doubted, however, whether they can be looked upon with that generous sympathy which is always awakened by the history of a people nobly uniting in the assertion of their rights and liberties. Judea, at this period, was torn by factions, a spirit of insubordination and fanaticism, chiefly connected with views of their promised Messias, pervaded the great body of the people; and miserable as was their condition under the oppressions of the procurators, it is impossible not to perceive, in perusing the works of their own historian, that their greatest sufferings were occasioned by the unsettled and violent spirit that reigned among themselves.

The commencement of the war was connected with circumstances which took place in Cæsarea. The Syrian party in that city had been favoured by the Roman emperor, and they abused the advantage which this circumstance gave them, in provoking and harassing the Jews, till at last there was a violent collision, and the Jews were driven out of the city. The leading men among them appealed to Florus, who, instead of affording them redress, cast them into prison. The news of this indignity kindled a flame in the Jewish capital; and the excitement among the people was such as to give Florus the pretext which he had long desired, of letting loose the soldiery upon the citizens. Great cruelties were inflicted, and no distinction was made between the innocent and the guilty. The influence of Berenice, sister of Agrippa, who was in Jerusalem at the time, and the arrival of Agrippa himself from Egypt soon after, promised to restore tranquillity. They both seem to have been sincere in their efforts towards a pacification, and for a time happy results followed the soothing counsels of Agrippa. It was, however, but for a time. All over Judea there were spirits determined not to allow so favourable a pretext for war as had been afforded by Florus, to pass away; and Agrippa, soon seeing that his attempts at mediation were to be in vain, withdrew to his own kingdom, and left Jerusalem to its fate. This was in the year 66. Hitherto the people professed that it was against Florus, and not against the Romans, that they had taken up arms. The distinction would not probably have been acknowledged at Rome, and the Jews did not allow the question to be tried. Eleazar, the son of Ananias the high priest, persuaded the people to reject the offerings which were made by the emperor to the temple, and which had been received since the time of Julius Cæsar; and about the same time the fortress of Massada, near the Dead Sea, was taken, and the Roman garrison put to the sword. Allegiance to the Romans was now in effect renounced, and from this period we may date the commencement of the war.

Eleazar took possession of Aera and the temple; and receiving numerous reinforcements of Zealots or Siccarii from different parts of the country, he not only resisted the assaults of the Romans and of the soldiers of Agrippa, but soon sallied out and made himself master of the whole city. He granted a safe passage to the Jewish soldiers who were against him, and to the troops of Agrippa; but a different fate awaited the Roman garrison. They had capitulated on condition that their lives were to be spared. But the moment they yielded up their arms, the followers of Eleazar commenced an attack, and, with the exception of their leader, they were all put to the sword. This monstrous breach of treaty was on a Sabbath day; and the minds of all those who had not as yet joined in the revolt were filled with gloomy forebodings of the evils which were now inevitable. But the Jews were not the only guilty parties in the deeds which darken the annals of these dreadful times. On the same day of the massacre of the Roman garrison, the Jewish inhabitants of Cæsarea, amounting to 20,000, were put to the sword. Upon this the fire spread at once over all Judea, and an attack was simultaneously made upon the neighbouring territory of Syria. Cestius Gallus, the prefect of Syria, took immediate measures for chastising this presumption. He ordered the twelfth legion into Galilee, and soon afterwards he himself entered Judea with an army of about 10,000 men. He advanced without opposition to Jerusalem, and, from the state of parties in the city, there seems little doubt, that if he had shown common prudence, or common bravery, it would soon have been in his power. But a severer doom was in reserve for it. Cestius, to the surprise of all, in a few days raised the siege, withdrew his troops, and commenced a retreat, which the pursuit of the Jews soon changed into a general flight, in the course of which he lost more than half his army. The Jews only lost a few men.

The news of this defeat was received by Nero with such alarm, that he immediately appointed Vespasian, who was considered as the most experienced general in the empire, to quell the insurrection. Without the loss of an hour after his appointment, Vespasian despatched his son Titus to Alexandria, whence, with the sixth and tenth legions, he was to proceed to Judea. Vespasian himself advanced to Syria.

Upon the retreat of Cestius, many Jews departed from Judea, as from a foundering bark, that was soon to go down in darkness and death. The Christians, we are informed by Eusebius, about this time, also remembering the prophecies of our Lord, retired to the town of Pella to avoid the approaching calamities.

The Jews who remained in their own land were diligent in putting all their strong places in a state of defence.

Vespasian opened his first campaign in Galilee in the spring of 67. His army consisted of about 60,000 men, horse and foot, including auxiliaries. On the first assault he took and burned Gadara. He then presented himself before Jotapata, which was commanded by Josephus, who afterwards wrote the history of the war. After a siege of forty days, the town was taken and destroyed. Above 40,000 men were killed during this siege. Josephus surrendered at discretion, and continued during the remainder of the war a prisoner at large among the Romans. In his history, accordingly, of this miserable period, we have the account of an eye-witness. The fact that the capture of Jotapata was the chief event of the first season, proves that the Roman had met no unworthy foe.

In the spring of the following year, Vespasian commenced by reducing the whole of Peræa, it not being his policy to march directly upon Jerusalem. He then advanced from Cæsarea towards the south, laid waste Judea and Idumea, secured Samaria, and then drew back to Cæsarea, to be in readiness to march with all his forces against the capital itself.

Vespasian had now made all his preparations; he had occupied two seasons in clearing the whole territory round and round, that nothing might interpose to break his onset; Jerusalem itself stood like an isolated tower, against which all the engines of destruction were arrayed; the force of Rome was drawn back to Cæsarea, that it might be sent off with an irresistible shock; but at that critical moment the moving power of this machinery of desolation took another direction, and a period was given to the Jewish people to repent,—or to fill up the measure of their iniquities. Upon arriving at Cæsarea, Vespasian received intelligence which fixed his whole attention upon Rome. Nero was dead, and the fate of the empire was in balance. A more important prize than Jerusalem was now presented to his view, and, called to the purple by the voice of his soldiers, he set sail for Italy, leaving his son Titus to conclude the war.

Throughout the protracted period during which Vespasian had been devastating Judea, Jerusalem, instead of making preparations to withstand the approaching attack, was the scene of contentions so ferocious, that the advance of the Romans was longed for by the great proportion of the inhabitants, as the only earthly means for their deliverance from the terrible evils under which they were suffering. There were three factions within the walls, animated against each other with sentiments of the deadliest hate, and often engaging in actual conflict. Eleazar had seized the temple, and kept himself in strength there with 2400 men. John, the rival of Josephus, had his position in the inner court of the temple. He had a party of 6000. Simon, the son of Gioras, called Simon the assassin, occupied the upper city. His force was the largest, consisting of 10,000, and 5000 Idumeans. Such was the position of the three factions when Titus took the command, and the miseries of the siege itself scarcely exceeded what had been endured amidst the daily encounters of the Jewish soldiery. Death was become so common a spectacle, that it was viewed without emotion. The feelings of kindred were dried up; a callousness of heart seized upon all; the interest in life itself seemed to be extinguished.

At last, about the beginning of April of the year 70, the tide of war took the direction of Jerusalem; and Titus, with the Roman host, advanced from Cæsarea through Samaria, and encamped under the walls. The contending chiefs, when it was too late, entered into negociations for uniting their forces against the Romans. Their mutual hatred, however, was never laid aside, nor did they repose confidence in each other, though they fought with the valour of desperation against the common enemy.

The city was fortified by three walls of prodigious strength. The one built by Agrippa was seventeen and a half feet broad, the stones thirty-five feet long, and so compacted as not to be easily shaken by the battering rams. The walls were everywhere guarded by towers, at intervals of about 350 feet, of solid masonry, and of great height. The tower Psephina, opposite to which Titus encamped, was 122 feet high; it is said to have commanded a view of the whole territory of Judea to the border of Arabia and to the Red Sea; and there were other towers of scarcely less imposing appearance, and of equal strength. Above the whole city stood the temple, the walls of which were in no place lower than 500 feet. It covered a square of a furlong each side, and was of such strength as to be supposed impregnable. Some of the stones employed in the work were seventy feet square;—and not one of these was to be left upon another.

At first the Jews made some sallies, so vigorous as to astonish the Romans themselves. Had the parties within been united, and had the time from the commencement of the war been employed in putting the city in a state of complete defence, it might have withstood the whole Roman power for years. But the day and the hour of its overthrow had been fixed in the counsels of heaven.

After strenuous fighting for every inch of ground, two walls were successively abandoned by the Jews. But the heights of Zion, the Antonia, and the temple, still remained, which might be considered the strength of Jerusalem; and so hopeless did every attempt seem to take any of them by storm, and so paralysing were the desperate efforts of the Jews upon the Roman power, that Titus found it necessary to blockade and starve the city and garrison. The inhabitants of Jerusalem now saw their enemies "*casting a trench round about them, and compassing them round and keeping them in on every side.*" The wall, which was nearly five miles in circumference, was completed in three days. The horrors that ensued are beyond description. Even before this time the evils of famine had begun to be experienced. In the extremities of hunger, many ventured out of the city to gather herbs. Strict orders were given by Titus that such individuals should be seized upon, and an example made of them, to the terror of the besieged. Those who were found with arms were crucified, sometimes to the number of 500 in a day; and the soldiers used to expose them in mockery to those upon the walls, nailed in different postures. At last wood was awanting to place the bodies upon, and room on which to erect the crosses. When the wall was completed, there was no longer the possibility, at any risk, of finding sustenance from without, and the ravages of hunger became inconceivably great. Whole families perished. Houses were filled with dead women and children, the streets with aged men. The young had not strength to bury the dead. Many died in the attempt to give burial to others, and many repaired to the tombs to wait for death. There were no more tears seen, nor cries heard. They sat with dry eyes, and mouths drawn up into a bitter smile. A deep silence was spread over the city, forming a horrible kind of night. The only noise was from those who were engaged in the work of plunder, whose mirth it was to try their swords upon the bodies of the dead; but if any one begged them to put an end to their misery, they would not kill them. The dying turned their eyes to the temple, as if to complain to God that these wicked men were suffered to live. Everything was eaten; their girdles, the straps of their sandals, the remains of old hay, the refuse of the dunghill. Scenes still more horrible discovered the depth of dreadful meaning in the words of our Saviour: "*Behold the days are coming in which they shall say, blessed are the barren, and the wombs that never bare, and the paps that never gave suck.*" And the predictions of Moses were fulfilled even to the letter: "*The tender and delicate, which would not adventure to set the sole of her foot upon the ground for delicateness and tenderness, her eye shall be evil towards her husband, and towards her son, and towards her daughter, and towards her young one that cometh out from between her feet, and towards the children that she shall bear; for she shall eat them for want of all things secretly in the siege, and straitness wherewith thine enemy shall distress thee within thy gates.*"

The cup was now full, and "for the elect's sake the days were shortened." The fortress of Antonia, after many furious assaults, was taken and destroyed; and, on the 17th of July, Titus advanced as far as the temple, where the perpetual sacrifice ceased for want of a sufficient number to offer it. Still the Jews refused to surrender, and the works of the Romans proceeded. On the 8th of August, Titus attacked the second court of the temple. The walls could not be beat down, from the size of the stones, and the defence of the Jews prevented the scaling of the galleries. Fire was therefore set to the doors, which soon spread into the temple itself, and reduced the splendid edifice into a heap of ruins. Still the upper city held out. But at last a breach was effected, and on the 8th September the whole of Jerusalem was in the hands of the Romans, and orders were given by Titus for demolishing the city and temple.

Three forts in Judea still held out against the Romans, Herodion, Massada, and Machaeras. Two of these made a long and vigorous defence, but before the end of the year 72 Judea was in a state of entire subjugation. Contrary to the usual policy of the Romans, the territory was not shared among military colonists. All the lands were exposed to sale. In the northren districts the chief purchasers were Syrians. Individuals among the Jews themselves bought considerable properties in the south; the proceeds were reserved for the imperial treasury; and a capitation tax was imposed upon the Jewish people throughout the empire, and exacted with the most galling severity, for restoring and adorning the Roman capitol, which had been destroyed in the civil wars some time before the fall of Jerusalem.

From the time of the destruction of Jerusalem by Titus, there is no longer any connecting tie in the history of the Jewish people, except their imperishable love to the religion of their fathers. Scattered abroad in almost every country of the world, in every variety of outward condition, their fate presents matter for a subordinate chapter in the history of other nations, rather than a separate subject of history. We are presented with a mass of materials, to which the ordinary rules of historical arrangement, by epochs and by countries, do not apply. The condition of the Jews from this date varies in different kingdoms, and even in different parts of the same kingdom at the same period, and is so intimately connected with the varieties of national policy, and with local and temporary causes, that it cannot perhaps be fully understood in all its parts, except when viewed as incorporated with universal history. There are, however, a few general heads, under which the more important particulars connected with their destiny may be classed; the classification must indeed be imperfect, from the discordant and impracticable nature of the materials with which we are presented; still, however, there is one principle which gives a unity to them all. And in the absence of the definite lines which limit historical narrative in other instances, we must be more forcibly struck with the peculiarities of this singular race, among whom the want of a native country has formed a bond of connection more powerful than all the ties of country to other tribes; while the efforts made to sever them from their religion has made them cling to it with an energy that seems to have incorporated itself with the very essence of their being. The circumstances which preserved the Jews as a separate people after the termination of the temple worship, were similar to those which operated during the time of the captivity, with the addition of the rabbinical system, which was now in full operation. In whatever country a few families of Jews were collected into one place, the worship of the synagogue brought them into religious fellowship; and pride in their privileges as God's peculiar people, a principle of honour in not deserting a persecuted cause, revenge against a world from which they received so much injustice, combined with never-abandoned hopes of blessings yet in store for themselves or their children, and the magic influence of associations connected with their ancient ritual, have perpetuated the Jewish name in every country where cupidity has allured or cruelty banished any of the members of the race.

There is little that is interesting in the history of the Jews for near forty years after the destruction of their city. The ruins of Jerusalem were occupied by a Roman garrison, to prevent any attempt to rebuild it; and the tax imposed by Vespasian continued to be exacted by his immediate successors, who exhibited considerable jealousy of the Jews, and often subjected individuals among them to great hardships and indignities. Upon the whole, however, the race seems to have enjoyed considerable security; and though forbidden to approach Jerusalem, large communities were suffered to be formed in Palestine.

In the beginning of the reign of Trajan, a spirit of restlessness and sedition again began to appear among this unhappy people in all quarters of the world. When the emperor was engaged in the war with Parthia, the hereditary enmity of the Jews and Greeks in Egypt broke out in hostilities, in which were shed oceans of blood. No effective attempt seems to have been made for some time on the part of the Romans to put an end to these commotions. At last, however, Hadrian interposed, and inflicted on the miserable Jews signal punishment. About the same period, A. D. 116, the Jews of Mesopotamia, whom the victories of Trajan had subjected to the Roman instead of the Parthian sway, rose in unsuccessful rebellion against their new masters. In the following year Trajan died, and, under his successor Hadrian, the Mesopotamian Jews were again left to the sway of their ancient monarchs.

The accession of Hadrian was not likely to prove advantageous to the Jews in general, as it had accidentally been to those of Mesopotamia. He had indicated his sentiments towards them by his proceedings in Cyprus and Egypt before the death of Trajan; and when he succeeded to that prince, he issued an edict forbidding circumcision, the reading of the law, and the observance of the Sabbath; and he announced his purpose of establishing a Roman colony on the ruins of Jerusalem, and of erecting a temple to Jupiter on the place where the temple of Jehovah had stood. To this new city was to be given the name Ælia Capitolina, from his own prænomen, and from the dedication of the capital to Jupiter. For a time the Jews submitted, with ill-concealed purpose of resistance, to the authority of Hadrian. But in the year 129 we find the whole of Judea once more in a state of rebellion. The leader of this new revolt was Barchochab, which, in the Syriac, signifies the son of the star. He assumed the character of the Messias, pretending that he was the Star of Jacob foretold by Balaam, who was to deliver the Jews and subdue the Gentiles. Little is known of his previous history. According to report, he had been at one time a robber; and his conduct shows that he must have been a man thoroughly conversant with scenes of blood and rapine; while the devotedness of his followers, and the vigorous and for a time successful resistance he made to the Romans, evince him a man of talent and energy. The war against Barchochab presents a repetition of the scenes of that of Titus. Success at last declared wholly in favour of the Romans, and, about the year 134, Judea was again made desolate. About a half million fell by the sword in the course of this war, besides those who perished by fire, famine, and sickness. Those who escaped were reduced to slavery by thousands. Such as could not be thus disposed of were transported into Egypt, and Palestine was almost wholly depopulated. The Jews were now forbidden to enter Jerusalem, or even to look upon it from a distance; and the city, under the name of Ælia, was inhabited by Gentiles only, or such Christians as renounced the Jewish ceremonies.

However severe the Romans might be in the wars which they carried on against the Jews, they seem to have been ready to lay aside their resentment when the occasion passed away; and under Antoninus Pius we find the Jewish people again restored to their ancient privileges, with a prohibition merely against proselytizing. They were still excluded from Jerusalem, but they were permitted to form and to maintain considerable establishments both in Italy and in the provinces; and while they were exempted from many expensive and burdensome offices, they enjoyed municipal honours in common with other citizens. The erection of new synagogues was permitted in the principal cities; and the Jews were allowed to celebrate the solemnities of their religion without molestation.

At this period we find the eastern and western Jews divided under two great spiritual monarchies, viz. the patriarchates of Tiberias and Babylon. The origin of both is involved in considerable obscurity. In regard to the former, viz. that of Tiberias, the tradition among the Jews themselves is, that the Sanhedrim, after moving from Jerusalem, settled at Jamnia, and finally fixed their abode upon the banks of the Lake Genesareth, where their supremacy was acknowledged as of divine appointment, their chief or president exercising the authority of a spiritual head over the Jews in the provinces of the Roman empire. He was acknowledged as their patriarch or pontiff. An annual contribution was raised for him by the dispersed brethren, and his legates or apostles visited every synagogue, bearing his mandates, and deciding in all questions that were brought before them. To this new form of government a legal sanction was given by the Roman emperors, and it continued in existence till about the beginning of the fifth century. As the law was still made to extend to every moment of time, and to every variety of thought and action, with a burthensome and perplexing minuteness, and no memory could retain the multitude of statutes which were prescribed, and difficulties were constantly arising as to the duty required in new combinations of circumstances, the Jewish lawyers continued to possess an unbounded power over the consciences of the people. And as it was indispensable that all the rabbis should agree in their decisions, reference was constantly necessary to the spiritual patriarch, so long as the traditionary law was not committed to writing, and was to be found only in the living decision of the patriarch and his senate. The publication of the Talmud, though it exalted the character of the special patriarchs by whom the work was undertaken, was calculated to diminish the influence of the patriarchate. It took away the necessity of appeal from the inferior courts, by affording the means to every rabbi to give a just decision. This must be considered as the chief cause of the fall of the patriarchate of Tiberias, which took place about the beginning of the fifth century; though other circumstances contributed. The exportation of the annual tribute from Rome was prohibited by the Emperor Honorius; by a law of Theodosius the title of prophet was taken from the patriarch Gamaliel; and upon the death of that individual, though the office was not abolished, its authority being destroyed, no successor was found, and the power which had been exercised by the patriarchs passed into the hands of the rabbinical aristocracy.

The power of the patriarch of the West was of a spiritual nature; but in the East, the office corresponding to the patriarchate involved a mixture of temporal authority. The Babylonian Jews are those inhabiting between the Tigris and the Euphrates. During the wars between the Jews and Hadrian, this colony was greatly increased by fugitives from the West. In their early history, and till a considerable time after the introduction of rabbinism, the Babylonian Jews were less distinguished from the people among whom they lived than their brethren in the West. So long as the temple remained, it formed a bond of union between the two classes, as they all contributed regularly to its support. In addition to this religious tax, they paid another to the kingdom to which they belonged. A system of taxation was organized for this latter purpose, which was intrusted to a chief person among themselves, named the Resch Glutha, that is, a chief of the colonists, or, as he is usually called, Prince of the Captivity. The office of this individual was at first wholly of a temporal nature, and all that related to matters of faith and worship was regulated by the decisions of the Sanhedrim at Jerusalem. After the destruction of Jerusalem an attempt was made to throw off the dependence upon the schools of Palestine, which was frustrated for a time by the arts of the patriarch and his senate. By degrees, however, the inconvenience of a constant reference to a distant country, and the growing celebrity of the schools of Nisibis and Nahardea, enabled the Resch Glutha to establish his independence. He formed a court after the model of that at Tiberias; and, under the prevailing belief that he was the lineal descendant of David, he succeeded in establishing his claim to a spiritual, in addition to his temporal authority. He exercised a power almost despotic over the Jewish people; and, though a vassal of the king of Persia, he maintained an almost regal state. The rabbis were in complete subjection to him; and from his being able to bring his power as a temporal prince to bear upon his ecclesiastical mandates, his influence over the Jewish community was greater than that of the Nasi. From our ignorance of the state of the East beyond Persia, the extent of his dominions cannot be ascertained. His subjects consisted of shepherds, husbandmen, artisans, and merchants; of the latter many were wealthy. They do not seem to have been subjected to persecution, and, in the enjoyment of peace, the interests of learning flourished. Schools rose rapidly in different parts of his dominions; and to one of these we are indebted for the Talmud of Jerusalem, which has exercised such an influence upon the Jewish people in all succeeding times. The increasing number of the schools, and of the learned men proceeding from them, gradually lessened the influence of the Resch Glutha, though the office continued in existence till the middle of the eleventh century, when it was suppressed by the tyranny of one of the caliphs.

The establishment of Christianity as the religion of the Roman empire, the irruption of the northern nations, and the rise and progress of Mahommedanism, had all a marked influence upon the condition of the Jews. The first Christian emperors conducted themselves towards the Jewish people with a lenity and forbearance that was not always agreeable to some of their subjects. Under Constantine the right of the Jews to the privileges of Roman citizenship was fully recognised, while the rabbis had the same exemption from civil and military offices as the Christian clergy. Christians, however, were prohibited from becoming Jews, while converts from Judaism were protected from the resentment of their countrymen. Under Constantius the Jews of Palestine subjected themselves to the severity of the laws by their interference in the contests between the Arians and Athanasians. Several of their cities were destroyed, and the law of Hadrian was renewed, by which they were forbidden to approach Jerusalem. The hatred of Julian to the Christians disposed him to view their enemies the Jews with a favourable eye. He entered into a correspondence with the patriarch of Tiberias, and wrote a friendly letter to the Jewish community, in which he promised to put them again in possession of Jerusalem, and to restore their temple. At last an edict was issued for the rebuilding of the sacred structure, and instructions were given to Alypius, prefect of Syria, to carry it into effect. Jerusalem was once more filled with Jews, who assembled from all sides, emulous to give their aid in an undertaking which was to prove a new era in their history. Materials for the vast fabric were collected, and the mountain was purified from the abominations of idolatry. But when the workmen proceeded to dig for a foundation, they were surprised by a subterraneous explosion, in which some perished, while the rest took to flight in dismay. Though a difference of opinion has existed as to the character of the igneous irruption, the evidence that the work was in fact suspended is of the strongest nature, and the truth of the predictions of Scripture was fully maintained. The death of Julian prevented the renewal of the attempt, and put an end to all his schemes for the benefit of the Jewish community. His successors showed in general a tendency to favour the Jews as useful subjects, and frequently protected them from the violence of the people, though in some instances the bigotry of the more powerful prelates prompted to measures of severity. It must be added, that the blind zeal of the Jews often rendered them the just objects of the popular indignation.

Upon the division of the Roman world, the condition of the Jews in the eastern empire became less favourable than that of their brethren in the West. For a time, indeed, they continued to enjoy the rights of Roman citizens according to the law; but under Justin I. they were pronounced as belonging to the same class with heretics, and consequently disqualified for civil and military offices. The laws of Justinian were framed for persecuting them into proselytism. By the imperial edicts the duties of citizens without the honours were rigorously exacted. In mixed marriages, the education of the children was confined to the Christian parent: if the children grew up unbelievers, they were deprived of their inheritance; and in law-suits, except in cases where both parties were Jews, their testimony was inadmissible. Another law was passed by this emperor, in consequence of a division among the Jews themselves, which, had it been observed, might have been followed with serious consequences to Judaism. Upon the suppression of the patriarchate, the power which had been enjoyed by that spiritual chief was divided among the primates or chief rabbis of the separate Jewish communities. The power of the rabbis arose principally from the respect in which the Talmud was held, and from the right which they enjoyed of expounding the sacred volume. From policy or habit their instructions were conveyed in ancient Chaldaic; and as this ceased to be understood by many of their hearers, who adopted the language of the country in which they settled, a very general wish prevailed for a change in this custom, and for a translation of their Scriptures. This alarming spirit of innovation was resisted by the rabbis; and the contending parties resorted to the extraordinary expedient of referring the cause to the Christian emperor. The decision of the emperor was in favour of the rights of the people. In the edict which was issued, the fullest license was granted for reading the Scriptures in the vernacular tongue; the Mischna was declared to be of human composition merely, and full of such errors as belong to all the works of men; and the hope of the emperor was expressed that the perusal of the Scriptures in a known language might lead to the conversion of many to the Christian faith. It is probable that this intimation awakened the suspicions of the people, who do not appear to have availed themselves of the permission that was given them.

In the western empire, upon the irruption of the barbarous tribes, the Jews suffered less than their Christian neighbours. Ready to accommodate themselves to every change of circumstances in the pursuit of gain, we find them following in the rear of conquering armies, or retreating before advancing hosts, contriving in one form or other to make their harvest of traffic in both cases, and frequently growing rich amidst the general ruin. In all the kingdoms which rose up out of the ruins of ancient Rome, the Jewish people formed a part; but our information respecting them for a considerable period is far from being complete. In the absence of a literature of their own, we know of them only by ecclesiastical writers, who take notice of them chiefly as the objects of the converting zeal of the catholic church. The success of the Christian priesthood among their barbarous invaders inspired them with hopes of gaining converts among the Jews. But the circumstances of the two classes were altogether different. Among the heathen, when a prince or a successful warrior was converted to the faith, he carried along with him all his subjects, or his companions in war. But the Jews moved in masses only in matters connected with their own religion; in every other respect they were wholly independent of each other. Their conversion, therefore, could only be the effect of conviction on the part of each individual. The character of the Christian clergy did not fit them for so arduous an undertaking. Their ignorance and frequent immorality placed them at a disadvantage in regard to the Jews, who were in possession of the Old Testament Scriptures, and had arguments at command which their opponents could not answer. Besides, there were no inducements of a worldly nature at this period to influence the Jews to exchange their religion. They had no wish for the retreat of the cloister, nor did they stand in need of protection for deeds of violence and rapine. Their habits were of a description altogether different from those of the monk or brigand. The attempts of the clergy, however, were unremitted, and threats and blandishments were alternately resorted to, and the struggle was constant between Catholicism and Judaism. In the political contests between the Arians and the Catholics, the Jews, as they had done in Asia, took advantage of the divisions, naturally ranging themselves on the side of the Arians, and they found their advantage in this alliance. The Gothic tribes, however, were soon brought over to the orthodox belief, when the Jews stood opposed to the united body of Christians, till the appearance of a new religion wrought a diversion in their favour.

The rise and progress of Mahommedanism proved, upon the whole, highly advantageous to the Jewish people. Equally descendants of Abraham with the followers of the prophet, they had in so far a common cause against idolators, and against the defendants of the Christian doctrine; and this for a time made them forget the points of difference. In the new impulse given to trade by the progress of the Moslem arms, the Jews, ever awake to their own interests, took their advantage. In the wide extent of conquest, new wants were created by the advance of victorious armies, kingdoms which had long ceased to hold intercourse with each other were brought into union, and new channels of commercial intercourse were opened up; and, leaving the pursuits of agriculture, which were placed at a disadvantage by the policy of the caliphs, the Jews became the merchants by whom the business between the eastern and western world was conducted. In the court of the caliphs they were favourably received; and for centuries the whole management of the coinage was intrusted to them, from the superior accuracy and elegance with which they could execute it, and from their opportunities, by the extent and variety of their commercial relations, to give it the widest circulation, and at the same time to draw in the previous issues of other mints. Nor did they flourish only in commercial greatness. Not a few of them distinguished themselves in the walks of science and literature. They became eminent in astronomy, astrology, medicine; the principal translations by which the Arabians became acquainted with the discoveries and theories of Grecian and Roman authors were conducted by them, though their chief attention was directed to the Talmud, and to the literature connected with it.

Wherever the Moslem arms extended, we see the Jews for a time in a prosperous condition, though with various exceptions, in different countries and under different caliphs. In North Africa, in Egypt, in Persia, we find Judaism in a more favourable state than formerly; and in Spain, the Jews rose to a height almost as great as that of the Moors themselves. In that country their religion enjoyed full toleration, and the Arabico-Jewish literature forms an important chapter in the history of learning from the seventh till the twelfth century.

There is a tradition, that during this period a Jewish kingdom was established on the shores of the Caspian, named Khazar. The inhabitants of the territory consisted indiscriminately of Jews, Christians, and Moslemites, drawn to the spot by the advantages which the situation of the country presented for trade. A king of the country (740) was converted to the Jewish faith, and for some time the affairs of the nation were conducted by a Jewish prince, with the assistance of a council, whose members were of different religious persuasions. A period of only a century and a half is fixed for the succession of Jewish princes, though at a later date a considerable part of the population consisted of Jews.

About the same period a combination of circumstances proved favourable to the condition of the Jews throughout Christendom. Charlemagne protected their interests. He is said to have had a Jewish merchant always near his person, and the correspondence between that great monarch and Haroun Alraschid was under the care of a Jew.

 The immediate successors of Charlemagne followed the same line of policy. France numbered the sons of Abraham as the richest of her merchants. Their fame as physicians was also widely spread; and their intelligence and activity commended some of them to high political offices.

But a time of change was approaching; and we have now to trace a gradual decline in the Jewish character and condition, till at last we find that unhappy people trampled upon, crushed, butchered, proscribed, in almost every country in Europe. The special causes of the persecutions to which the Jews were subjected were different in different countries, and it would far exceed our limits to trace them minutely. Throughout the greater part of Europe, however, we witness the advances of a similar process. We find the Jews abhorred by the superstitious on account of their religion, envied by the powerful on account of their riches; and, amidst the contempt and injustice to which they were subjected, courting, if not meriting their fate, by crouching before and cozening their hated oppressors. In many parts of Europe they were not allowed to possess land, and were forbidden to aspire to offices of trust or honour. The injurious effects of this exclusion were soon manifest in their character and habits. Shut out from all the paths which lead to distinction, the aspiring aims of honourable ambition, and the ennobling feelings connected with the love of country became strangers to their bosoms. Their efforts were limited to the accumulation of wealth; and in the decay of commerce during the middle ages, their minds were debased by the petty details of the lower species of traffic, which was all that was now open to them. Their ambition being thus fixed upon one subject, they soon mastered all the degrading arts of accumulating gain; and, prohibited from investing their gains in the purchase of land, they found a more profitable employment of it in lending it at usurious interest to the thoughtless and extravagant. The effect of this was inevitable. At a time when commercial pursuits were held in contempt, the assistance of the Jews became indispensable to the nobles, whose hatred rose in proportion to their obligations; and, where there was the power, the temptation to cancel the debt by violence became often irresistible. The Jews had no means of resisting such injustice, and their only revenge was in the exaction of more exorbitant terms when the necessitous again had recourse to them. The meanness and injustice of which they were thus unquestionably guilty inflamed the public feeling against them, till every atrocity was considered as justifiable when directed against a Jew.

In the Germanic empire the rights which the Jews had enjoyed under the ancient Roman law were to a certain extent continued to them; and though they gradually became the objects of aversion to all classes, the imperial protection and the papal ordinances preserved them from general attack till the time of the Crusades. It was at Trêves that the suggestion was first made to the fanatical multitude proceeding under Peter the Pennyless to take possession of the Holy Land, that they should fall upon the enemies of the cross living among themselves. The choice of death or of conversion was given to the miserable Jews of that city, and only a few escaped alive from the general massacre. Fathers presented their breast to the sword after putting their own children to death, that they might be rescued from the danger of being trained up as Christians; and wives and virgins sought for refuge from the brutality of the soldiers by throwing themselves into the river with stones fastened to their bodies (1096). Similar scenes were repeated in Cologne, Mentz, Worms, and in all the cities on the Rhine; and the progress of the armies was marked by the blood of the Jews till they reached the plains of Hungary. Upon a moderate computation, not fewer than 17,000 are supposed to have perished. The minds of those who escaped were filled with consternation; and their synagogues resounded with their appeals to the justice and mercy of the God of their fathers, who seemed to have forsaken them who refused to forsake Him. Many fled to Silesia, Moravia, and Poland, where they laid the foundations of great communities. A few, however, still continued to cling to the land that had given them birth; and we find them again in sufficient numbers to excite the persecuting zeal of the second Crusaders (1146). Upon this occasion the greater part saved themselves by a timely flight. Forty years later, the Emperor Frederick gave his protection to his Jewish subjects till the tempest of the third Crusade swept past. Disastrous as the period of the Crusades was to many of the Jews in Germany, there were some of them who yet contrived to reap a golden harvest. A demand for money was created for the support of so numerous armies. Many chiefs parted with their estates to enable them to proceed with their retainers to the Holy Land; and in the transfer of property which thus took place, as well as in the trade that was occasioned by the fitting out or march of numerous hosts, many Jews accumulated great wealth.

From the time of the Crusades, the condition of the Jews in Germany continued unsettled and degraded. History is full of instances of the injustice which they suffered from the rapacity of princes, and from the tumultuous assaults of the people. From certain states and cities they were interdicted altogether. In others, however, they had a right of residence, and a particular quarter of the city was assigned to them. But the privileges conferred upon them often proved the occasion of new injuries. They were frequently expelled from the streets to which they had a legal right, in order that a sum of money might be extorted from them for permission to return to their own dwellings; the popular fury was ever ready to break out against them; and needy princes held out the threat, that unless their coffers were replenished by contributions from the Jews, an incensed populace would be let loose upon them. Upon other occasions, the necessity of their conversion was insisted upon, and they were compelled to pay large sums to avoid the misery of being forcibly baptized. Reports were continually circulated to their disadvantage. Stories were told of Christian children having been found murdered in the house of a Jew, or of their own children being prevented by cruel threats from adopting the Christian faith, or of their stealing the consecrated host to crucify afresh the Son of God. And such fabrications had the effect of subjecting the Jews to the cruelty of lawless mobs, of circumscribing their rights, and of placing their lives and fortunes at a miserable uncertainty. Enthusiasts arose, who considered themselves commissioned by Heaven to proclaim war against the unhappy people. A nobleman named Rhindfleish, in the thirteenth century, proceeded through many of the most populous towns in Germany, followed by a multitude, who destroyed whole communities. A peasant named Armleder followed a similar course (1337), till his atrocities awakened the tardy justice of the emperor, by whom he was put to death. In 1346, the Flagellants came into a collision with the Jews of Frankfort, which terminated in a battle between the other citizens and their Jewish neighbours. A few years later, the whole of Europe being desolated by a plague, in Germany it was believed that the Jews had thrown poison into the public wells. The result was terrible. At Basle the Jews were brought into a vessel on the Rhine, which was set on fire, their children being spared that they might be educated as Christians. It would be tedious to enumerate the various forms in which the Jews met their death in other cities. But from Switzerland to Silesia the land was drenched with innocent blood, and even the interference of the emperor and the pope proved long insufficient to put an end to the atrocities that were perpetrated.

Feelings of humanity, as well as the interests of his kingdom, led the Emperor Charles IV. to grant to certain states and cities privileges which they had long in vain petitioned for; and in the Golden Bull the condition of the Jews was determined in such a way as preserved them from the hazard of the massacre of whole communities, though it left them still exposed to the evils of individual oppression and injustice.

Though thus subjected to every variety of inhumanity and injustice in the German empire, they were still permitted to remain in the country; and in some states and cities considerable immunities were possessed by them. It was otherwise in France, Spain, and Britain, from which countries, after being subjected to the most galling persecution, they were ultimately driven into banishment. In France the condition of the Jews had always been more precarious than in Germany; and from the tenth century we see them gradually and rapidly declining from a learned, and influential, and powerful class of the community, to miserable outcasts; the common prey of clergy, and nobles, and burghers; and existing in a state worse than slavery itself. Even in this wretched situation, though deprived of every thing else, and denied the common rights of humanity, they were still possessed of gold. This was at once their strength and their weakness; though hated by all, all were dependent upon them; and, possessed of a large proportion of the wealth of the kingdom, they had articles of value in pawn from all classes of the community. They suffered here, as in Germany, by popular violence; and the proceedings of the princes were if possible more arbitrary and tyrannical. The archives of the kingdom, however, contain evidence of usurious extortion so monstrous as loudly to call for legal interference, though not certainly in the way in which it was actually made. The edicts which terminated in their final expulsion from the kingdom began with Philip Augustus. He issued an ordinance for the relief of those who were indebted to the Jews. According to it, all the pledges in their hands were to be restored. Among these a golden crucifix and a Gospel being found, the popular suspicion was awakened, and all the Jews of Paris were sent into banishment. The necessities, or cruelty, or superstition of succeeding kings varied the modes of Jewish persecution. Louis VIII. annulled all interest on debts due to the Jews. Under Louis IX. an edict was promulgated for the destruction of the Talmud. By other laws, Jews were forbidden to hold social intercourse with Christians; and no punishment was to be inflicted upon a Christian who killed a Jew. As in Germany, monstrous tales were spread abroad, and believed, of their sacrilege and cruelty. They were accused of throwing poison into rivers, of practising magic, of holding correspondence with infidel kings. They were proscribed, hunted down, burnt to death. Yet still they sought to live in the land that oppressed them, paid a price to live in it,—and their revenge upon their oppressors was to drain them of their gold. At last, in the latter part of the reign of Charles VI. (1594), they were commanded to quit the kingdom. This sentence was rigidly put into execution; and the greater part of the exiles withdrew to Germany, Italy, and Poland.

The time of the introduction of the Jews into England is unknown. Traces of them are discoverable before the Norman invasion; after which event a considerable addition was made to their numbers. William II. found in his Jewish subjects so great a source of profit, that he refused to allow them to become converts to Christianity. The Jews flourished accordingly under his reign; they increased in numbers and in opulence in various cities throughont the kingdom, and the greater part of Oxford is said to have belonged to them. It is somewhat remarkable, however, that their only burial-place was in London, and it was not till the time of Henry II. that they were allowed the privilege of interring their dead elsewhere. Though favoured for a time by the English monarchs, from the advantages they derived from them, the Jews became the objects of popular hatred, partly from motives of superstition, and partly from the odium that at that time was generally attached to the practice of lending money upon interest, as well as from the rigour with which this practice was exercised by them. The first general display of the public hatred was in the reign of Richard I. On the day of the coronation of this prince, some Jews, contrary to an express prohibition, were discovered as spectators of the ceremony. An attack was made upon these individuals, which terminated in a general assault upon the Jews. Their houses were plundered, and in many instances committed to the flames. Richard in vain attempted to repress the tumult, which continued to rage two days. Similar outrages ensued in Norwich, Stamford, and in several other towns. Knights who were proceeding to the Holy Land considered themselves justified in robbing the rich Jews, to aid them in their pilgrimage. And, in many cases, those who had borrowed money from their Jewish neighbours stirred up the people to a tumultuous onset, as the easiest way of cancelling their debts. In York the Jews took refuge in the castle, and made a vigorous resistance; but finding their situation hopeless, they devoted themselves to a voluntary destruction. They first destroyed everything of value that belonged to them. After this their chief with his own hands murdered his wife and five children, and then submitted to death himself. Their dead bodies were thrown over the ramparts. The example was followed by five hundred others. In the mean time, those who were indebted to the Jews proceeded to the cathedral, where the bonds were kept, and committed them to the flames. During the two following reigns, the history of England abounds in instances of the oppressions to which the Jews were subjected, and of the vast sums extorted from them by the necessities of the monarchs; though privileges were occasionally conceded to them, in such forms as insured a profitable return. The tyrannical proceedings of King John in reference to the unhappy race are well known, and in particular the anecdote of his ordering that a rich Jew of Bristol should lose a tooth daily till he paid 10,000 merks. The Jew lost seven teeth before he yielded. Their situation was in no degree improved under Henry III. Though various decrees were issued in their favour, the superstitions of the clergy and the people, and the necessities of the government, subjected them to every varied form of contumely and wrong. After the king had repeated his extortions so frequently that the Jews made the vain threat of leaving the kingdom, he sold to his brother all the Jews in his realm for 5000 merks, with full power over their persons and property. At last, in the succeeding reign (of Edward I.), an edict was issued (1290), without any known pretext afforded by their conduct, for their expulsion from the country altogether; and, after having been deprived of all their possessions, the wretched race, amidst the mockery and triumph of the common people, proceeded to the shore, and finally left the island. The exiles amounted to 15,000, or, according to others, to upwards of 16,000.

The history of the Jews in the Spanish peninsula forms one of the most interesting and affecting chapters in the strange vicissitudes of that ill-fated race. During many centuries their situation, both in Spain and Portugal, was more favourable than in any other European country. The political influence which they enjoyed with the Moslems commanded for them the respect of the Christians, if it increased their hatred; and after the decay of the Mahommedan power, their superior education, their talents for affairs, their wealth and their industry, in a country where the lower orders were sunk in the deepest degradation, while the nobles were engaged almost wholly in war, rendered them too important a class of the community to allow their rights to be rashly interfered with. The protection which they enjoyed arose in no small degree from the policy of the sovereigns, who found their Jewish subjects invaluable, not only to themselves individually in various departments, as physicians or ministers of finance, but also to the country generally, from the life which their industry gave to trade, and from the unfailing certainty with which recourse might always be had to them upon every occasion when money was required. The nobles, and even the priesthood, were by no means insensible to the latter of these advantages; and when, in some instances, the sovereigns, forgetting their true interests, prepared to make the Jews the subjects of their extortion, we find the clergy overcoming their superstitious feelings, and interfering in their behalf.

The political or rather legal position of the Jews in Spain varied in different periods, and even at the same time in different parts of the country. In the most favourable circumstances, they were considered as belonging to the king directly, and indirectly to his greater vassals; and thus they enjoyed the right of self-defence, and could claim the protection of their liege lords when unjustly attacked. In all their greater communities they had their own courts of law, which enjoyed a certain jurisdiction both in civil and criminal affairs. They could possess landed property, though many efforts were made to restrict this right, which induced them here, as in other countries, to engage in the practice of lending money upon interest. The rate of interest was fixed by the law; and we do not find charges of chicanery and extortion brought against them similar to those made against their countrymen in France, or England, or Germany. Among their other privileges, they could not be imprisoned on account of debt, and, with certain limitations, their evidence was received in courts of justice. In Portugal they enjoyed similar privileges as in Spain.

The superior character of the peninsular Jews proved that these advantages were not unworthily conferred. They held a much higher rank than in the other parts of Christendom. Not compelled to have recourse to arts that sunk them in their own esteem, they maintained a generous rivalry in the liberal use they made of the wealth which they acquired in the walks of honest industry. Their literature betokens no ordinary progress in civilization. Their acquaintance with Arabic put them in possession of all the treasures of that language. Their poets, grammarians, mathematicians, naturalists, are of no mean reputation. And their astronomers were in so great renown, that some of them were employed by Alphonso the Wise in the construction of his celebrated Tables. The study of mental science was also cultivated with no ordinary care, though the pursuits of science, whether natural or metaphysical, were ever more or less connected with their theology. Three epochs have been marked in the progress of the philosophy of the Jews of Spain. In the first, we have the endeavour to connect the discoveries of science with the doctrines contained in the Talmud, and to present the peculiarities of Judaism in a philosophic form. In the second, we find the spirit of rabbinism lording it over the efforts of philosophic genius. In the third, a contest was carried on, sometimes under the forms of philosophy, between the advocates of Judaism, and those who endeavoured by the force of argument to gain converts to the Christian faith.

The point at which the star of the fortunes of the Spanish Jews might be said to culminate, was in the thirteenth century, during the reign of Alphonso X. From that period the superstitions of the people were more bitterly directed against the unfortunate race, and in the succeeding reigns constant attempts were made to diminish their privileges, while local outbreakings of popular dislike subjected individuals and whole communities to severe suffering. Alphonso XI. though himself favourably disposed towards them, was compelled (1325) to yield in various particulars to the feeling that began to be expressed against them. In this reign they were enjoined to confine themselves to particular streets, at the greatest distance from the churches; and thenceforth particular districts were known in every city where a community existed as the Jews' Quarter. The greatest misery, however, to which they were subjected arose from attempts for their conversion. A proselytizing spirit had manifested itself in various forms from an early period. An institution was erected in Aragon in 1250, for the express purpose of training men to enter into controversy with the Jews; but, not trusting to the mere force of argument, the rabbinical writings were frequently subjected to a censorship, by which whatever was supposed to be injurious to the interests or hurtful to the feelings of churchmen was cancelled. Such instances of intolerance, however, afforded but feeble presage of the fearful hurricane that at last arose.

The attack commenced in Seville in 1391, where the minds of the citizens were inflamed by a sermon which an archbishop delivered in the cathedral. Individuals among the Jews were insulted and plundered. The attempts made by the civil authorities to restrain the popular fury increased its violence, till at last a general attack was made upon the Jews' Quarter, and of 7000 families upwards of one half were put to death, while the remainder sought for safety by a pretended conversion to Christianity. The example was followed in Cordova, Toledo, Valencia, and in all the cities where the greatest communities of the Jews were to be found. Many thousands were butchered; not a few left the kingdom, seeking for refuge in Italy, Turkey, and the states of Barbary; and it is calculated that 200,000 were forced into a profession of Christianity. The condition of these converts, or pretended converts, was truly deplorable. Subjected to the suspicions of the Christians, and to the hatred of those of their countrymen who continued stedfast to their ancient creed, many of them found their situation altogether insupportable, and became voluntary exiles. Not a few returned to the profession of Judaism, choosing rather to brave all the horrors of persecution than to submit to the odium of a suspicious apostacy.

The government showed its disposition to protect those who did not depart from the Jewish religion; several of the princes were opposed to extreme measures; and affairs began to wear a more favourable aspect. But the calm was only temporary. The sincerity of the whole of the Jewish converts, or, as they were called, the *New Christians*, began to be questioned. The honour of the church was considered as at stake; and, by the influence of Alphonso of Godeja, a bull was obtained from Pope Sixtus IV. for the institution of the inquisition, effectually to prevent a return to Judaism. The queen, the Jews, even the Cortes, resisted the introduction of this dread tribunal; but the priesthood prevailed. The tribunal was opened in Seville, and invested with full power to summon every individual suspected of secret attachment to Judaism. The unsparing energy with which it was to proceed was marked by the fact, that in a short time Seville numbered more prisoners than inhabitants; and in the course of a single year, in that city and in the immediately surrounding country, upwards of 2000 were put to death, several were imprisoned for life, and 17,000 were subjected to corporal punishment. At last a large stone building was constructed for containing a multitude

Jews.

of prisoners, combustible materials were placed around the outside of the walls, while the wretched inmates were left to perish by a slow death. Four inferior inquisitions were erected in other quarters, and each tribunal received the strictest injunctions to use every effort to preserve the church from the stain of a return to Judaism. The different signs that were supposed to indicate a secret attachment to the abjured religion were defined by law; and wherever any one of them was observed, the individual was to be brought to trial. A free pardon was offered to those who confessed their guilt, if they evinced the sincerity of their contrition by revealing the names of such as had shared with them in their deceit. The rabbis were forced, upon their oath, to declare if they knew any who secretly adhered to the hated worship. Death was the punishment of concealment. The fiercest civil war, the wildest incursion of barbarous hordes, could not have occasioned the deaths of so many innocent men, or annihilated so many sources of advantage to the kingdom. The impolicy was not less infatuated than the injustice and cruelty were monstrous.

Hitherto the persecution had been confined to those who were suspected of insincerity in their profession of the catholic faith; it was now to be extended to wider limits. The arms of Ferdinand and Isabella had been prosperous against the Moors, and the soil of Spain was freed from the infidel race. The inquisition gave the horrid promise of torturing the new Christians into sincerity, or of destroying them by death; and nothing now remained but the expulsion of the Jews to deliver the kingdom from every taint of heresy. The ambition of the crowned heads became alive to the glory and advantage of reigning over a land purified from all admixture of error, and in 1492 the order was given, that within four months every Jew should leave the country. Upon the issuing of this memorable edict, the minds of the unhappy people were filled with astonishment and horror. From the one end of Spain to the other, the voice of lamentation was lifted up. But superstition is inexorable; and the appeal to the justice or mercy of Ferdinand or his queen was alike in vain. The decree was passed, and it was not to be recalled. The Jews now acted worthy of the high character which they had sustained in Spain for nearly a thousand years. The resource of apostacy still remained; but the temptation was spurned, and the sincerity of their attachment to their faith was shown by their preferring it to everything. Upwards of 300,000 left all that was dear to them on earth, and went forth in search of lands where they might be allowed to worship the God of their fathers in peace. But misfortune continued to follow them on their path. The account of their sufferings is heart-rending; our limits permit us only to mention in general, that the richer part of them withdrew first to Portugal, where the Jewish faith had been hitherto tolerated. But the contagious influence of the proceedings in Spain extended to the sister kingdom; and the wretched exiles, after being made the objects of new forms of cruelty and injustice, were at last expelled from that kingdom also. Others, who directed their course for the states of Barbary and Morocco, were subjected to the horrors of shipwreck and pestilence; some were set ashore on desert islands by the inhuman shipowners, and some were sold as slaves. Some went to Italy, where the hardest fate of all awaited them, in the cruelty with which their own countrymen refused to receive them. Thousands lay perishing for hunger on the shore, till even the pope (Alexander VI.) interfered by a sentence of banishment against the resident Jews. But, notwithstanding all the sufferings to which they were exposed, and which so materially diminished their numbers, flourishing communities were formed by the offspring of the exiles in Barbary, Turkey, Italy; and this perhaps more than any thing else evinces how great multitudes had been sent into banishment.

In Spain there were now no professed Jews. There were still, however, many secret adherents of the proscribed faith. Of these, many were so dexterous in the concealment which they practised, as to escape every effort for their detection; and some of them were seated as judges in the very inquisition that had been instituted for their destruction. Others, however, were less successful, and against them horrible cruelties were exercised under the Emperor Charles V. and by Philip II. and III.

The policy of the Spanish government was extended also to Naples, from which city the Jews were expelled by Charles V. The example, however, was not followed in other parts of Italy. In that country, from the time of Charlemagne, the legal position of the Jews was nearly the same as it was in Germany. They were placed under the protection partly of the popes and partly of the emperors, to both of whom they were bound to do homage. Here, as elsewhere, they were chiefly engaged in money-lending and in petty traffic. Their head-quarters was Rome, but numbers of them were to be found in all the other principal cities. The conduct of the popes varied in reference to the Jews, according to their personal character. Paul IV. was the first who shut them up in a confined quarter in Rome, called the Ghetto. By other popes they were compelled to assemble regularly in a church at stated periods, where sermons were preached for their conversion. They were subjected to many other galling interferences till the time of Sextus V. who annulled most of the vexatious regulations of his predecessors, and restored them to some degree of liberty.

The changes effected upon the character and condition of the Jews by the restoration of letters, and by the movements occasioned by the reformation, were less than upon any other portion of European society. There were indeed individuals among them who made noble use of the newly-discovered art of printing, and who were distinguished in the walks of literature and philosophy. But the great proportion of the people, excluded from all share in the government of the countries in which they lived, viewed the mighty changes which were taking place without interest or advantage. The great events that were stirring other men's minds into activity, freeing them from the shackles of ancient prejudices, and opening new views of human affairs, were looked upon by the Jews as a spectacle in which they had no concern. Their spirit was even more concentrated upon their individual gains and their national hopes; and in the progress of the human mind, and in the new views that were continually opening up, they saw nothing more than the fluctuations of a wild uncertainty, that wedded them with a deeper pride to the contracted principles of their unchanging rabbinism. On the other hand, the benefit of more enlarged views that began to be entertained upon the subject of liberty, and respecting the rights of citizens, were not for a long period extended to them; and it is not till within the last fifty years that an instance has been afforded of the full concession of the privileges of citizenship to a Jew.

Still the progress of civilization was silently preparing the way for greater justice being done to this people; and their conduct, in circumstances where they were allowed scope for the development of their better qualities, tended greatly to the removal of the predjudices that existed against them. In no history have we more remarkable illustrations of the great truths, that to enslave is to degrade, and that to render men useful citizens, it is essential to bestow upon them the rights of citizens.

Upon the revolt of the Netherlands, many of the Portuguese Jews (a name applied to all the Jews of the Spanish peninsula) took refuge from the persecutions of Philip II. and III. in that country. The distinctions on account of religion were to a certain extent removed, and the Jews of Amsterdam, Rotterdam, and Antwerp, vied, in the highest qualities of commercial greatness, with the citizens of the new republic. They were afterwards joined by many of their countrymen, but of a lower order, from Germany and Poland. Offshoots from the new community in Holland grew up in circumstances scarcely less favourable in Denmark and Hamburg. The continued persecution of the new Christians in Spain drove other Jews to seek their fortune in the Spanish and other colonies in the New World. They settled in the Brazils, and in some of the West India islands, with various fortunes; but many distinguished themselves by their regularity, and enterprise, and wealth, in such a way as to produce an impression favourable to their European brethren.

The recognition of the independence of the United States in America may be marked as the epoch that secured to the Jews the prospect of their being admitted to the full privileges of citizenship, and freed them from the disabilities that had been so long considered as inseparable from their religious condition. The fundamental principle of the new republic involved the treating of the Jews upon the same terms as the other inhabitants. It was not acted upon, however, throughout all the states, till the year 1822. They are now distinguished in no respect, except their religion, from any other part of the population. They have synagogues in New York, Philadelphia, Charlestown, Richmond; and much attention is paid by them to the education of the young.

The movements in America were intimately connected with the changes which soon afterwards took place in France; and to this may in some degree be traced the new policy that was observed in that country in reference to the Jews at the beginning of the revolution. Notwithstanding the edict of exclusion by Charles V., some Portuguese Jews had been allowed by Henry II. to settle in Bordeaux and Bayonne; and at a later period, the conquest of Alsace, and other changes, added some of their communities to the French dominions. The condition of these communities was taken into consideration in 1789, without any thing, however, being done in that year. But in 1791 they were admitted to equal rights as citizens. In 1806 a sanhedrim was assembled by Bonaparte at Paris; and, upon satisfactory answers being returned to certain queries proposed to them respecting their civil institutions, and their views as citizens and subjects, a plan for the organization of the Jews throughout the empire was adopted. The abuse made of their privileges in some of the provinces of the Rhine, led subsequently to partial restrictions in regard to money lending; and an effort was made to turn their attention to agricultural pursuits. The privileges conferred by Bonaparte were not interfered with upon the restoration of the Bourbons; and, since the revolution in 1830, the Jewish rabbis, as well as the clergy of the different Christian sects, receive a stipendiary allowance from the state. Though by no means approving of such a measure, we conceive it to be worthy of remark, that the minister by whom it was proposed supported it upon the ground that they had shown themselves deserving of the patronage of the state, having, during the preceding quarter of a century, acted in such a way as to give the noblest refutation to all the slanders of their enemies.

At a national assembly held in 1796, they were declared as in every respect citizens of the Batavian republic; and the union of France with Holland led to the removal of every disability of the Dutch Jews.

In Germany little change had taken place in the condition of the Jewish inhabitants for many centuries. The diet of Frederick the Great (1750), for the regulation of his Jewish subjects, was of the most intolerant description. The severest measures were resorted to for preventing their increase beyond a fixed number. They were excluded from all civil offices, and from many departments of lucrative and honourable employment, and subjected to an unequal load of taxation. Their condition in other parts of the empire was not more favourable till towards the end of the last century. Various circumstances contributed about that period to a decided improvement. Among these, the writings and character of Moses Mendelsohn may be mentioned as having had considerable effect in elevating the character of the people in the general opinion. An edict of toleration was published by the Emperor Joseph II. The most important part of it perhaps consisted in the attention it directed, and the support which it promised, to elementary education, and to its throwing open the schools and universities of the empire to the Jews. Freedom of residence and of trade was also granted to them. They were no longer excluded from public places of amusement; and they were permitted to wear certain decorations, and might be created barons. The influence of Bonaparte was exerted for the advantage of the Jews in many parts of the German states; and from 1809 to 1813, we find ordinances issued for the melioration of their condition, admitting them to civil rights, and abolishing odious distinctions. By an act of the congress of Vienna in 1815, the diet is pledged to turn its attention to the melioration of the state of the Jews; and it may be safely affirmed that their condition has of late years been of progressive advancement. In the Rhenish provinces of Prussia, some restrictions have taken place in their privileges, by disqualifying them for certain civil offices; and, in 1822, their learned men were excluded from holding offices in schools or universities. In the free towns, commercial jealousy more than feelings of a religious nature still places the Jews in some respects at disadvantage.

In Switzerland, the privileges which the Jews enjoyed during the reign of Bonaparte have been done away. In Italy also their condition is less favourable than formerly. In the ecclesiastical states they are again shut up in the Ghetto, and 300 every Sabbath are obliged to hear a sermon for their conversion; in 1829 a proposal was made for banishing them from the dominions of the pope, which, however, has not been carried into effect.

The greatest accumulation of the Jews in any one point is in the countries of ancient Poland, now divided amongst the emperors of Russia and Austria and the king of Prussia. Their state has long continued fixed. They form the middle class between the nobles and the serfs, occupying all the common branches of traffic. The rabbinical spirit exists here in greater severity than in any other country. The Austrian emperors have shown a laudable zeal for the melioration of the condition of their Jewish subjects. The Emperor Nicholas of Russia, though his attention has been directed to the subject, has shown a less enlightened spirit.

In England the Jews again obtained a legal re-establishment under the protectorate of Cromwell, and have ever since maintained their footing. A bill for their naturalization was passed in the year 1753; but the prejudices against the measure were so strongly expressed, as to lead to its repeal in the following year. They are still excluded from civil offices, and are subjected to certain restrictions that interfere with some departments of their trade; but their rights have of late years been made the subject of discussion, with every prospect of a favourable issue.

The number of Jews at present existing cannot be accurately ascertained, but it is conjectured to amount to between five and six millions. In Asia, they are to be found on the coast of Malabar, in Persia, in Bokhara, in Mesopotamia, in Arabia, and in Palestine, and may amount to about one million. Along the whole of the northern coast of Africa they are to be met with in considerable numbers, and they are probably underrated at half a million. In Europe they have been supposed to amount to two or three millions. The Jews of Poland have been variously estimated at from a half million to four or five times that number; in Prussia, there are 200,000; in the Netherlands, 80,000; in France, 60,000; in Italy, 30,000; in Great Britain, 12,000. They are to be found in numbers gradually decreasing from this to a few hundreds, in Cracow, the Ionian Isles, Denmark, Switzerland, Sweden. In America they are estimated at 12,000.

For information as to the different sects of the Jews, their antiquities, literature, customs, and respecting the means which have been employed for their conversion to the Christian faith, we must refer the reader to other parts of this work. (D. D. D. D.)

JEZIDES, amongst the Mahommedans, a term of similar import with heretics amongst Christians. The Jezides are a numerous sect inhabiting Turkey and Persia, and so called from their head, Jezid, an Arabian prince, who slew the sons of Ali, Mahommed's father-in-law; for which reason he is reckoned a parricide, and his followers heretics. There are in Turkey and Persia many Jezides, who are of two sorts, black and white. The white are clad like Turks, and distinguished only by their shirts, which are not slit at the neck like those of others, but have a round hole to thrust their heads through. The black Jezides, though married, are the monks or religious persons of the order; and they are called Fakirs.

The Turks exact excessive taxes from the Jezides, who in their turn hate the Turks as their mortal enemies; and when, in their wrath, they curse any creature, they call it Moslemin. They are extremely ignorant, and believe both the Bible and the Koran without reading either. All the adoration they pay to God consists of some songs in honour of Jesus Christ, the virgin, Moses, and sometimes Mahommed; and it is a principal point of their religion never to speak ill of the devil, lest he should resent the injury if ever he were to come into favour with God again, which they think possible. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. When they get wine, they drink it to excess; and it is said that they sometimes do this with a religious purpose, calling it the blood of Christ.

JEZIRA-UL-OMAR, a town of Koordistan, situated on a low sandy island in the Tigris, about three miles in circumference, and environed with mountains. It covers the greater part of the island, and is defended by a stone wall now fallen into decay. It occupies the site of the ancient Roman fortress of Bezabde.

JEZRAEL, or JEZREEL, a town in the north of Samaria, towards Mount Carmel, where stood a palace of the kings of Israel, and upon the borders of Galilee. It was said to be one of the towns of Issachar. The valley of Jezreel, situated to the north of the town, runs from west to east for ten miles, between two mountains, the one to the north, commonly called *Hermon*, near Mount Tabor, the other *Gilboa*; and it was in breadth two miles.

JHALAWAN, a territory in the western part of Persia, forming the most southerly province of Beloochistan, and bordering on Mekran and Sinde. It is a very mountainous tract, divided into districts, which furnish each its quota of troops to the chief, Mahommed Khan.

JHANSI, a considerable town of Hindustan, in the province of Allahabad, district of Bundelcund. It has a strong citadel, situated on a hill which commands the town. It has a manufactory of bows, arrows, and spears, the weapons still in use among the barbarous tribes of the country. The surrounding district is valued at L.50,000 per annum, and belongs to a Hindu chief, one of the British allies. Long. 71. 45. E. Lat. 25. 31. N.

JHANSU-JEUNG, a castle in Thibet, standing on a perpendicular rock, which, from its height, seems to be nearly impregnable. It is surrounded by a populous and well-cultivated valley, which is famous for the manufacture of woollens. Long. 89. 23. E. Lat. 28. 50. N.

JHINGWARA, a Coolee state in the province of Gujerat, and district of Chalawar, containing between 5000 and 6000 houses. It is chiefly ruled by different branches of the same family, of which that of Virajee is the most powerful. The inhabitants are mostly Coolees, who have been degraded from their original rank of rajpoots. It was formerly much larger than it is at present, and was celebrated for a temple dedicated to the sun. On the banks of the Run, near this, a large quantity of salt is prepared, which is also a source of revenue.

JHURJHOORY, a village in the dominions of Nepaul, to the south of which lies the Jhurjhoory Forest, which is about ten miles in breadth, and contains all the finest woods. It is a wretched village, consisting of a few herdsmen's huts, scattered on the south bank of the Bukkia, the bed of which is here of considerable breadth. Long. 85. 20. E. Lat. 27. 4. N.

JHYLUM, JELUM, BEHUT, or VIDUSTA, the ancient Hydaspes, a large river of Hindustan, which has its rise in the south-east corner of the valley of Cashmere, in the great Himalaya ridge of mountains. It is there called Vidusta, and passes through two lakes east and west of the town of Cashmere. It is joined, ten miles below the town, by the Little Sinde, and receives many small rivulets in its course through the valley and hills, which it enters at Baramoola; and, four miles below Moozufferabad, it receives the Kishungunga from the north; its course thus far being nearly west. From this it takes a great curve to the south, and near Jelum it is little known, the country being so excessively mountainous that few travellers ever pass that way. In its course through the hills this river is very rapid, and from 100 to 200 yards broad. It is not fordable at any season, though in many places nearly so, as men and horses cross with ease, having only fifteen or twenty yards to swim. After a course of 450 miles, it joins the Chunab at Trimmoo Ghat, eighteen miles below Jhung, and ninety-five above Moultan, in which it loses its name. These joint streams, called the Chunab or Chunha, receive the Ravee forty-eight miles lower down, near Fazilshah and Ahmedpoor, from the eastward, and pass four miles north of Moultan, retaining the name of Chunab to within seven miles of Ooch, where they are joined at Sheeneebukree by the Gharra, or joint streams of the Beyah and Sutledj, 112 miles below Moultan, and sixty miles below Buhawulpore. From this point to Mittenda Khot, where they fall into the Indus, about seventy-six miles, these five streams take the name of the Punjab. The Indus, and the Punjab, or the five rivers, run parallel to each other for this distance, which is about ten and a half miles. The whole of this space is one complete sheet of water during the rains and hot season, and appears as one river. The greatest breadth between the Jhylum and the Indus appears to be 114 miles from Attock to Jellalapore Ghat. The whole course of the Jhylum, including its windings, may be estimated to exceed 400 miles.

Jib ‖ Jidda.

JIB, the foremost sail of a ship, being a large stay-sail, extended from the outer end of the boltsprit, and prolonged by the jib-boom, towards the fore-top mast head. See Sail.

Jib-Boom, a boom run out from the extremity of the boltsprit, parallel to its length, and serving to extend the bottom of the jib, and the stay of the foretop-gallant mast. This boom, which is nothing more than a continuation of the boltsprit forward, to which it may be considered as a top-mast, is usually attached to the boltsprit by means of two large boom-irons, or by one boom-iron, and a cap on the outer end of the boltsprit; or, finally, by the cap without and a strong lashing within, instead of a boom-iron, which is generally the method of securing it in small merchant ships.

JIDDA, or Djidda, a considerable commercial town, the port of Mecca, situated on the eastern shore of the Red Sea. It is built on a slightly rising ground, the lowest side of which is washed by the sea, and extends along the shore, in its greatest length, about 1500 paces, and is about half that space in breadth. It was encompassed with a wall in 1540; but as this ancient defence has long since fallen into a state of ruin, a new wall has been constructed on the land side, by the joint labours of the inhabitants, to guard against the incursions of the Wahabees. It is in a tolerable state of repair, but is of no strength; though it is a sufficient barrier against the Arabs, who have no artillery. Watch-towers, with a few rusty guns, are erected at the distance of forty or fifty paces; a narrow ditch is carried round it to increase the means of defence; and it enjoys throughout Arabia the reputation of an impregnable fortress. At the northern extremity stands the governor's residence; and on the southern is a small castle, mounting eight or ten guns. The whole harbour is commanded by a battery, in which is mounted an immense old piece of ordnance, which carries a ball of 500 pounds, and, says Burckhardt, "is so celebrated all over the Red Sea, that the very fame of it is a protection to the port." The approach to the town by the sea is by two quays, where small boats discharge the cargoes of large ships; these last being obliged to anchor in the roadstead, about two miles from the shore. The quays being shut every evening after sun-set, all communication is prevented at night between the town and the shipping. On the land-side Jidda has two gates, the Bab-Mekka on the east side, and the Bab-el-Medina on the north. Along the area enclosed by the modern wall, and by the sea on the west, a broad piece of open ground extends the whole length of the interior wall; there is also a good deal of waste ground near the Medina gate, and on the southern extremity. The suburbs consist of miserable huts of reeds, rushes, and brushwood, inhabited by Bedouins or poor peasants and labourers, who live after the Arab fashion. The most respectable inhabitants reside near the sea, where there is a long street parallel with the shore, lined with shops, and containing many khans, exclusively frequented by merchants. Jidda is well built; the streets, though unpaved, are spacious and airy; and the houses are high, consisting mostly of two stories, with many small windows and wooden shutters, and wholly constructed of stone, mostly brought from the sea-shore, but consisting of madrepores and other marine fossils. They have generally a spacious hall at the entrance, where, at noon, the master, with all his male attendants and slaves, may be seen enjoying a siesta. No attention is paid to uniformity of architecture. Some houses are built with small, others with large square stones; sometimes the walls are entirely of stone, whilst at other times layers of plank are placed at intervals in the wall. When the walls are plastered, the dazzling white, during the glare of the sun, is extremely distressing to the eye. There are no buildings of ancient date, owing to the rapid decay of the madrepore, of which they are constructed, when it is exposed to the rain and the moist atmosphere prevalent on the shores of the Red Sea. The town contains, besides many small mosques, two of considerable size. The governor's habitation is a paltry building, as also that of the collector of the customs. The khans are, many of them, well built, and have good accommodation for the foreign merchants, whose residence they are during their short stay in the town. Water is scarce in Jidda, as in most of the Arabian towns. Several of the wells are private property, and yield their owners a considerable income. Every town of moderate size has its cisterns; but the rains not falling in sufficient abundance to afford an adequate supply to the town, the inhabitants are forced to have recourse to pools formed outside of the town in the rainy season. This water is not so good as the rain-water, which is esteemed a delicacy; and though water is everywhere found at the depth of fifteen feet, it is of a bad quality, and scarcely fit for use. There are only two wells that afford sweet water, which is wholly consumed by the rich. The poorer classes use the water supplied by the other wells, to which, being of indifferent quality, their ill health is ascribed. The town of Jidda is surrounded by a barren desert, without gardens or vegetation of any kind, except a few date-trees adjoining one of the mosques, or a few shrubs and low acacia trees. Beyond the Mecca wall, and on the road to this place, are huts inhabited by poor Bedouins, camel-drivers, and negro hadjis or pilgrims, who gain a livelihood by cutting wood in the mountains. About a mile beyond these huts, eastward of the town, is the principal burial-ground, containing the tombs of several sheiks. There are also several cemeteries within the walls.

The inhabitants of Jidda, like those of Mecca and Medina, are almost exclusively foreigners, and consist, in many cases, of rich merchants, who come on their pilgrimage to Mecca with large adventures of goods, and, not being able to settle their accounts immediately, they wait another year. In the mean time, cohabiting with Abyssinian slaves, whom they marry, and finding themselves with a family, they at last settle in the country. Every pilgrimage thus adds to the population of Jidda, as of the other Arabian towns, and recruits the waste occasioned by the surplus of the deaths over the births. The natives of Jidda are only a few families of Sherifs, who are all of the learned order, and are attached to the mosques or the courts of justice. All the others are foreigners, or their descendants. Colonies from every town and province of Hadramaut and Yemen are settled in Jidda, and maintain an intercourse with their native places. There are upwards of a hundred Indian families from Surat, and a few from Bombay; also Malays, and people from Muskat. The settlers from Egypt, Syria, Barbary, European Turkey, and Anatolia, may be still recognised in the features of their descendants. No Christians are settled in Jidda; but a few Greeks from the islands of the archipelago occasionally bring merchandise to this market from Egypt. Jews were formerly the chief brokers of the town, but they were all expelled about fifty or sixty years ago by some of the governors.

Jidda is a great emporium of maritime commerce, and well merits the Arabian appellation of Djidda, or rich, being probably richer than any town of the same size in the Turkish dominions. The inhabitants are mostly all engaged in commerce, and pursue no manufactures or trades but those of immediate necessity. They are all either sea-faring people, traders by sea, or engaged in trading with Arabia. Jidda not only derives its riches from being the port of Mecca, through which numerous bands of pilgrims pass in their journey to the holy place, but it is an entrepôt of eastern commerce, through which all the exports of India and Arabia destined for Egypt first pass. All bargains are chiefly for ready money, the bad faith of the eastern merchants not being favourable to credit. Sales and purchases are made of entire ships' cargoes in the course of half an hour, and the next day the money is paid down. Its commerce may be divided into two principal branches, namely, the coffee trade and the Indian trade. Ships laden with coffee arrive from Yemen all the year round, and dispose of their cargoes for cloths, linen stuffs, and beads, but chiefly for dollars, which they take back to their own country. The demand for Arabian coffee in European Turkey, Asia Minor, and Syria, has been in a great degree superseded, since the termination of the war in Europe, by West India coffee.

The fleets from India, from Calcutta, Surat, and Bombay, reach Jidda in the beginning of May; their cargoes of Indian goods are immediately bought up by the merchants of Jidda, or on account of Cairo merchants, who send money to Jidda for the purpose. The greater part of the merchandise is shipped for Suez, and sold at Cairo, whence it finds its way into the Mediterranean. The returns are made either in goods or in dollars and sequins, large quantities of which are carried off annually by the Indian fleet. There are several rich merchants in Jidda. Burckhardt, on whose accurate information this account is chiefly founded, mentions two merchants whose grandfathers were the original settlers, and who had each a capital of from L.150,000 to L.250,000. Several Indians, he adds, had acquired capitals nearly equal; and there were about a dozen of houses possessing from L.40,000 to L.50,000 sterling. The vessels belonging to Jidda amount to about 250. It trades by land only with Mecca and Medina. A caravan, of from sixty to a hundred camels, departs for Medina every forty or fifty days, principally with India goods and drugs, and is always augmented by a crowd of pilgrims, who wish to visit Mahommed's tomb. There is another caravan for Mecca every evening, or at least twice a week, with goods and provisions. During the pilgrimage these caravans set out regularly every evening after sun-set from the Mecca gate; also a caravan of asses, which perform the journey in fifteen or sixteen hours. It is by this caravan that letters are conveyed between the two towns. There are twenty-seven coffee-shops in Jidda, where coffee, as in most parts of Arabia, is drunk to excess, and various other shops for the sale of butter, which is a chief article of Arabian cookery; honey, oil, vinegar, fruits, dates, beans, &c.; sweet-meats, sugar-plums, bread, milk; corn, consisting of Egyptian wheat, beans, lentils, dhourra, Indian and Egyptian rice; biscuits, salt, tobacco, soap, drugs, spices, sugar, perfumery, incense, &c. There are also shops for articles of Indian manufacture, for the sale of clothes chiefly after the Turkish fashion, carpets, Indian piece goods. There are, besides, bankers, bakers, tailors, and one watch-maker. The number of inhabitants may be estimated in general at from 12,000 to 15,000; but during the months preceding the pilgrimage, and the summer months, when the Indian fleets arrive with the monsoons, the influx of strangers swells the population one half above its usual number. Long. 39. 15. E. Lat. 21. 29. N.

JIGAT POINT, a town and promontory at the south-west extremity of Gujerat, situated on the Goomty, which is an asylum for pirates, the people of this country being much addicted to piracy, in which they are encouraged by their chiefs. It has a Hindu temple dedicated to Krishna. Long. 69. 7. E. Lat. 22. 12. N.

JIHON. See OXUS.

JILLIFREY, a town of Africa, situated on the southern bank of the Gambia, near the mouth of that river. Although not the capital, it is the chief place of trade of the flourishing little kingdom of Barra; and the king has here a custom-house, by which duties on vessels passing up and down the river are levied. Long. 16. 7. W. Lat. 13. 16. N.

JIN. See GENII.

JIONPOOR, or JOANPORE, a district of Hindustan, in the province of Allahabad, included principally between the twenty-fifth and twenty-sixth degrees of north latitude. It is situated between the river Gogra on the east, and the Ganges on the south; to the north it is bounded by the Gogra and part of Oude; and on the west it has the nabob of Oude's territories. It is well watered, and extremely fertile; and the soil is under good cultivation, and well covered with wood. The inhabitants are Mahommedans and Hindus, in nearly equal proportions. Of the Hindus there was one tribe amongst whom the practice of female infanticide greatly prevailed; but, by the humane influence of the British government, it has been in a great measure abolished. This district came into the possession of the British in 1775, as forming part of the Benares zemindary. The principal towns are Jionpoor, Gazypoor, and Azimgar.

JIONPOOR, the chief town in the above district, and formerly the capital of an independent principality. It is situated upon the banks of the Goomty. The fort, which is built of solid stone-work, was founded in 1370, by Sultan Feroze III. of Delhi, and named after his uncle and predecessor, whose name was Joana. He ordered a Hindu temple to be levelled, and erected the fort around the ruins of it. After his return to the capital, he collected numerous artificers, and persons of every description, and sent them to inhabit the new city, which was completed in twelve years. On the subversion of the empire of Delhi by Timour or Tamerlane, Khuaje Jehan, a governor of the eastern districts, assumed the royal dignity, and he made Jionpoor his capital. He was succeeded in 1399 by his son Mobarik Shah, whose successor was Sultan Ibrahim. During his prosperous reign of forty years he spared no expense to strengthen and improve the fortress and city, and Jionpoor became one of the most celebrated cities of Hindustan, famed for religion and learning. Jionpoor was again annexed to the empire of Delhi in the year 1478, when the reigning prince was overthrown. Many of the mosques, and some of the caravanserais and colleges built at that period, are still in existence. The fortress is built upon a high bank of the river Goomty, so named from its meandering course. It is built of solid stone, and rises considerably above the level of the surrounding country. It was frequently taken in the contests between the Afghans and the Moguls, and much dilapidated; but about the year 1570 it was thoroughly repaired by a nobleman from the court of Akbar, who was governor of Bengal. It was also during his time that the celebrated bridge of Jionpoor was built, which has now stood 250 years, and still remains a monument of ancient magnificence and of architectural skill. In 1773, when this bridge was submerged during the rainy season, a brigade of British troops sailed over it. Such is the strength and solid construction of this bridge, that it suffered no damage from the violence of the current. The town surrounds the fort on three sides, and contains a good bazar and a number of brick houses. The surrounding country for several miles is covered with the ruins of tombs and mosques. Of the latter there are several in a good state of repair, namely, the Jamai Musjed, which is very handsome, and is built of stone. The travelling distance from Benares is forty-two miles, and from Lucknow 147 miles. Long. 82. 39. E. Lat. 25. 45. N.

JOAB, general of the army of King David, who defeated the Syrians and the other enemies of David, and took from the Jebusites the fort of Zion, considered by them as impregnable. He also signalized himself in all David's wars, but was guilty of basely murdering Abner and Amasa. He procured a reconciliation between Absalom and David; and afterwards slew Absalom, contrary to the express orders of the king. He at length joined Adonijah's party, and was put to death by the order of Solomon, in the year before Christ 1014.

JOACHIMITES, in *Ecclesiastical History*, the disciples of Joachim, a Cistertian monk, who was abbot of Flora in Calabria, and a great pretender to inspiration.

The Joachimites were particularly enamoured of certain ternaries. The Father, they said, operated from the beginning till the coming of the Son; the Son, from that time till their own era, which was the year 1260; and from the latter epoch the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and to the manner of living, into three classes, according to the three persons in the Trinity. The first ternary consisted of men, the first class of whom was that of married men, which had lasted during the whole period of the Father; the second was that of clerks, which had lasted during the time of the Son; and the third was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit. The second ternary was that of doctrine, namely, the Old Testament, the New Testament, and the everlasting Gospel; the first of which they ascribed to the Father, the second to the Son, and the third to the Holy Spirit. A third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the flesh and the spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOAG, a town of Western Africa, and capital of the kingdom of Kajaago. See KAJAAGO.

JOAL, a sea-port on the western coast of Africa, in the small kingdom of Bar-Sin. Formerly a considerable slave trade was carried on here; but cattle, poultry, and other provisions are what it now chiefly supplies. Very large vessels, however, cannot enter the port, on account of a sand-bank which stretches across the mouth of the harbour.

JOAN, POPE, called by Platina, John VIII., a woman said to have occupied the holy see between Leo IV. who died in 855, and Benedict III. who died in 858. Marianus Scotus says that she occupied the pontifical chair two years five months and four days. Numberless have been the controversies, fables, and conjectures, respecting this pope. It is said that a German girl, pretending to be a man, went to Athens, where she made great progress in the sciences; and that she afterwards repaired to Rome, still indued with the male habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures of the time, her great learning was admired, and every one loved her extremely; so that after the death of Leo, she was chosen pope, and performed all offices as such. But whilst she was in possession of this high dignity, she became pregnant; and as she was going in a solemn procession to the Lateran church, she was delivered of a child, between the Coliseum and St Clement's church, in a public street, before a crowd of people, and died on the spot, in 857. By way of embellishing this story, it has been alleged that precautions were afterwards taken to prevent the recurrence of a similar accident.

JOAN *d'Arc*, commonly called the Maid of Orleans, whose heroic behaviour, in re-animating the expiring valour of the French nation, deserved a better fate. To accomplish this object, she pretended to be inspired; and, in her character of prophetess as well as heroine, succeeded in infusing new energy into her countrymen. But her enemies were not deceived as to her real character; they regarded her merely as a bold and successful impostor; and accordingly, when she fell into their hands, they put her to death. She was burned by the English as a sorceress in 1421, at the age of twenty-four. See FRANCE.

JOANA, a town on the northern coast of the island of Java, formerly fortified. It is situated a few miles inland, on the river Joana, along which it extends about a mile. The surrounding country yields rice, timber, and the natives are employed in spinning cotton. The river on which the town is situated is the longest and deepest in the country. It flows out of a deep lake, to which it is navigable by boats; and it has several branches, one of which communicates with Samarang.

JOANES, Dos, a large island of South America, situated at the mouth of the river Amazons, in the province of Para. It is separated from the mainland west of the river Toccantins by the Strait of Tagyparu on the south, and extends ninety miles from north to south, and one hundred and twenty from east to west. It is one of the best peopled districts in the province; and, from its extensive grazing farms, Para, the capital, which is opposite to it, draws its chief supply of meat. The island contains many small towns and villages, and a considerable population of all castes and shades; but the Indians, who are very imperfectly civilized, are the most numerous. The climate is hot, but tempered by the ocean breeze.

JOAO DEL REY, a town of Brazil, in the extensive country of Minas Geraes. It is surrounded by mountains, and lies partly on the side of an eminence and partly on a plain, being divided into two by the small river Tijuco. The town is compact, of a circular form, and has the general appearance of all Portuguese towns of the same class. The houses are low, white-washed, and furnished with latticed windows. The streets are narrow, crooked, far from uniform, and very slippery, being paved with large, smooth, blue stones, with a channel in the middle. The site of the buildings is so irregular, that they overtop each other, the conspicuous points being selected for public offices and the best private dwellings. The government-house is a large, substantial building, well situated for observing what passes in the town, and for the despatch of public business. Adjoining to it are the public offices, which form one side of an unfinished square; on the other stand some plain, substantial houses; and in the centre, the pillar of public executions, surmounted by a figure of Minerva, invested with the insignia of justice. The jail, a large and strong building, is situated in the principal street. There are thirteen churches, amongst which is a sort of metropolitan church, built in taipé or paysan. Its exterior is mean, but it contains within some very remarkable ornaments. A brisk trade is carried on between this town and the capital, by means of caravans, conveying thither bacon, cheese, some cottons, woollen hats, horned cattle, mules, and gold bars, and bringing back in return European goods, chiefly Portuguese and English, such as calicoes, handkerchiefs, lace, iron-ware, wine, porter, and liqueurs. Though the environs are very mountainous and bare, and seem to be thinly peopled, yet, in the clefts of the mountains and valleys many *haciendas* are scattered, which furnish the necessary supplies of maize, mandioc, beans, oranges, tobacco, a small quantity of sugar and cotton, cheese in abundance, cattle, swine, and mules; whilst the streams, which are full of fish, contribute to the supply of food. Formerly the chief occupation of the people was searching for gold. The mine to which the town owes its origin and celebrity, and whence such masses of mineral wealth have been extracted, is situated within the town, near the government-house. It is nothing but a deep pit, having perpendicular sides, and always full of water during the rainy season. The labour and expense of procuring the precious metal under such circumstances, together with the ignorance of the mechanical arts here, present insuperable obstacles to the full produce of the mine being obtained, and the greater part of the gold dust brought to the smelting-house comes from other quarters. The lower classes in this town are idle and profligate; a social condition which in some measure may be ascribed to the general want of education amongst the inhabitants. The town is governed by a *desembargador*, or supreme judge. It has also an attorney-general, a vicar, and a royal Latin professor. The population amounts to about 6000, of which only one third are white people, the rest being negroes and mulattoes. The colour of the white people constitutes an exemption from toil; and those who do labour, occupy themselves on farms, in superintending shops, or in filling places of public trust, and in discharging the duties of religion and justice. Others are employed at woollen manufactories in the neighbourhood, the cloth being prepared from an article of native produce. This town is stated to be eighty miles south-west of Villa Rica, about the same distance south-south-west of Sabara, and upwards of two hundred miles north-west of Rio.

JOB, or *Book of* JOB, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was Job, as a trial of his virtue and patience; together with the conferences which he had with his friends on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, and elevated, and figurative expressions, which constitute the essence of poetry.

Many of the Jewish rabbin pretend that this relation is altogether fictitious; and others think it a simple narrative of a matter of fact just as it happened; whilst a third class of critics acknowledge that the groundwork of the story is true, but that it is written in a poetical strain, and decorated with peculiar circumstances, to render the narrative more profitable as well as entertaining. The time in which Job lived is not mentioned. It has been thought that he was much more ancient than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was written by himself; others are of opinion that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew; but the rabbin generally held that Moses was the author of it, and many Christian writers are of the same opinion.

JOBBER, a person who undertakes jobs, or small pieces of work. In some statutes, jobber is used to signify a person who buys and sells for others. See BROKER.

JOBBING, the business of a jobber.

*Stock-*JOBBING denotes the practice of trafficking in the public funds, or of buying and selling stock with a view to its rise or fall. The term is commonly applied to the illegal practice of buying and selling stock for time, or of accounting for the differences in the rise or fall of any particular stock for a stipulated time, whether the buyer or seller be possessed of any such real stock or not.

JOCKEY, in the management of horses, the person who grooms or rides them. See, on this subject, HORSE and HORSEMANSHIP.

JOEL, or *the Prophecy of* JOEL, a canonical book of the Old Testament. Joel was the son of Pethuel, and the second of the twelve lesser prophets. The style of this prophet is bold, figurative, and expressive. He upbraids the Israelites for their idolatry, and foretells the calamities which they should suffer as the punishment of that sin; but he endeavours to support them with the comfort that their miseries would have an end upon their reformation and repentance. Some writers, inferring the order of time in which the minor prophets lived from the order in which they are placed in the Hebrew copies, conclude that Joel prophecied before Amos, who was contemporary with Uzziah, king of Judah. Archbishop Usher draws this inference from Joel's foretelling the drought (chap. iv. 7, 8, 9). But if we consider the main design of Joel's prophecy, we shall be apt to conclude that it was uttered after the captivity of the ten tribes; for he directs his discourse to Judah alone, and speaks distinctly of the sacrifices and oblations which were daily offered in the temple.

JOGHIS, a sect of religious persons in the East Indies, who never marry, nor hold any private property, but live on alms, and practise strange severities or mortifications. They are subject to a general, who sends them from one country to another to preach. They are, properly, a kind of penitent pilgrims, and supposed to be a remnant of the ancient Gymnosophists. They principally frequent such places as are consecrated by the devotion of the people, and pretend to live several days together without either eating or drinking. After having gone through a course of discipline for a certain time, they look upon themselves as impeccable, and privileged to do any thing; in consequence of which they give a loose rein to their passions, and run into all manner of debauchery.

JOGUES, or YUGS, certain ages, eras, or periods of extraordinary length in the fabulous chronology of the Hindus. They are (see Halhed's *Preface to the Code of Gentoo Laws*, p. xxxvi.) four in number, viz.

1. The Suttee Yug, or age of purity, which is said to have lasted three millions two hundred thousand years; and they hold that the life of man was extended in that age to one hundred thousand years, and that his stature was twenty-one cubits.

2. The Tirtah Yug, in which one third of mankind was corrupted, they suppose to have consisted of two millions four hundred thousand years, during which men lived to the age of ten thousand years.

3. The Dwapaar Yug, in which half of the human race became depraved, endured one million six hundred thousand years, during which the life of man was reduced to a thousand years.

4. The Collee Yug, in which all mankind were corrupted, or rather lessened (for that is the true meaning of the word *Collee*), is the present era, which they suppose ordained to subsist four hundred thousand years, and of which nearly five thousand are already past. The life of man in this period is limited to one hundred years.

Some account has already been given of the Indian chronology (see articles CHRONOLOGY and HINDUSTAN), and it is therefore unnecessary to recur to the subject in this place. But we may nevertheless subjoin Dr Robertson's observations on the above periods, from the Notes to his *Historical Disquisition concerning India*. "If," says he, "we suppose the computation of time in the Indian chronology to be made by solar, or even by lunar years, nothing can be more extravagant in itself, or more repugnant to our mode of calculating the duration of the world, founded on sacred and infallible authority. From one circumstance, however, which merits attention, we may conclude that the information which we have hitherto received concerning the chronology of the Hindus is very incorrect. We have, as far as I know, only five original accounts of the different Jogues or eras of the Hindus. The first is given by M. Rogers, who received it from the Brahmins on the Coromandel coast. According to it, the Suttee Jogue is a period of one million seven hundred and twenty-eight thousand years; the Tirtah Jogue is one million two hundred and ninety-six thousand years; the Dwapaar Jogue is eight hundred and sixty-four thousand. The duration of the Collee Jogue he does not specify (*Porte Ouverte*, p. 179). The next is that of M. Bernier, who received it from the Brahmins of Benares. According to him, the duration of the Suttee Jogue was two millions five hundred thousand years; that of the Tirtah Jogue, one million two hundred thousand years; that of the Dwapaar Jogue is eight hundred and sixty-four thousand years. Concerning the period of the Collee Jogue he is likewise silent (*Voyages*, tom. ii. p. 160). The third is that of Colonel Dow; according to which the Suttee Jogue is a period of fourteen millions of years, the Tirtah Jogue one million and eighty thousand, the Dwapaar Jogue seventy-two thousand, and the Collee Jogue thirty-six thousand years (*Hist. of Hindost.* vol. i. p. 2). The fourth account is that of M. le Gentil, who received it from the Brahmins of the Coromandel coast; and as his information was acquired in the same part of India, and derived from the same source, with that of M. Rogers, it agrees with his in every particular (*Mém. de l'Académie des Sciences pour* 1772, tom. ii. part i. p. 176). The fifth is the account of Mr Halhed, which has been already given. From this discrepancy, not only of the total numbers, but of many of the articles in the different accounts, it is manifest that our information concerning Indian chronology is hitherto as uncertain as the whole system of it is wild and fabulous. To me it appears highly probable, that when we understand more thoroughly the principles upon which the factitious eras or jogues of the Hindus have been formed, that we may be more able to reconcile their chronology to the true mode of computing time, founded on the authority of the Old Testament; and may likewise find reason to conclude, that the account given by their astronomers, of the situation of the heavenly bodies at the beginning of the Collee Jogue, is not established by actual observation, but the result of a retrospective calculation."

JOHANNA, or ANJOUAN, more properly Hinzouan. See HINZOUAN.

JOHANN-GEORGENSTADT, a city of the mining district of the kingdom of Saxony, in the circle of Freyburg, upon the frontiers of Bohemia. It contains 396 houses, and 3000 inhabitants, who are employed in extracting silver, tin, vitriol, sulphur, iron, and manganese, from the surrounding mines.

JOHANNISBERG, a town of the duchy of Nassau, in Germany, near the Rhine, containing about 700 inhabitants. It is celebrated for its wine. The most famous of the vineyards belonged formerly to the prince-bishop of Fulda, but now to Prince Metternich, who has a castle at the town, and is said to derive from his wine an income of L.4000 per annum. There is much other wine produced from the neighbourhood, of an excellent quality; but it is estimated lower than that of the prince.

JOHN, ST, the Baptist, the forerunner of Jesus Christ, was the son of Zacharias and Elizabeth. He retired into a desert, where he lived on locusts and wild honey; and about the year 29 began to preach repentance, and to declare the coming of the Messiah. He baptized his disciples, and the following year Christ himself was baptized by him in the river Jordan. Some time afterwards, having reproved Herod Antipas, who carried on a criminal correspondence with Herodias, his brother Philip's wife, he was cast into prison, where he was beheaded. His head was brought to Herodias, who, according to St Jerome, to revenge herself after his death for the freedom of his reproofs, pierced his tongue with the bodkin with which she used to fasten her hair.

JOHN, *St*, the Apostle or Evangelist, was the brother of St James the Great, and the son of Zebedee. He quitted the business of fishing to follow Jesus, and became his beloved disciple. He was witness to the actions and miracles of his Master, was present at his transfiguration on Mount Tabor, and attended him in the garden of olives. He was the only apostle who followed him to the cross, and to him Jesus left the care of his mother. He was also the first apostle who knew him again after his resurrection. He preached the faith in Asia, and principally resided at Ephesus, where he maintained the mother of our Lord. He is believed to have founded the churches of Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodicea. He is also said to have preached the gospel amongst the Parthanis, and to have addressed his first epistle to that people. It is related that, when he was at Rome, the Emperor Domitian caused him to be thrown into a caldron of boiling oil, but that he came out unhurt; upon which he was banished to the isle of Patmos, where he wrote his Apocalypse. After the death of Domitian he returned to Ephesus, where he composed his Gospel, about the year 96; and died there, in the reign of Trajan, about the year 100, at the age of 94.

Gospel of St JOHN, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death, of our Saviour Jesus Christ, written by St John the apostle and evangelist. At the desire of the Christians of Asia, St John wrote his Gospel at Ephesus, after his return from the isle of Patmos. St Jerome says he would not undertake it, except upon condition that they should appoint a public fast to implore the assistance of God; and that, the fast being ended, St John, filled with the Holy Ghost, broke out into the words, "In the beginning was the Word," &c. The ancients assign two reasons for this undertaking. The first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ's preaching till the imprisonment of John the Baptist, which therefore he applied himself particularly to relate. The second is, that it was written in order to remove the errors of the Cerinthians, Ebionites, and other sects. But Mr Lampe and Dr Lardner have urged several reasons to show that St John in his Gospel did not write against Cerinthus, or any other heretic.

Revelation of St JOHN. See APOCALYPSE.

JOHN, *St*, the name of several small towns, counties, rivers, lakes, bays, creeks, and capes of North and South America, all of which deserving of particular notice will be found described under the heads of the various states or provinces where they occur.

JOHN *of Salisbury*, bishop of Chartres, in France, was born at Salisbury, in Wiltshire, in the beginning of the twelfth century. Where he received the rudiments of his education is unknown; but we learn, that in the year 1136, being then a youth, he was sent to Paris, where he studied under several eminent professors, and acquired considerable reputation for his application and proficiency in rhetoric, poetry, divinity, and particularly in the learned languages. From Paris he travelled into Italy; and, during his residence at Rome, he rose into high favour with Pope Eugenius III. and his successor Adrian IV. After his return to England, he became the intimate friend and companion of the renowned Thomas-a-Beeket, archbishop of Canterbury, whom he attended in his exile; and he is said to have been present when that haughty prelate was murdered in his cathedral. What preferment he obtained in the church during this time does not appear; but in 1176 he was promoted by King Henry II. to the bishopric of Chartres in France, where he died in 1182. This John of Salisbury was one of the first restorers of the Greek and Latin languages in Europe, a classical scholar, a philosopher, a learned divine, and an elegant Latin poet. He wrote several books, the principal of which are, his Life of St Thomas of Canterbury, a collection of Letters, and Polycraticon.

Pope JOHN *XII.* a native of Cahore, originally called James d'Euse, was well skilled in the civil and canon law, and was elected pope after the death of Clement V. on the 7th of August 1316. He published the constitutions called *Clementine*, which were framed by his predecessor; and drew up the other constitutions called *Extravagantes.* When Louis of Bavaria was a candidate for the imperial crown, John XII. opposed him in favour of his competitor; which made much noise, and was attended with fatal consequences. That prince, in 1320, caused the antipope Peter de Corbiero, a Cordelier, to be elected, who took the name of Nicolas V. and was supported by Michael de Cesenne, general of his order; but that antipope was the following year taken and carried to Avignon, where he begged pardon of the pope with a rope about his neck, and died in prison some years afterwards. Under this pope arose the celebrated question among the Cordeliers, called "the bread of the Cordeliers;" which was, whether those monks had the property of the things given them, at the time they were making use of them; that is, whether the bread belonged to them when they were eating it, or to the pope, or to the Roman church. This frivolous dispute gave great employment to the pope, as also did those which turned upon the colour, form, and stuff, of their habits, whether they ought to be white, gray, or black; whether the cowl ought to be pointed or round, large or small; whether their robes should be full, short, or long; of cloth, or of serge. The disputes on these minute trifles were carried so far between the minor brothers, that some of them were burned upon the occasion. Pope John died at Avignon in 1334, aged ninety.

John of Fordun. See Fordun.

John of Gaunt, duke of Lancaster, a renowned general, father of Henry IV. king of England, died in 1438.

John Sobieski of Poland, one of the greatest warriors in the seventeenth century, was, in 1665, made grand-marshal of the crown, and, in 1667, grand-general of the kingdom. The victories he obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674. He was an encourager of arts and sciences, and the protector of learned men. He died in 1696, at the age of seventy-two.

St John's Day, the name of two Christian festivals; one observed on the 24th of June, in commemoration of the wonderful circumstances attending the birth of St John the Baptist; and the other on the 27th of December, in honour of St John the Evangelist.

JOHN'S Island, an island on the southern coast of Carolina, a little to the south-west of Charleston harbour. It is thirty miles in circumference, and is divided from James' Island by Stono River, which forms a convenient and safe harbour. Long. 80. 10. W. Lat. 32. 42. N.

John's, *St*, the capital of the island of Newfoundland. See Newfoundland.

John's, *St*, or *Prince Edward Island*, a fine island, situated in the Gulf of St Lawrence, within the longitudes of 62° and 65° W., and the latitudes of 46° and 47° 10′ N. It is 140 miles in length, and its greatest breadth is thirty-four miles. From Nova Scotia it is separated by Northumberland Strait, which is nine miles broad between Cape Traverse and Cape Tormentine. Cape Breton lies within twenty-seven miles of the east point; and Cape Ray, the nearest part of Newfoundland, is one hundred and twenty miles distant.

This island was discovered by Cabot on the 24th of June 1497, being St John's day, and hence derived its name. The English, however, neglected to avail themselves of this right of possession; and the French, who appear at first to have entertained more correct views of its importance, took possession of it, when they made the conquest of Canada, apparently without any remonstrance on the part of Britain. For a period of two hundred and thirty-five years it continued attached to the crown of France; and although it cannot be said to have advanced in prosperity with an average degree of celerity, considering the value at which such a possession ought to have been rated, yet the resources of the island had not been overlooked, and would probably have been called into activity, had it not been surrendered to Great Britain in 1758. At that time the population in the various settlements appears not to have amounted to more than 6000. At the peace of 1763, this colony and Cape Breton were annexed to the government of Nova Scotia; and a plan of settlement was agreed to, by which the island was divided into sixty-seven townships, of about 20,000 acres each, granted to individuals who were considered as having claims on the government, and who were to pay a small sum as quit-rent. A reservation was set apart for his majesty, and also for the purposes of religion and education; and the grantees were bound to settle each township within a stipulated period, by a given number of individuals. The plan, however, was unsuccessful, and many of the proprietors disposed of their lands to others who had either not the will or not the power to proceed with the colonization of the island, according to the principle originally fixed upon. In 1768, St John's was erected into a separate government from that of Nova Scotia, at the request of a majority of the proprietors; and a governor was appointed, who set vigorously about settling the island in a proper manner, and who did more in this respect than any other proprietor at that time. The colony obtained a complete constitution in 1773, when the first house of assembly met. During the American war, it continued true to the interests of the mother country, and was resorted to by ships of war, as well as converted into a military station. About the year 1790, two provincial corps were raised for the protection of the island, and three troops of volunteer cavalry were likewise formed. As a mark of respect for the Duke of Kent, commander of the British army in America in 1799, the island was then named Prince Edward Island; a very uncalled-for change from St John's, its most appropriate designation. Since that period no event has occurred of such moment as to require particular mention here.

This island, without being mountainous, or possessed of romantic scenery, is agreeably diversified by hill and dale; but the level is, in general, never so far deviated from as to interfere with the purposes of agriculture. There are no mountains, properly so called; but a chain of hills intersects the island breadthwise, about its middle. It abounds with streams, and springs of the purest water; and numerous arms of the sea penetrate so far inland that no part of the country is more than eight miles removed from the flux and reflux of the tide. When first seen, it presents the aspect of a flat country, covered with trees to the margin of the ocean; but, on a nearer approach, the more inviting prospect discloses itself, of villages and farms situated in valleys or on green and gentle declivities, with the other smiling features which result from agricultural industry or spontaneous fertility. Almost every part presents beautiful landscape views, especially in summer and autumn, when the forests exhibit an exuberance of rich and splendid foliage. Unlike Cape Breton, Newfoundland, and other contiguous islands, St John's is very rarely visited by fogs; and although the winter be equally severe, the transitions from one extreme to another are less violent. The season of cold is likewise less protracted than it is in Lower Canada, whilst the frost is not so intense, nor the snows so deep. Altogether the climate is very salubrious, and there are few countries where health is enjoyed with less interruption.

The soil consists of a thin layer of black or brown mould, composed of decayed vegetables, superimposed upon a light loam, occasionally of a sandy, and at other times of a clayey character. This extends about one foot downwards, and then a stiff clay, resting upon sand-stone, predominates. The latter rock is the base of the island, and it appears to extend under the bed of Northumberland Strait, into the contiguous islands, and also into the continent. A solitary block of granite occasionally presents itself; but neither limestone, gypsum, nor coal, have been discovered, although their presence was to have been expected from the occurrence of the sandstone formation. Iron has not yet been found, although the soil and the springs are impregnated with it. Red clay, of a superior quality, for bricks, abounds in all parts; and white clay, for potters' use, is found in limited quantities. The soil is fertile, and its quality can be readily ascertained by the nature of the wood which grows upon it; the richest being that where the maple, beech, black birch, and a mixture of other trees, grow; and the less fertile being that where the varieties of the fir tribe are most abundant. There are some unproductive bogs, swamps, and other tracts called barrens; but they bear but a small proportion to the whole surface of the island, and may, by judicious management, be brought under cultivation. The marshes, which are overflowed by the tide, rear a strong, nutritious grass, and, when dyked, yield heavy crops of wheat or hay. Those swamps also which have been drained form excellent meadows. A very considerable proportion of the island must have formerly been covered with pine forests, and some tracts, from which these have disappeared, partake of the character of barrens. Many of these plantations of wood have been destroyed by fires, which have at different periods raged over the island; and in these places white birches, spruce-firs, poplars, and wild cherry-trees, have sprung up. The poplars grow to an immense size, and are very plentiful. There are many other kinds of trees besides, such as beech, maple, dog-wood, alder, Indian pear tree; and most of the shrubs, wild fruits, herbs, and grasses, common to other parts of British North America. Sarsaparilla, ginseng, and probably many other medicinal plants, are plentiful in all parts of the island. Amongst the wild fruits, rasp-berries, straw-berries, cran-berries, which are very large, blue-berries, and whortle-berries, are exceedingly abundant.

Amongst the quadrupeds native to the island may be mentioned bears, once very numerous and destructive, but now much reduced; loup-cerviers, a deadly enemy of sheep; foxes and hares, which are both numerous; otters, martens, and musk-rats, now rarely met with, from having been long hunted for their skins; varieties of the squirrel in great abundance; and a few weasels and ermines. During spring, summer, and autumn, seals frequent the shores; and walrusses were at one time annual visitants, but they have now entirely disappeared. Partridges and wild pigeons are plentiful, and, as well as hares, are free for any person to kill, no game-laws existing. In spring and autumn, wild geese, ducks, and other water-fowl, are abundant. The reptiles and insects do not require particular notice. The rivers abound with excellent fish, such as trout, eel, mackerel, flounders, oysters, lobsters, the two latter being very large and very fine; and the coast with cod-fish and herrings in great abundance.

Prince Edward Island is essentially an agricultural colony, for which its climate, soil, and the configuration of its surface, admirably adapt it. All kinds of grain and vegetables raised in England arrive at perfection. Crop after crop of wheat springs up without manuring; the barley is excellent, and the oats much superior to any other of American growth. The potatoes and turnips cannot be anywhere excelled in quality, and peas and beans are equally good. Cabbage, carrots, parsnips, and, indeed, all culinary vegetables, thrive as well here as in English gardens. Various fruits are also cultivated, such as cherries, plums, damsons, and the like. Flax, of excellent quality, is raised and wrought into fabrics by private individuals. Hemp grows, but not to such perfection as in other places. The climate is particularly favourable to sheep, and they are exempt from those diseases common to the animal in this country. Black cattle are good, but small; swine thrive well, as also do horses and milk-cows. The breed of useful animals generally has been much improved of late years; and agriculture, by the fostering care of the governor, has recently made decided advances. Such being the natural resources and advantages of this colony, it appears to be admirably adapted for industrious emigrants with small capitals. Before adverting to the trade of the island, it will be necessary to speak of the principal settlements, and its division into three counties, viz. Queen's, King's, and Prince's Counties. These are again divided into parishes, the whole being subdivided into sixty-seven townships, containing about 20,000 acres each. The ground for a town, containing about 400 building lots, with the same number of pasture lots, are reserved in each county. These are, George Town in King's County, Charlotte Town in Queen's County, and Prince Town in Prince's County.

Queen's County contains five parishes, namely, Grenville, Charlotte, Bedford, Hillsborough, and St John's, and comprehends an area of 486,400 acres in the centre of the island. The north coast of this county possesses few harbours, except for smaller vessels; but it is extremely picturesque. On the south shore is Hillsborough Bay, at the bottom of which, and at the confluence of the three rivers Hillsborough, York, and Elliott, Charlotte Town, the capital of the island, and the seat of government, is situated. Its harbour is considered as one of the best and most secure in the Gulf of St Lawrence, though not more than half a mile wide at the entrance. Within this point it widens into a spacious basin, and then branches into three beautiful and navigable rivers. The harbour is protected by several batteries, and it could easily be put into such a state of defence as to secure the town from any attack from the seaward. The town is advantageously situated on ground which rises gradually to a moderate height above the level of the sea. It is regularly laid out, the streets being broad, and intersecting each other at right angles, five or six vacancies being left for squares. There are about three hundred and fifty dwelling-houses, many of them handsomely finished. The public buildings are, the court-house, in which the court of chancery, as well as the court of judicature, are held, and in which the legislative assembly likewise sit; the Episcopal church, the new Scotch church, and the Catholic and the Methodist chapels. The barracks are pleasantly situated near the water, and a neat parade or square occupies the space between those of the officers and privates. On the west side of the harbour lies the Fort or Warren Farm, the most beautiful situation on the island. No place could have been more judiciously selected as a site for the metropolis, than that which has been chosen for Charlotte Town. It is situated almost in the centre of the county, and of easy access, either by water, or by the different roads leading to it from the various other settlements. Indeed there is a maritime communication with a considerable portion of the island by means of the three rivers near the confluence of which it stands. The population amounts to about 3400. Twenty miles west of Charlotte Town, and nearly opposite to *Bai de Verts*, or Green Bay, in Nova Scotia, stands Tryon village, one of the most populous and pleasant places in the island. A serpentine river winds through it, on the banks of which are well-cultivated farms. The tide flows up about two miles; but, from a dangerous bar at its mouth, the harbour will only admit small vessels. On the north coast of this county is New London, in the district of Grenville Bay. The harbour of New London, though safe and convenient, will not admit vessels drawing more than twelve feet of water. The bar is sheltered during north-westerly winds by Cape Tryon, three miles to the north. The lands on the west side of this harbour have long been cultivated; and there was formerly an extensive fishing establishment erected here, but circumstances occurred to interrupt its prosperity. Harrington, or Grand Rustico Bay, has two entrances, and a harbour for small brigs and schooners. Here are two villages inhabited by Acadian French. The surrounding parts of the bay have been populously settled, chiefly by emigrants from Scotland. To the east of Grand Rustico, are Brackly, and Little Rustico, or Stanhope Cove, esteemed two of the finest settlements on the island. Still further east is Bedford, or Tracady Bay, at which there is a small harbour for schooners and small brigs. On the opposite side of the island is Belfast district, which includes the villages of Great and Little Belfast, Orwell, and Point Prince, together with various settlements. The soil here is excellent, and heavy crops are raised, the surplus of which is exported.

King's County, on the east side of the island, is divided into four parishes, viz. East, St Patrick, St George's, and St Andrew's, the whole comprising 412,000 acres. The first, as its name signifies, occupies the whole eastern point of the island, and is destitute of a harbour on its north shore, which is called the District of the Capes. The inhabitants are principally from the west of Scotland and the Hebrides, and they have chiefly applied themselves to agriculture. Owing to the abundant supplies of sea-weed which they possess, they manure the land well, and raise valuable crops, particularly of barley and wheat. Colville, Rollo, Fortune, and Broughton Bays, are small harbours with thriving settlements. St Patrick's parish has a good bay for small vessels on the north shore, called St Peter's, about nine miles long. The settlements on each side are in a flourishing and rapidly improving condition. St Andrew's parish has Murray Harbour and river in it. The former is well sheltered, but of difficult access. Ship-building is carried on here to some extent, and the surrounding country is rapidly improving. George Town, or Three Rivers, is situated in the parish of St George's, on the south-east part of the island. It possesses an excellent and safe harbour, at the junction of three fine rivers, and is well calculated for being the centre of any trade carried on within the Gulf of St Lawrence. Excellent fishing-grounds lie in its vicinity; and at certain seasons of the year herrings enter it in large shoals. The contiguous settlements are rapidly improving, the settlers turning their attention more to agriculture than formerly. Ship-building is carried on here, and a considerable quantity of timber has been exported within the last five-and-twenty years.

Prince's County contains five parishes, namely, North, Egmont, Halifax, Richmond, and St David's, and comprises an area of 467,000 acres. This county possesses several very fine harbours, particularly on the north side, that of Richmond Bay being the largest. This bay is ten miles in depth and nine miles in breadth; and although the centre part is unsheltered, there are several inlets perfectly safe from all winds, with from three to four fathoms of good anchorage.

Six beautiful islands lie within or across the bay, three of which have an area of 500 acres of good land. Lennox Island is the principal rendezvous of the Micmac Indians, once a powerful people, but, like the other aboriginal tribes of the west, now reduced to a mere handful by the arts and the arms of their white subjugators. They profess the Roman Catholic faith, and have here a burying-ground and chapel, where they assemble for a few weeks in summer. A number of townships abut on Richmond Bay, which has a highly advantageous water communication along the coast. It is well situated for cod and herring fisheries, and has afforded several cargoes of timber, as well as vessels built upon the spot, for the English market. The settlers here are principally Scotch, and are, generally speaking, a moral and orderly class of people. To the west of Richmond Bay is Holland Harbour, or Cascumpec, a safe and convenient place of anchorage. The lands around it are well adapted for agriculture; and this place also, by its advantageous situation, is well calculated for extensive fishing establishments. It is the most convenient port in the island for loading timber, where there is a very large quantity; it has also a saw-mill for cutting plank or board.

The population consists of Acadian French and some English families. From Holland Bay to the north-west point (in 47° 7′ north latitude) of the island, a distance of twenty-four miles, the coast is low and sandy, as is likewise the case from North Cape, down towards the West Cape, on the south coast, which forms the western entrance of Egmont Bay. This bay is sixteen miles broad, from the west point to Cape Egmont, and about ten deep. There is no harbour for large vessels within it, and it is by no means very inviting for strange vessels. The inhabitants in this part are chiefly Acadian French, who live in three small thriving villages on the east side of the bay. Farther to the east lies Halifax, or Bedeque Bay, which has a well-sheltered harbour. The shores are populously settled, and there are two or three ship-building establishments here.

When this island was in possession of the French, little commerce was carried on by the inhabitants; but when it came into the hands of the British, a small trade commenced in the articles of fish, oil, sea-cow skins, and seal-skins, which were exported to various parts of the North American continent. Since that period the trade has very materially increased. The following tables show the present state of the commercial and shipping interests of the island.

Vessels which have cleared Inwards and Outwards during the Years 1833 *and* 1834.

There is also a respectable trade in ship-building carried on in the colony. During the year 1833 there were thirty-two vessels launched and registered, having in the aggregate a tonnage of 4006. The number of vessels

John's, St. employed in the foreign and coasting trade belonging to the island in the same year was, foreign, five vessels, of 1169 tons burden, carrying forty-five men; coasting, 124 vessels, of 6346 tons burden, carrying 359 men. During the year ending December 1832, there were transferred from the island to other ports, thirty-two vessels, of 3202 tons burden in the aggregate. As the best fishing banks within the Gulf of St Lawrence are situated in the neighbourhood of this island, it is surprising that fisheries have not been more attended to. The herring fishery is the most important; immense shoals of these fish arrive on the coast early in spring, and can be taken in any quantity. Cod, mackerel, and other fish, may likewise be caught in abundance. In short, were more attention paid to the fisheries, they would add much to the value of property on the island. Agriculture, however, is not neglected, as will be seen by the following table, showing the quantity of

Goods exported in the Year ending 5th January 1833.

Articles Exported.	Great Britain.	British West Indies.	British North American Colonies.	Total Sterling.

The total amount of imports during the same year was L.70,068. The items were severally thus in the return:—

Brandy	L.443
Cordage	2,189
Dry goods, consisting of bales, cases, casks, trunks, boxes, and bundles	19,423
Nails	1,248
Molasses	1,517
Sail-cloth	1,123
Salt	734
Stationery	181
Soap	659
Sugar	2,164
Rum	8,355
Tea	4,894
Tobacco	1,369
Wine	966
Iron	685
Sundries	24,109

The returns for 1834 show a decided increase in trade, especially that which is dependent upon the cultivation of the soil. But of course the commerce of the island is as yet in its infancy. The following is a statistical view of the island, according to a return made under the authority of the act Will. IV. cap. 7, A. D. 1834, viz.

Townships	67
Acres of land occupied	382,301$\frac{3}{4}$
Acres of improved land ditto	89,757$\frac{1}{2}$
Cows owned	13,185
Oxen ditto	3,267
Other kinds of neat cattle	12,624
Horses	5,866
Sheep	48,076
Hogs	19,864
Bushels of wheat	121,032$\frac{1}{2}$
barley	37,300$\frac{1}{2}$
oats	246,049
potatoes	1,208,766
Grist mills	44
Saw mills	29

The total annual product of property has been estimated at the sum of L.1,146,336; the total moveable property at L.2,056,342; and the total immoveable property at L.1,305,000.

The constitution of this island, like that of the other islands in this quarter, is similar to the government of Britain, and in all civil matters is independent of any jurisdiction in America. The king is represented by a lieutenant-governor, who is also chancellor of the court of chancery. There is a council, consisting generally of twelve members elected by the king's mandamus, and which acts in an executive as well as legislative capacity; and a house of assembly of eighteen members elected by the people, and who manage their affairs after the manner of the British House of Commons. The chief-justice and attorney-general are appointed by the king, and the local government annually nominate the high sheriff. All criminal and civil matters of importance are tried in the supreme court of judicature, by a jury of twelve men. Magistrates and justices of peace take cognizance of smaller matters. The laws by which justice and good government are dispensed and secured are the same as those of England.

In financial matters the island is thus situated. When the soil was originally granted by government to various proprietors, the conditions of the settlement were, that a certain sum should be paid as quit-rent, amounting on an average to about four shillings and sixpence for each hundred acres. But this sum not being regularly paid, government agreed to accept of a composition; and this arrangement, by freeing the land from heavy claims, imparted a new stimulus to the island. In 1833 it was agreed upon by the house of assembly to address his majesty, offering to provide the whole civil expenses of the island, and asking in return that the crown would resign its claim to the quit-rents, and accept of a substitute of 4s. 6d. for every hundred acres in a township. At the same time it was stipulated that a civil list should be granted to the crown, so as to render the governor, judge, and other functionaries, independent of the annual votes of the house. The fate of this proposal is as yet undecided. St John's is one of those colonial islands which, from their native resources not having been sufficiently called forth, is at present of equivocal value to the mother country, in as far as revenue is concerned. The revenue has not always kept pace with the expenditure, as in 1833, when the former amounted to L.7684, and the latter to L.13,759; yet the deficit is to be accounted for by additional outlays for erecting public edifices, and for other useful or necessary purposes. Besides, there was a considerable balance, the remainder of former years; and an issue of treasury notes was made to meet the exigency, a redemption of these being anticipated from the new act levying an assessment upon land. Various causes have contributed to occasion a reduction in the amount of impost duty, such as the failure of crops, and the advanced prices of foreign articles; but such interruptions to prosperity are not likely to remain permanent. With respect to the monetary system, the weights and measures are the same as in England. The dollar is estimated at four shillings and sixpence, and thus becomes five shillings currency; the guinea is L.1. 3s. 4d.; and the other coins are in proportion. The paper currency at present in circulation is supposed to be about L.20,000. There is no banking establishment in the island, which is a material drawback to its prosperity.

The established religion of the colony is the Episcopalian, but the members of the church of Scotland and of that of Rome are supposed to be the most numerous. There are several missionary establishments, and the inhabitants generally are very much awake to the interests of religion, as is shown by the efforts which they have made for its dissemination, as well as that of its powerful auxiliary, education. There is at Charlotte Town a very respectable grammar-school, another on the Madras system, and there are others in most of the settlements for elementary instruction, government devoting a sum for their support. In all, there are seventy-four schools, attended by 2276 scholars. There are two well-conducted newspapers, one of which is published in Charlotte Town, where there is also a public subscription-library on a respectable footing.

We have no data by which to form a correct estimate of the progressive increase of the population. When taken from the French, the island, as we have seen, was supposed to contain about 6000 Acadians. By the census of 1833, the males were in number 15,129, and the females 13,795, making a total population of 28,925; which is an increase since 1827 of 8274. Natives of Scotland constitute more than one half of the whole population; those from the Hebrides are best suited to the island. The Acadian French are estimated at about 5000; but of the Micmac or native Indians, once so numerous, there remain probably not more than thirty families on the island.

JOHN'S, St, one of the Virgin Islands in the West Indies, belonging to Denmark. It is five miles in length by one in breadth, and is situated about thirty-six miles to the east of Porto Rico, and six miles south of the island of St Thomas. It is well watered, and possesses an excellent harbour; but the land in general is of little value, and the exports are trifling. It contains a population of 2430, of whom only 180 are whites. Long. 64. 32. W. Lat. 18. 7. N.

JOHNSON, or Jonson, Ben, one of the most distinguished dramatic poets of the Elizabethan age, whether we consider the number or the merit of his productions. He was born at Westminster in 1574, and was educated at the public school there, under the great Camden. He was descended from a Scottish family; but as his father, who had lost his estate under Queen Mary, died before our poet was born, and his mother married a brick-layer for her second husband, Ben was taken from school to work at his father-in-law's trade. Not being captivated with this employment, however, he went into the Low Countries, and distinguished himself in a military capacity. On his return to England, he entered himself at St John's College, Cambridge; and having killed a person in a duel, he was condemned, and narrowly escaped execution. After this he turned actor; and Shakspeare is said to have first introduced him to the world, by recommending a play of his to the stage, after it had been rejected. His Alchymist gained him such reputation, that in 1619 he was, at the death of Mr Daniel, made poet-laureate to King James I. and master of arts at Oxford. As we do not find Jonson's economical virtues anywhere recorded, it is the less to be wondered that, after this, we should find him petitioning King Charles, on his accession, to enlarge his father's allowance of a hundred merks into pounds; and soon afterwards we learn that, being very poor and sick, he lodged in an obscure alley. On this occasion it was that Charles, having been moved in his favour, sent him ten guineas, upon which Ben remarked, "His majesty sent me ten guineas because I am poor, and live in an alley; go and tell him that his soul lives in an alley." He died in August 1637, at the age of sixty-three, and was buried in Westminster Abbey. The most complete edition of his works was that printed in 1756, in 7 vols. 8vo.

Johnson, *Dr Samuel*, one of the brightest ornaments of the eighteenth century, was born in the city of Litchfield, in Staffordshire, on the 18th of September 1709. His father Michael was a bookseller, and must have had some reputation in the city, as he more than once held the office of chief magistrate. By what casuistry he reconciled his conscience to the oaths required to be taken by all who occupy such stations cannot now be known; but it is certain that he was zealously attached to the exiled family of Stuart, and instilled the same principles into the youthful mind of his son. So earnest was he in this, and at so early a period did he commence it, that when Dr Sacheverel, in his memorable tour through England, came to Litchfield, Mr Johnson carried his son, not then quite three years of age, to the cathedral, and placed him on his shoulders, that he might see as well as hear the famous preacher.

But political prejudices were not the only doubtful qualities which young Sam inherited from his father. He derived from the same source a morbid melancholy, which, though it neither depressed his imagination, nor clouded his perceptions, filled him with dreadful apprehensions of insanity, and rendered him wretched through life. From his nurse he contracted the scrofula or king's evil, which made its appearance at a very early period, disfigured a face naturally well-formed, and deprived him of the sight of one of his eyes.

When he had arrived at a proper age for receiving grammatical instruction, he was placed in the free school of Litchfield, of which Mr Hunter was then master; a man whom his illustrious pupil thought "very severe, and wrongheadedly severe," because he would beat a boy for not answering questions which the latter could not expect to be asked of him. He was, however, a skilful teacher; and Johnson, when he stood in the very front of learning, was sensible how much he owed to him; for upon being asked how he had acquired so accurate a knowledge of the Latin tongue, he replied, "My master beat me very well; without that, Sir, I should have done nothing."

At the age of fifteen, Johnson was removed from Litchfield to the school of Stourbridge in Worcestershire, at which he remained little more than a year, and then returned home, where he staid two years without any settled plan of life or any regular course of study. But he read a great deal in a desultory manner, as chance threw books in his way, and as inclination directed him through them; so that when, in his nineteenth year, he was entered a commoner of Pembroke College, Oxford, his mind was stored with a variety of such knowledge as is not often acquired in universities, where boys seldom read any books but those which are put into their hands by their tutors. He had given very early proofs of his poetical genius, both in his school exercises and in other occasional compositions; but what is perhaps more remarkable, as evincing that he must have thought a good deal on a subject on which other boys of that age seldom think at all, he had, before he was fourteen, entertained doubts of the truth of revelation. From the melancholy of his temper, these naturally preyed upon his spirits, and gave him great uneasiness; but they were happily removed by a proper course of reading; for his studies being honest, ended in conviction. He found that religion was true; and what he had learned by inquiry, he ever afterwards endeavoured to teach to mankind.

Concerning his residence at the university, and the means by which he was there supported, his two principal biographers contradict each other; and hence on these points it is impossible to write with certainty. According to Sir John Hawkins, the time of his continuance at Oxford is divisible into two periods; but Mr Boswell represents it as only one period, with the usual interval of a long vacation. Sir John says that he was supported at college by Mr Andrew Corbet, in quality of assistant to his son. But Mr Boswell assures us, that though he was promised pecuniary aid by Mr Corbet, that promise was not in any degree fulfilled. With regard to the knight's account of this transaction, it seems to be inconsistent with itself. He says, that the two young men were entered in Pembroke on the same day; that Corbet continued in the college two years; but that Johnson was driven home in little more than one year, because, by the removal of Corbet, he was deprived of his pension. A story of which one part contradicts the other cannot be wholly true. Sir John adds, that "meeting with another source, the bounty, as is supposed, of some one or more of the members of the cathedral of Litchfield, he returned to college, and made up the whole of his residence in the university about three years." Mr Boswell has told us nothing more than that Johnson, though his father was unable to support him, continued three years in college, and that he was then driven from it by extreme poverty.

These gentlemen differ likewise in their accounts of Johnson's tutors. Sir John Hawkins says that he had two, Mr Jordan and Dr Adams. Mr Boswell affirms that Dr Adams could not be his tutor, because Jordan did not quit the college till 1731, the year in the autumn of which Johnson himself was compelled to leave Oxford. Yet the same author represents Dr Adams as saying, "I was Johnson's nominal tutor, but he was above my mark;" a speech of which it is not easy to discover the meaning, if it formed no part of Johnson's duty to attend upon Adams's prelections. In most colleges we believe there are two tutors in different departments of education; and therefore it is not improbable that Jordan and Adams may have been at the same time tutors to Johnson, the one in languages, and the other in science. Jordan was a man of such mean abilities, that though his pupil loved him for the goodness of his heart, he would often risk the payment of a small fine rather than attend his prelections; nor was he studious to conceal the reason of his absence. Upon occasion of one such imposition, Johnson is reported to have said, "Sir, you have sconced me twopence for non-attendance at a lecture not worth a penny." For some transgression or absence his tutor imposed upon him, as a Christmas exercise, the task of translating into Latin verse Pope's *Messiah*. This Johnson performed, and on his translation being shown to the author of the original, the latter, after perusal, returned it with this observation, "The writer of this poem will leave it a question for posterity, whether his or mine be the original." The particular course of his reading whilst in college, and during the vacation which he passed at home, cannot be traced. That at this period he read much, we have his own evidence in what he afterwards told the king; but his mode of study was never regular, and at all times he thought more than he read. He informed Mr Boswell, that what he read solidly at Oxford was Greek, and that the study of which he was fondest was that of metaphysics.

In the year 1731 Johnson left the university without a degree; and as his father, who died in the month of December of that year, had suffered great misfortunes in trade, he was driven out as a commoner of nature, and excluded from the regular modes of profit and prosperity. Having therefore not only a profession, but the means of subsistence, to seek, he, in the month of March 1732, accepted an invitation to the office of under-master of a free school at Market-Bosworth, in Leicestershire; but not knowing, as he said, whether it was more disagreeable for him to teach or for the boys to learn the rules of grammar, and being likewise disgusted at the treatment which he had received from the patron of the school, he in a few months relinquished a situation which he ever afterwards recollected with horror. Being thus again without any fixed employment, and with very little money in his pocket, he translated Lobo's Voyage to Abyssinia, for the trifling sum, it is said, of five guineas, which he received from a bookseller in Birmingham. This was the first attempt which he made to procure pecuniary assistance by means of his pen; and it must have held forth very little encouragement to his commencing author by profession.

In 1735, being then in his twenty-sixth year, he married Mrs Porter, the widow of a mercer in Birmingham; a woman whose age was almost double his, whose external form had never been captivating, and whose fortune amounted to scarcely L.800. That she had a superiority of understanding and talents, is extremely probable, both because she certainly inspired him with a more than ordinary passion, and because she was herself so delighted with the charms of his conversation as to overlook his external disadvantages, which were many and great. He now set up a private academy, for which purpose he had hired a large house, well situated, near his native city; but his name having then nothing of that celebrity which afterwards commanded the attention and respect of the world, this undertaking did not succeed. The only pupils who are known to have been placed under his care, were the celebrated David Garrick, his brother George Garrick, and a young gentleman of fortune, of the name of Offely. He kept this academy only a year and a half; and it was during the period in question that he constructed the plan and wrote the greater part of his tragedy of *Irene*.

The respectable character of his parents, and his own merit, had secured him a kind reception in the best families at Litchfield; and he was particularly distinguished by Mr Walmsley, registrar of the ecclesiastical court, a man of great worth, and of extensive and various erudition. That gentleman, upon hearing part of Irene read, thought so highly of Johnson's abilities as a dramatic writer, that he advised him by all means to complete the tragedy and produce it on the stage. To men of genius the stage holds forth temptations almost irresistible. The profits arising from a tragedy, including the representation and printing of it, and the connections which it sometimes enables the author to form, were in Johnson's imagination inestimable. Flattered, it may be supposed, with these hopes, he, in the year 1737, set out for London, with his pupil David Garrick, leaving Mrs Johnson to take care of the house and the wreck of her fortune. The two adventurers carried with them from Mr Walmsley an earnest recommendation to the Reverend Mr Colson, then master of an academy, and afterwards Lucasian professor of mathematics in the university of Cambridge; but from that gentleman it does not appear that Johnson ever found either protection or encouragement.

How he spent his time upon his arrival in London is not particularly known. His tragedy was refused by the managers of the day; and for some years the Gentleman's Magazine seems to have been his principal resource for employment and support. To enumerate his various communications to that miscellany would be equally tedious and unnecessary. It is sufficient to say, that his connection with Cave the proprietor became very close; that he wrote prefaces, essays, reviews of books, and poems; and that he was occasionally employed in correcting the papers written by other correspondents. When the complaints of the nation against the administration of Sir Robert Walpole became loud, and on the 13th of February 1740 a motion was made to remove him from his majesty's counsels for ever, Johnson was pitched upon by Cave to write what was in the Magazine entitled "Debates in the Senate of Lilliput," but was understood to be the speeches of the most eminent members in both houses of parliament. These orations, which induced Voltaire to compare British with ancient eloquence, were hastily sketched by Johnson whilst he was not yet thirty-two years of age, but little acquainted with life, and struggling, not for distinction, but for existence. Perhaps in none of his writings has he given a more conspicuous proof of a mind prompt and vigorous almost beyond conception. They were composed from scanty notes taken by illiterate persons employed to attend in both houses; and sometimes he had nothing communicated to him but the names of the several speakers, and the part which they took in the debate.

His separate publications which at this time attracted the greatest notice were, *London*, a poem in imitation of Juvenal's third Satire; *Marmor Norfolciense*, or an Essay on an ancient prophetical Inscription in Monkish Rhyme, discovered near Lynne, in Norfolk; and a complete Vindication of the Licensers of the Stage from the malicious and scandalous aspersions of Mr Brook, author of Gustavus Vasa. The poem, which was published in 1738, by Dodsley, is universally known and admired as the most spirited instance in the English language of ancient sentiments adapted to modern topics. Pope, who then filled the poetical throne without a rival, being informed that the author's name was Johnson, and that he was an obscure person, replied, "He will soon be *deterré*." The two pamphlets, which were published in 1739, are filled with keen satire on the government. Sir John Hawkins has thought fit to declare that they display neither learning nor wit; but Pope was of a different opinion; for in a note of his preserved by Mr Boswell, he says, that "the whole of the Norfolk prophecy is very humorous."

Mrs Johnson, who went to London soon after her husband, now lived sometimes in one place and sometimes in another, sometimes in the city and sometimes at Greenwich; but Johnson himself was oftener to be found at St John's Gate, where the Gentleman's Magazine was published, than in his own lodgings. It was there that he became acquainted with Savage, with whom he was induced, probably by the similarity of their circumstances, to contract a very close friendship; and such were their extreme necessities, that they often wandered during whole nights in the street, for want of money to procure them a lodging. In one of these nocturnal rambles, when their distress was almost incredible, so far were they from being depressed by their situation, that, in high spirits and brimful of patriotism, they traversed St James's Square for several hours, inveighed against the minister, and, as Johnson said in ridicule of himself, his companion, and all such pennyless patriots, "resolved that *they* would stand by their country." In 1744, he published the life of his unfortunate companion; a work which, had he never written any thing else, would have placed him very high in the rank of authors. His narrative is remarkably smooth and well disposed; his observations are just, and his reflections disclose the inmost recesses of the human heart. But, to say nothing of the pretended birth of Savage, whom Mr Boswell considered as an impostor, the moral character of this person was undoubtedly unworthy of such a biographer; and it is not easy to discover any thing either in his intellectual or poetical qualifications which could reasonably have entitled him to the prominent place amongst English poets which the partiality of Johnson has assigned to his companion in misfortune.

In 1749, when Drury-lane theatre was opened under the management of Garrick, Johnson wrote for the occasion a prologue, which, for just dramatic criticism, as well as poetical excellence, is confessedly unrivalled. This year is also distinguished in his life as the epoch when his arduous and important work, the *Dictionary of the English Language*, was announced to the world by the publication of its plan or prospectus, addressed to the Earl of Chesterfield. From that nobleman Johnson was certainly led to expect patronage and encouragement; and it seems equally certain that his lordship expected, when the book made its appearance, to be honoured with the dedication. But the expectations of both were disappointed. Lord Chesterfield, after once or twice seeing the lexicographer, suffered him to be repulsed from his door; but afterwards thinking to conciliate him when the work was upon the eve of publication, he wrote two papers in *The World*, warmly recommending it to the public. This artifice was seen through; and Johnson, in very polite language, rejected his lordship's advances, letting him know that he was unwilling the public should consider him as owing that to a patron which Providence had enabled him to do for himself. This great and laborious work its author expected to complete in three years; but he was certainly employed upon it seven years; for we know that it was begun in 1747, and that the last sheet was sent to the press in the end of the year 1754. When we consider the nature of the undertaking, it is indeed astonishing that it was finished so soon, since it was written, as he says, "with little assistance of the learned, and without any patronage of the great; not in the soft obscurities of retirement, or under the shelter of academic bowers, but amidst inconvenience and distraction, in sickness and in sorrow." The sorrow to which he here alludes is probably that which he felt for the loss of his wife, who died in March 1752, and the loss of whom he continued to lament as long as he lived.

The Dictionary did not occupy his whole time; for whilst he was pushing it forward, he fitted his tragedy for the stage, wrote the lives of several eminent men for the Gentleman's Magazine, published an Imitation of the tenth Satire of Juvenal, entitled the Vanity of human Wishes, and began and finished *The Rambler*. This last work is so well known, that it is hardly necessary to say that it was a periodical paper, published twice a week, from the 20th of March 1750 to the 14th of March 1752 inclusive; but to convey some notion of the vigour and promptitude of the author's mind, it may not be improper to observe, that notwithstanding the severity of his other labours, all the assistance which he received did not amount to five papers; and that many of the most masterly of these essays were written on the spur of the occasion, and were never seen entire by the author till they returned to him from the press.

Soon after the Rambler was concluded, Dr Hawkesworth projected *The Adventurer*, upon a similar plan; and, by the assistance of friends, he was enabled to carry it on with almost equal merit. For a short time, indeed, it was the more popular work of the two; and the papers with the signature T, which are confessedly the most splendid in the whole collection, are now known to have been communicated by Johnson, who received for each the sum of two guineas. This was double the price for which he sold sermons to such clergymen as either would not or could not compose their own discourses; indeed he seems to have made a kind of trade of sermon-writing.

Though, during the time that he was employed on the Dictionary, he had exhausted more than the sum for which the booksellers had bargained as the price of the copy, yet, by means of the Rambler, Adventurer, sermons, and other productions of his pen, he now found himself in greater affluence than he had ever before been; and as the powers of his mind, distended by long and severe exercise, required relaxation to restore them to their proper tone, he appears to have done little or nothing from the close of the Adventurer till the year 1756, when he undertook the office of reviewer in the Literary Magazine. Of his reviews, by far the most valuable is that of Soame Jenyns's Free Inquiry into the Nature and Origin of Evil. Never were wit and metaphysical acuteness more closely united than in that criticism, which exposes the weakness and holds up to contempt the reasonings of those vain mortals who presumptuously attempt to grasp the scale of existence, and to form plans of conduct for the Creator of the universe. But the furnishing of magazines, reviews, and even newspapers, with literary intelligence, and authors of books with dedications and prefaces, was considered as an employment unworthy of Johnson. It was therefore proposed by the booksellers that he should give a new edition of the dramas of Shakspeare; a work which he had projected many years before, and of which he had published a specimen which was commended by Warburton. When one of his friends expressed a hope that this employment would furnish him with amusement, and add to his fame, he replied, "I look upon it as I did upon the Dictionary; it is all work; and my inducement to it is not love or desire of fame, but the want of money, which is the only motive to writing that I know of." He issued proposals, however, of considerable length, in which he showed that he knew perfectly what a variety of research such an undertaking required; but his indolence prevented him from pursuing it with diligence, and it was not published till many years afterwards.

On the 15th of April 1785, he began a new periodical paper entitled *The Idler*, which came out every Saturday, in a weekly newspaper called the Universal Chronicle, or Weekly Gazette, published by Newberry. Of these essays, which were continued till the 5th of April 1760, many were written as hastily as an ordinary letter; and one in particular, composed at Oxford, was begun only half an hour before the departure of the post which carried it to London. About this time he had the offer of a living, of which he might have rendered himself capable by entering into orders. It was a rectory, in a pleasant country, of such yearly value as would have been an object to one in much better circumstances; but, sensible, as is supposed, of the asperity of his temper, he declined it, saying, "I have not the requisites for the office, and I cannot in my conscience shear the flock which I am unable to feed."

In the month of January 1759, his mother died, at the advanced age of ninety; an event which deeply affected him, and gave birth to the forty-first paper in the Idler, in which he laments, that "the life which made his own life pleasant was at an end, and that the gate of death was shut upon his prospects." Soon afterwards he wrote his *Rasselas, Prince of Abyssinia*, that with the profits he might defray the expense of his mother's funeral, and pay some debts which she had left. He told a friend that he received for the copy L.100, and L.25 more when it came to a second edition; that he wrote it in the evenings of a week, sent it to the press in portions as it was written, and had never since read it.

Hitherto, notwithstanding his varions publications, he was poor, and obliged to provide by his labour for the wants of the day that was passing over him; but having been, early in 1762, represented to the king as a very learned and good man, without any certain provision, his majesty was pleased to grant him a pension, which Lord Bute, then first minister, assured him, "was not given for any thing which he was to do, but for what he had already done." But a fixed annuity of three hundred pounds, if it diminished his distress, increased his indolence; for as he constantly avowed that he had no other motive in writing than to gain money, as he had now what was abundantly sufficient for all his purposes, and as he delighted in conversation, and was visited and admired by the witty, the elegant, and the learned, very little of his time was passed in solitary study. Solitude was indeed his aversion; and, that he might avoid it as much as possible, Sir Joshua Reynolds and he, in 1764, instituted a club, which existed long without a name, but was afterwards known by the title of the Literary Club. It consisted of some of the most enlightened men of the age, who met at the Turk's Head in Gerard Street, Soho, one evening in every week, at seven, and till a late hour enjoyed "the feast of reason and the flow of soul."

In 1765, when Johnson was more than usually oppressed with constitutional melancholy, he was fortunately introduced into the family of Mr Thrale, one of the most eminent brewers in England, and member of parliament for the borough of Southwark; and it is but justice to acknowledge, that to the assistance which Mr and Mrs Thrale gave him, to the shelter which their house afforded him for sixteen or seventeen years, and to the pains which they took to soothe or repress his uneasy fancies, the public is probably indebted for some of the most masterly as well as the most popular works which he ever produced. At length, in the October of this year, he gave to the world his edition of Shakspeare, which is chiefly valuable for the preface, where the excellencies and defects of that immortal bard are displayed with a judgment which must please every man whose taste is not regulated by the standard of fashion or national prejudice, and where the question of the unities is discussed with an ability and force of reasoning which leaves nothing to be added or desired on the subject. In 1767 he was honoured by a private conversation with the king, in the library at the queen's house; and two years afterwards, upon the establishment of the Royal Academy of Painting and Sculpture, he was nominated professor of ancient literature; an office merely honorary, and conferred on him, as is supposed, at the recommendation of his friend the president.

In the variety of subjects on which he had hitherto exercised his pen, he had forborne, since the administration of Sir Robert Walpole, to meddle with the disputes of contending factions; but having seen with indignation the methods which, in the business of Mr Wilkes, were taken to work upon the populace, he published in 1770 a pamphlet, entitled *The False Alarm,* in which he asserts, and labours to prove by a variety of arguments founded on precedents, that the expulsion of a member of the House of Commons is equivalent to exclusion, and that no such calamity as the subversion of the constitution was to be feared from an act warranted by usage, and conformable to the law of parliament. Whatever may be thought of the principles maintained in this publication, it unquestionably contains much wit and argument, expressed in the author's best style of composition; and yet it is known to have been written between eight o'clock on Wednesday night and twelve o'clock on the Thursday night, when it was read to Mr Thrale upon his return from the House of Commons. In 1771 he published another political pamphlet, entitled *Thoughts on the Late Transactions respecting Falkland's Islands,* in which he attacked *Junius;* and he ever afterwards delighted himself with the thought of having vanquished that able writer, whom he certainly rivalled in nervous language and pointed ridicule.

In 1773, he, in company with Mr Boswell, visited some of the most considerable of the Hebrides or Western Islands of Scotland, and published an account of his journey, in a volume which abounds in extensive philosophical views of society, ingenious sentiments, and lively descriptions, but which offended many persons by the vehement attack which it contained on the authenticity of the poems attributed to Ossian. For the degree of offence that was taken, the book can hardly be thought to contain a sufficient reason; and if the antiquity or genuineness of these poems be yet doubted, this is owing more to the conduct of their editor than to the violence of Johnson. In 1774, the parliament being dissolved, he addressed to the electors of Great Britain a pamphlet, entitled *The Patriot;* of which the design was to guard them from imposition, and teach them to distinguish true from false patriotism. In 1775 he published *Taxation no Tyranny, in Answer to the Resolutions and Address of the American Congress.* In this performance his admirer Mr Boswell cannot, he says, perceive that ability of argument or felicity of expression for which on other occasions Johnson was remarkable. This seems a singular criticism. To the assumed principle upon which the reasoning of the pamphlet rests many have objected, and perhaps their objections are well founded; but if it be admitted that "the supreme power of every community has the right of requiring from all its subjects such contributions as are necessary to the public safety or public prosperity," it will be found a difficult task to break the chain of argument by which it is proved that the British parliament had a right to tax the Americans. As to the style of the pamphlet, the reader who adopts the maxim recorded in the *Journal of a Tour to the Hebrides,* that a controversialist "ought not to strike soft in battle," must acknowledge that it is uncommonly happy, and that the whole performance is one of the most brilliant as well as correct pieces of composition that ever fell from the pen of its author. These essays drew upon him numerous attacks, all of which he heartily despised; for though it has been supposed that a Letter addressed to Dr Samuel Johnson occasioned by his Political Publications, gave him great uneasiness, the contrary is manifest, from his having, after the appearance of that letter, collected them into a volume under the title of *Political Tracts by the Author of the Rambler.* In 1765 Trinity College, Dublin, had created him doctor of laws by diploma; and he now received the same honour from the University of Oxford, an honour with which, though he did not boast of it, he was highly gratified. In 1777 he was induced, by a case of an extraordinary nature, to exercise that humanity which in him was obedient to every call. Dr William Dodd, a clergyman, under sentence of death for the crime of forgery, found means to interest Johnson in his behalf, and procured from him two of the most energetic compositions ever written; the one being a petition from himself to the king, and the other a similar address from his wife to the queen. But these petitions failed of success. Lord Mansfield's opinion was unfavourable to Dodd, and the reverend forger underwent the last punishment of the law.

The principal booksellers in London having determined to publish a body of English poetry, Johnson was prevailed upon to write the lives of the poets, and give a character of the works of each. This task he undertook with alacrity, and upon the whole executed it in a manner worthy of his reputation. The work was published in ten small volumes, of which the first four appeared in 1778, and the others in 1781. Whilst the world in general was filled with admiration of the great powers of the man who at the age of seventy-two, and labouring under a complication of diseases, could produce a work which displays so much genius and learning, there were narrow circles in which prejudice and resentment were fostered, and whence attacks of different sorts issued against him. But these gave him not the smallest disturbance. When told of the feeble though shrill outcry that had been raised, he replied, "Sir, I considered myself as intrusted with a certain portion of truth. I have given my opinion sincerely; let them show where they think me wrong."

He had hardly begun to reap the laurels gained by this performance, when death deprived him of Mr Thrale, in whose house he had enjoyed the most comfortable hours of his life; but it abated not in Johnson that care for the interests of those whom his friend had left behind him, and whom he thought himself bound to cherish, in duty as one of the executors of his will, and in gratitude for the kindness he had experienced at his hands. On this account, his visits to Streatham, Mr Thrale's villa, were for some time after his death regularly made on Monday, and protracted till Saturday, as they had been during his life; but they soon became less frequent, and at length he studiously avoided the mention of the place or the family. Mrs Thrale, who ere long changed her name for that of Mrs Piozzi, says, indeed, that "it grew extremely perplexing and difficult to live in the house with him when the master of it was no more, because his dislikes grew capricious, and he could scarce bear to have any body come to the house whom it was absolutely necessary for her to see." The person whom she thought it most necessary for her to see may perhaps be guessed at without any extraordinary share of sagacity; and if these were the visits which Johnson could not bear, posterity, so far from thinking his dislikes capricious, though they may have been perplexing, would, if he had acted otherwise, have blamed him for the want of gratitude to the friend whose "face for fifteen years had never been turned upon him but with respect or benignity."

About the middle of June 1783, his constitution sustained a severer shock than it had ever before experienced, from a stroke of the palsy, which was so sudden and so violent, that it awakened him out of a sound sleep, and rendered him for a short time speechless. As usual, he had recourse, under this affliction, to piety, which in him was constant, sincere, and fervent. He tried to repeat the Lord's prayer, first in English, then in Latin, and afterwards in Greek; but succeeded only in the last attempt, immediately after which he was again deprived of the power of articulation. From this alarming attack he in a short time recovered, but it left behind it presages of a dropsical affection; and he was soon afterwards seized with a spasmodic asthma of such violence that he was confined to the house in great pain, whilst his dropsy increased, notwithstanding all the efforts of the most eminent physicians. He had, however, such an interval of ease as enabled him, in the summer of 1784, to visit his friends at Oxford, Litchfield, and Ashbourne in Derbyshire. One day the Roman Catholic religion being introduced as the topic of conversation when he was in the house of Dr Adams, Johnson said, "If you join the Papists externally, they will not interrogate you strictly as to your belief in their tenets. No reasoning Papist believes every article of their faith. There is one side on which a good man might be persuaded to embrace it. A good man of a timorous disposition, in great doubt of his acceptance with God, and pretty credulous, might be glad of a church where there are so many helps to go to heaven. I would be a Papist if I could. I have fear enough; but an obstinate rationality prevents me. I should never be a Papist unless on the near approach of death, of which I have very great terror." His constant dread of death was indeed so great, that it astonished all who had access to know the piety of his mind and the virtues of his life. Attempts have been made to account for it in various ways; but that probably is the true account which is given by an elegant and pious writer, in the *Olla Podrida*. "That he should not be conscious of the abilities with which Providence had blessed him was impossible. He felt his own powers; he felt what he was capable of having performed; and he saw how little, comparatively speaking, he had performed. Hence his apprehension on the near prospect of the account to be made, viewed through the medium of constitutional and morbid melancholy, which often excluded from his sight the bright beams of divine mercy." This, however, was the case only whilst death was approaching from a distance. From the time that he was certain it was near, all his fears were calmed; and he died on the 13th of December 1784, full of resignation strengthened by faith, and joyful in hope.

Dr Johnson was a man of herculean form of body, as well as of great powers of mind. His stature was tall, his limbs were large, his strength was more than common, and his activity in early life had been greater than such a form gave reason to expect; but he was subject to an infirmity of the convulsive kind, resembling the distemper called St Vitus's dance; and he had the seeds of so many diseases sown in his constitution, that a short time before his death he declared that he hardly remembered to have passed one day wholly free from pain. He possessed extraordinary powers of understanding, which were much cultivated by reading, and still more by meditation and reflection. His memory was retentive, his imagination vigorous, and his judgment penetrating. He read with great rapidity, retained with wonderful exactness what he so easily collected, and possessed the power of reducing to order and system the scattered hints on any subject which he had gathered from different books. It would not be safe to claim for him the highest place amongst his contemporaries in any single department of literature; but he brought more mind to every subject, and had a greater variety of knowledge ready for all occasions, than any other man that could easily be named. Though prone to superstition, he was in other respects so incredulous, that Hogarth observed, whilst Johnson firmly believed the Bible, he seemed determined to believe nothing but the Bible. Of the importance of religion he had a strong sense; his zeal for its interests was always awake, whilst profaneness of every kind was abashed in his presence. The same energy which he displayed in his literary productions, or even greater, was exhibited also in his conversation, which was various, striking, and instructive. Like the sage in Rasselas, he spoke, and attention watched his lips; he reasoned, and conviction closed his period. When he pleased, he could be the greatest sophist that ever contended in the lists of declamation; and perhaps no man ever equalled him in nervous and pointed repartees. His veracity, from the most trivial to the most solemn occasions, was strict even to severity. He scorned to embellish a story with fictitious circumstances; for what is not a representation of reality, he used to say, is not worthy of our attention. As his purse and his house were ever open to the indigent, so was his heart tender to those who wanted relief, and his soul susceptible of gratitude, and every kind impression. He had a roughness in his manner which subdued the saucy and terrified the meek; but it was only in his manner, for no man was more loved than Johnson by those who knew him; and his works will be read with admiration as long as the language in which they are written shall be understood.

JOHNSTON, Arthur, a very eminent Latin poet, was the fifth son of George Johnston of Caskieben, by Christian the daughter of Lord Forbes.[1] The father, who was possessed of extensive estates, had a numerous family, six sons and seven daughters having reached the age of maturity. Arthur was born at Caskieben in the county of Aberdeen in the year 1587, but the day of his birth is not mentioned. The first elements of classical learning he acquired at the neighbouring town of Kintore, and he afterwards became a student in Marischal College, Aberdeen. Caskieben, Kintore, Inverury, and Aberdeen are all commemorated in his poems. Whether he resided in the university long enough to take a degree in arts, we are not informed; but it is probable that he proceeded to the continent at a very early age, for he took the degree of M. D. at Padua on the 11th of June 1610. This university was long celebrated as a school of physic as well as law; and Benson supposes that it may have afforded him a favourable opportunity for the cultivation of his talents for Latin poetry.

In an elegy addressed to Wedderburn, he has supplied us with some information respecting his personal history.

Quas ego non terras, quæ non vagus æquora pressi,
  Hæc licet ingenio sint minus apta meo?
Bis mihi trajectæ vicinæ nubibus Alpes;
  Tybris et Eridani pota bis unda mihi est.
Præbuit hospitium bis binis Gallia lustris:
  Conjugis hæc titulum terra patrisque dedit.
Me Geta, me Batavus, me vidit Cimber et Anglus,
  Et quæ Teutonico terra sub axe riget.
Non tot Dulichius pater est erroribus actus,
  Dum peteret patrios per vada sæva lares.
Quinta Caledoniæ me rursus Olympias oræ
  Reddidit effætum, dissimilemque mei.
Numina jam decies et ter fecere parentem;
  Pignora sex superant, cætera turba fuit.
Bis mihi quæsivi, nec ab una gente, maritam:
  Bis conjunx, bis jam me reor esse senem.

From these verses we learn that he had twice crossed the

Alps, and had twice visited Rome; that he had travelled in Germany, the Netherlands, Denmark, and England; that he had resided twenty years in France, and had there become a husband and a father; and that two wives, who were of different nations, had born him thirteen children. The fifth Olympiad restored him to his native country. The term *Olympias* more properly denotes a period of four years, but here, as in other instances, it is evidently employed to denote a period of five: for it appears that he had spent twenty years in France, and he mentions his peregrinations in other countries. He must therefore have returned to Scotland before the completion of the twenty-fifth year. Sir Thomas Urquhart has stated that "before he was full three and twenty yeers of age, he was laureated poet at Paris, and that most deservedly."[1] He spent a considerable time in the university of Sedan,[2] where his very learned countryman Andrew Melville became a professor of divinity in the year 1611. With him and the other divinity professor, Daniel Tilenus, he appears to have lived on intimate terms; and the names of both are familiar to the readers of his poems. As he resided so long in France, it has been supposed that he there followed the profession of a physician. The names of his two wives are not mentioned; but one of them is described as a woman of honourable birth. The one he married in France, and the other belonged to the vicinity of Mechlin, a city in Brabant. In an elegy addressed "Ad Senatum Mechliniensem, adversus Hamptæum militem Bulloniensem," he speaks of her in the subsequent terms:

> Quid memorem lachrymas quas nunc, absente marito,
> Fundit in ignota flebilis uxor humo?
> Per patriam rogat illa suam, patriosque penates,
> Quos dirimit vestra quartus ab urbe lapis.

He appears to have left her in Britain, and to have repaired to Mechlin for the purpose of prosecuting against this rude soldier some claim which probably accrued to him by marriage. After many delays and much anxiety, he obtained a decision in his favour; and his feelings during the progress of this litigation are elegantly recorded in various poems.

Before his return to Britain, he had acquired considerable reputation by the exercise of his poetical talents. Dr Eglisham, another Scottish physician, had endeavoured to detract from the reputation of Buchanan, by publishing an acrimonious criticism upon his version of the hundred and fourth psalm; but in one respect he was a very fair critic, for he at the same time exhibited in contrast a version of his own.[3] Instead of attempting a serious refutation of his animadversions, Johnston wrote a very bitter, though a very elegant satire, in which he treated his case as one of decided insanity. This poem was speedily published under the title of "Consilium Collegii Medici Parisiensis de Mania G. Eglishemii, quam prodidit scripto, cui titulus Duellum Poeticum," &c. Edinburgi, excudebat Andreas Hart, 1619, 8vo. A Paris edition of the same date is likewise mentioned. This publication is anonymous; and when he inserted the poem in the collection of his *Parerga*, he suppressed the name of Eglisham, and substituted that of Hypermorus Medicaster. Not satisfied with inflicting so signal a castigation, he assailed the unfortunate rival of Buchanan in another poem, entitled *Onopordus Furens*. Paris. 1620, 8vo. During the same year, Dr Barclay, another learned physician, refuted the captious criticisms of Eglisham, and exposed the puerility of the version to which the author's vanity had assigned so conspicuous a place.

Dr Johnston's next publication bears the title of "Elegia in Obitum Jacobi Pacifici, Magnæ Britanniæ, Franciæ, et Hiberniæ Regis, Fideique Defensoris." Lond. 1625, 4to. Lauder has stated that he returned to his native country in 1632, and continued for some years to reside at Aberdeen; but Dempster,[4] who died in 1625, mentions, though with some degree of hesitation, that he had already returned at the period when he himself wrote. Benson conjectures that he was appointed physician to the king in the year 1633, but this conjecture is refuted by the title-page of one of his publications. "Elegiæ duæ; una ad Episcopum Abredonensem, de Fratris Obitu; altera de Pace rupta inter Scotos et Gallos; autore Arturo Jonstono, Medico Regio." Aberdoniæ, 1628, 4to. After an interval of a few years, he published "Parerga Arturi Jonstoni Scoti, Medici Regii." Aberd. 1632, 8vo. And at the same time appeared "Epigrammata Arturi Jonstoni Scoti, Medici Regii." Aberd. 1632, 8vo. The first of these collections he dedicated in verse to Sir John Scot, and the second to the Earl of Lauderdale. He soon afterwards published "Cantici Salomonis Paraphrasis poetica." Lond. 1633, 8vo. This paraphrase, which he dedicated to the king, is accompanied with a specimen of his version of the psalms. The specimen includes the seven penitential, and the seven consolatory psalms; the former being dedicated to Laud bishop of London, and the latter to Lesley bishop of Raphoe. Dempster mentions his having translated the psalms into very elegant elegiac verse; and it is therefore to be presumed that Johnston long delayed the publication in order to give his version all the advantage of a deliberate revisal. He next produced a collection of short poems, entitled "Musæ Aulicæ." Lond. 1635, 8vo. They are accompanied with an English translation by Sir Francis Kinaston. This little work was followed by his complete version of the psalms. "Paraphrasis poetica Psalmorum Davidis, auctore Arturo Jonstono Scoto. Accesserunt ejusdem Cantica Evangelica, Symbolum Apostolicum, Oratio Dominica, Decalogus." Aberd. 1637, 8vo. It is dedicated in elegant and panegyrical verse to the Countess Marischal. Benson supposes the work to have been printed in London during the same year; but as it was printed there in 1657, the one edition may have been confounded with the other. About the same time he lent his aid to the publication of the "Delitiæ Poetarum Scotorum hujus ævi illustrium." Amst. 1637, 2 tom. 12mo. These volumes were neatly printed by Bleau, at the expense of Sir John Scot, who himself appears in the list of contributors, and who doubtless retained the power of admitting or rejecting. Johnston has frequently been considered as the editor, from the circumstance of his having written the dedication to Scot, and prefixed the "Musarum Elogia," addressed to the same individual. His contributions are more extensive than those of any other writer. The entire collection forms a conspicuous monument of the scholarship, ingenuity, and taste of our countrymen; and the poems of Johnston may safely be brought into competition with those of any other writer whose name is to be found in the catalogue of contributors.

Adjectis Prophylacticis adversus Andreæ Melvini Cavillum in Aram Regiam, aliisque Epigrammatis. Lond. 1618, 4to.—Among other works, Eglisham published "Prodromus Vindictæ in Ducem Buckinghamiæ, pro virulenta Cæde potentissimi Magnæ Britanniæ Regis Jacobi; nec-non Marchionis Hamiltonii, ac aliorum virorum principum." Francofurti, 1626, 4to. Sir Henry Wotton has stated that this work was "published and printed in divers languages," about the time of the king's death. (Reliquiæ Wottonianæ, p. 554.) There is an English edition of a more recent date. "The Fore-runner of Revenge: being two Petitions," &c. Lond. 1642, 4to.

[4] Dempsteri Historia Ecclesiastica Gentis Scotorum, p. 393.

On the 24th of June 1637, Johnston was elected rector of King's College, Aberdeen. The appointment is annual, and is considered as honourable. Dr Johnson, who describes him as principal of Marischal College,[1] must apparently have been misled by his imperfect recollection of this academical office; nor is this the only mistake into which he has fallen with respect to the same university. Thus, for example, he makes the extraordinary statement that "whoever is a master may, if he pleases, immediately become a doctor." In this city Johnston appears to have had many learned and distinguished friends, of whom we find various memorials in his works. Among these was the worthy bishop of the diocese, Patrick Forbes, who, like himself, was descended from the noble family of that name; the bishop's son, John Forbes, professor of divinity in King's College; William Forbes, principal of Marischal College, and afterwards bishop of Edinburgh; Robert Baron, professor of divinity in the same college, and afterwards bishop elect of Orkney; and David Wedderburn, professor of humanity in King's, and rector of the grammar school of Aberdeen.[2] This was indeed a brilliant era in the history of the university. Dr Baron, a great adept in scholastic philosophy and theology, seems to have enjoyed a large share of his esteem, and is highly extolled in his verses. Wedderburn was the companion of his early youth, and, cultivating the same elegant studies, continued to be the friend of his maturest years. Johnston addressed to him a long elegy, in which he recounted some of the events of his life, and Wedderburn replied in another elegy, expressive of the same unaltered regard.

Although he probably continued to pay occasional visits to Aberdeenshire, he must have chiefly resided in England after the date of his appointment as physician to the king; for it is evident from some of his verses that this appointment was not merely honorary, but required his attendance at court. In his native county he appears to have acquired some real property: under the great seal, 12 June 1629, there is a charter of confirmation, in his favour, of the lands of New Leslie in the parish of Alford. Soon after his return from the continent, he was engaged in a lawsuit before the court of session; and of advocates and attornies his experience seems to have led him to form no very favourable opinion. But his career, which was sufficiently brilliant, was not destined to be long: at the age of fifty-four, he died at Oxford in the year 1641, while on a visit to one of his daughters, who was married to a clergyman of the established church. His death was affectionately bewailed by his learned friend Wedderburn, whose *Suspiria* were printed at Aberdeen during the same year.

Johnston possessed a masterly command of Latin diction; and to this attainment he added great skill in the art of versification. He was likewise distinguished by no mean portion of poetical feeling and fancy, united with an elegant and classical taste. Although it cannot be affirmed that he never employs a word or phrase which does not belong to the best age of Latinity, his diction generally displays a great degree of purity;[3] and his ear had attained to exquisite nicety in the harmony of Roman numbers, particularly those of hexameter and pentameter verse. Such was his predilection for this combined metre, that he introduced it into almost all his compositions; and even his satires are written in the elegiac measure. His poems are very numerous, and are sufficiently miscellaneous. Some of them are obscure, not from the nature of the composition, but from their abounding in allusions to persons and circumstances not easily traced or recognized. Many of his epigrams are well turned; and his satirical powers are conspicuously displayed in his poems against Eglisham, and in several others. His version of the psalms has often received, and is evidently entitled to very high commendation. After the brilliant success of Buchanan, such an attempt might justly be considered as not a little hazardous; but it cannot be asserted that Johnston had made a delusive estimate of his own powers, for if he does not surpass or equal so great a master, he at least makes a near approach to his poetic excellence. In this version, he has adhered almost uniformly to his favourite elegiac verse: it is only in the hundred and nineteenth psalm that his metre is varied, and there every part is exhibited in a new species of verse. Buchanan's plan of varying the measure according to the characteristics of the poem, was evidently more eligible in a writer who possessed such versatility of talent. The Latin paraphrases of the psalms amount to a very large number; nor do we incur much hazard in averring that the two Scottish poets have excelled all their competitors.

Dr Beattie, who has passed a general condemnation on poetical paraphrases of the psalms, is by no means disposed to exempt those of Buchanan and Johnston from this sentence. "If we look into Buchanan, what can we say, but that the learned author, with great command of Latin expression, has no true relish for the emphatick conciseness, and unadorned simplicity, of the inspired poets? Arthur Johnston is not so verbose, and has of course more vigour: but his choice of a couplet, which keeps the reader always in mind of the puerile epistles of Ovid, was singularly injudicious. As psalms may, in prose, as easily as in verse, be adapted to musick, why should we seek to force those divine strains into the measures of Roman or of modern song? He who transformed Livy into iambicks, and Virgil into monkish rhime, did not in my opinion act more absurdly. In fact, sentiments of devotion are rather depressed than elevated by the arts of the European versifier."[4] These opinions of an elegant and tasteful writer appear to be somewhat hypercritical, nor do we feel entirely disposed to acquiesce in any of the dogmas which he has thus delivered. The charge of verbosity seems to be very unadvisedly brought against Buchanan; for, to adopt the words of Ruddiman, we know of no modern poet who has "better preserved that masculine and elegant simplicity, which we so much admire in the ancient writers, and whose stile is farther removed from all gaudiness and affectation."

The reputation of Johnston did not die with himself.

[1] Johnson's Journey to the Western Islands, p. 30. "One of its ornaments is the picture of Arthur Johnston, who was principal of the college, and who holds among the Latin poets of Scotland the next place to the elegant Buchanan."

[2] Wedderburn was likewise a contributor to the "Delitiæ Poetarum Scotorum." He published the following grammatical works. "A Short Introduction to Grammar." Aberd. 1632, 8vo. "Institutiones Grammaticæ." Aberd. 1634, 8vo. "Vocabula, cum aliis Latinæ Linguæ Subsidiis:" commonly subjoined to Simson's Rudimenta Grammatices. See Ruddiman's Bibliotheca Romana, p. 62. Vossius addresses Wedderburn as "homo eruditissimus, beneque promerens de studiis juventutis." (Epistolæ, p. 304. Lond. 1690, fol.) His merit as a grammarian is highly extolled in David Leitch's "Philosophia illachrymans, hoc est, Querela Philosophiæ, et Philosophorum Scotorum (præsertim vero Borealium) oratorie expressa." Aberdoniæ, 1637, 4to. His posthumous edition of Persius was published by his brother Alexander. "Persius enucleatus: sive Commentarius exactissimus et maxime perspicuus in Persium, poetarum omnium difficillimum, studio Davidis Wedderburni, Scoti, Abredonensis. Opus posthumum." Amst. 1664, 12mo.

[3] "Arturus Jonstonus," says Morhof, "in psalmorum versione, quemadmodum et in operibus ceteris, ubique purus et tersus est, ut ego quidem nihil in illo desiderare possim." (Polyhistor, tom. i. p. 1066.) Some objectionable words and phrases, used by Johnston, are enumerated in Ruddiman's Vindication of Buchanan, p. 70.

[4] Beattie's Dissertations, Moral and Critical, p. 645. Lond. 1783, 4to.

Soon after his death, a collection of his poems was published under the superintendence of William Spang, minister of the Scotish church at Campvere, whose name is well known to the readers of Baillie's Letters. "Arturi Jonstoni Scoti, Medici Regii, Poemata omnia." Middelb. Zeland. 1642, 16to. This collection, which is printed in a very diminutive form, includes his version of the psalms, and the various works which have already been enumerated, together with some shorter poems published for the first time. It was followed by "Arturi Jonstoni Scoti Psalmorum Davidis Paraphrasis poetica, nunc demum castigatius edita." Amst. 1706, 12mo. The editor was David Hoogstratan, well-known for his edition of Phædrus; and the volume is inscribed to Janus Broukhusius, an eminent scholar, at whose suggestion the edition was undertaken. After a short interval, Ruddiman published "Cantici Solomonis Paraphrasis poetica, Arthuro Jonstono Scoto, Medico Regio, auctore: editio nova, summo studio recognita, ac notis illustrata." Edinb. 1709, 4to. Edinb. 1717, 8vo. Johnston found a more zealous admirer in William Lauder, who inserted his sacred poems in a collection entitled "Poetarum Scotorum Musæ Sacræ: sive quatuor Sacri Codicis Scriptorum, Davidis et Solomonis, Jobi et Jeremiæ, Poetici Libri, per totidem Scotos, Arct. Jonstonum et Jo. Kerrum, P. Adamsonum et G. Hogæum, Latino carmine redditi: quibus, ob argumenti similitudinem, adnectuntur alia, Scotorum itidem, Opuscula Sacra." Edinb. 1739, 2 tom. 8vo. The first volume contains a life of Johnston, together with the testimonies of various learned writers.[1] His paraphrase was also published separately; and the editor obtained from the general assembly a recommendation that it should be taught in the lower forms of grammar schools, as a precursor to that of Buchanan. An elegant edition of the latter, "cum notis variorum," had been published in 1737 by Robert Hunter and John Love, the one professor of Greek at Edinburgh, and the other master of Dalkeith school. Love now thought it incumbent upon him to extol Buchanan, and to censure Johnston; Lauder was far from being satisfied with his criticisms, and an acrimonious controversy ensued between them. Johnston's cause was espoused with great warmth by Mr Benson, who began his operations by publishing "A Prefatory Discourse to a new Edition of the Psalms of David, translated into Latin verse by Dr Arthur Johnston, Physician to King Charles the First: to which is added, a Supplement, containing a Comparison betwixt Johnston and Buchanan." Lond. 1741, 8vo. This precursor was speedily followed by "Arturi Jonstoni Psalmi Davidici, interpretatione, argumentis, notisque illustrati, in usum Serenissimi Principis." Lond. 1741, 4to. & 8vo. Each of these editions is elegantly printed, and contains a portrait of Johnston, engraved by G. Vertue. The life of the poet, we are informed, was translated into Latin by Dr Ward, professor of rhetoric in Gresham College;[2] and it may be conjectured that he also lent his aid in the preparation of the notes and interpretation, which are modelled on those of the editions for the use of the Dauphin. Not satisfied with the honour thus paid to a favourite poet, he soon afterwards published "Arturi Jonstoni Psalmi Davidici, cum Metaphrasi Græca Jacobi Duporti, Græcæ Linguæ apud Cantabrigienses Exprofessoris Regii." Lond. 1742, 8vo.[3] This volume is without preface or annotations; nor is the name of Benson appended to any of these publications. The learned Ruddiman, who was roused to some degree of indignation by his disparaging animadversions on Buchanan, prepared an elaborate volume, consisting of nearly four hundred pages, and bearing the following copious title: "A Vindication of Mr George Buchanan's Paraphrase of the Book of Psalms, from the Objections rais'd against it by William Benson, Esq. Auditor in Exchequer, in the Supplement and Conclusion he has annex'd to his Prefatory Discourse to his new Edition of Dr Arthur Johnston's Version of that sacred book: in which also, upon a comparison of the performances of those two poets, the superiority is demonstrated to belong to Buchanan: wherein likewise several passages of the original are occasionally illustrated: together with some useful observations concerning the Latin Poetry and Arts of Versification: in a Letter to that learned Gentleman." Edinb. 1745, 8vo. This volume, which displays a masterly knowledge of the Latin language and literature, may still be read for the valuable information which it contains. Although he gives a decided preference to Buchanan, he is far from being insensible to the eminent merit of Johnston, on whom he here bestows no mean commendation. "I have as high an opinion of Dr Johnston's extraordinary genius as most men have, at least as I think it ought to have; and am satisfied that, for the elegancy and purity of his diction, the sweetness and smoothness of his verse, in short all the other ingredients that are required to the composition of a great and masterly poet, he was inferior to none, and superior to most of the age he lived in. Nay, I will allow farther that, in my judgment, he deserves the preference to the far greater part of those that have lived since or before him." And in the last work which he gave to the public, he speaks of him in terms of warm and discriminating praise. "The other I shall name is Dr Arthur Johnston, physician to King Charles I., whom I will not be so foolish as, with Mr Auditor Benson, to exalt above the poets of the Augustan age, or even to prefer him to Buchanan, but this I can and will say, that tho' some few of them may have more of pomp and grandeur, of force and energy in their poetry, yet for the sweetness and smoothness, the delicacy and harmoniousness of his numbers, he is not to be equalled in any nation since Ovid's time."[4]

His youngest brother, William Johnston, M. D. is mentioned by Urquhart as "a good poet in Latine, and a good mathematician." He was educated in Marischal College, Aberdeen, and afterwards visited several foreign universities. He successively taught humanity and philosophy in the university of Sedan, where he is said to have acquired much reputation.[5] In the year 1626 he

---

[1] Lauder and Benson have both overlooked the testimony of Olaus Borrichius, a learned Dane, which is highly favourable, and which commences thus: "In Arturo Jonstono Scoto, medico regio, redivivum agnoscimus Buchananum, ita non modo divinum Psalten nova et speciosa veste poetica induit, sed et in seriis jocisque, in laudibus et insectationibus, immo, quocunque stylum vertit, floridus est, copiosus, disertusque, nec usquam exemplorum inops, aut scaber. Onopordum quendam, in Musas Buchanani temerario judicio involantem, ita depexum reddidit amarissimis, sed una suavissimis elegis, ut quivis malit esse Thersites in Græcia, quam in Britannia Onopordus." (Dissertationes Academicæ de Poetis, p. 152. Francof. 1683, 4to.)

[2] Nichols's Literary Anecdotes of the eighteenth Century, vol. v. p. 522.

[3] Buchanan's paraphrase was published in a similar manner. "Psalmorum Davidicorum Metaphrasis, Græcis versibus contexta per Jacobum Duportum Cantabrigiensem: cui in oppositis paginis respondens accessit Paraphrasis poetica Latina, auctore Georgio Buchanano Scoto: utræque summa cura recognitæ et castigatæ." Lond. 1742, 8vo. The preface, subscribed R. R. is dated "Westmonasterii, viii. Cal. Aprilis, 1742." The editor has added a single note, which relates to Buchanan's dedication, and to the four verses which Atterbury proposed to substitute for the conclusion.

[5] Gul. Smith Oratio in qua inclytæ Academiæ Marischallanæ Abredonensis nobilissimus Parens, illustres Mæcenates, et eximii Benefactores, ad annum M.DC.XCVI. commemorantur, p. 24. Abredeis, 1702, 4to. Andrew Strachan, a professor of King's College,

was appointed professor of mathematics in Marischal College, and here he continued till the time of his death, which took place on the 15th of June 1640.[1] With his academical labours he probably combined the practice of physic; and his circumstances were so prosperous that he purchased the estate of Beidelstone in the parish of Dyce and county of Aberdeen. By his wife, who was the youngest daughter of Abraham Forbes of Blackstoune, he left a son and two daughters.

Another Latin poet, John Johnston, was likewise connected with this family. He was the son of Johnston of Crimond in Aberdeenshire; and after completing the usual course in King's College, he prosecuted his studies on the continent, where he continued to reside for the space of eight years. He successively studied in the universities of Helmstadt, Rostock, and Geneva. After having visited England, he at length returned to his native country, and in 1593 was appointed professor of divinity in the university of St Andrews, where he was associated with Andrew Melville. He married Catharine Melville, of the family of Carnbee, and lived to lament her loss, and that of two children. He died on the 20th of October 1611.[2] Among other works, he published the two following. "Inscriptiones Historicæ Regum Scotorum, continuata annorum serie a Fergusio primo regni conditore ad nostra tempora; Joh. Jonstono Abredonense Scoto authore. Præfixus est Gathelus, sive de Gentis Origine Fragmentum An. Melvini." Amst. 1602, 4to. "Heroes ex omni Historia Scotica lectissimi, auctore Johan. Jonstono Abredonense Scoto." Lugd. Bat. 1603, 4to. Both works consist of short inscriptions, written in elegiac verse, and exhibiting a vein of ancient simplicity. Besides a prose work, entitled *Consolatio Christiana*, he is likewise the author of some sacred poems, printed at Saumur in 1611.[3]

John Johnston, M. D. must not be confounded with the professor of divinity. He was born at Sambter in Poland, on the 3d of September 1603, but was descended of Scottish ancestors; who, according to his continental biographers, were of "the illustrious family of Johnston of Crogborn,"[4] meaning perhaps Craigsburn. His native country was formerly replenished with Scottish emigrants; and during the seventeenth century, as we are assured by Lithgow, it contained no fewer than thirty thousand Scottish families.[5] Part of his education he received at St Andrews, and he afterwards prosecuted his studies in several other universities. On returning to Poland in 1632, he was engaged to accompany two young gentlemen on their travels; and, during a period of four years and a half, they visited France, Italy, and various other countries. He took his doctor's degree at Leyden, and was admitted *ad eundem* at Cambridge. The unsettled state of his own country induced him to seek another place of abode; and he withdrew to the duchy of Lignitz in lower Silesia, where he purchased the estate of Ziebendorf, and united the practice of physic with a variety of learned pursuits. By his writings he acquired so much reputation, that he was successively offered a medical chair in the university of Frankfort and in that of Leyden; but preferring a more retired mode of life, he continued to reside at his own seat till the period of his death, which took place on the 8th of June 1675. His remains were interred at Lessno in Poland on the 30th of September. Johnston was twice married, and by his second wife had several children. The most elaborate of his works bears the title of *Historia Naturalis*, and is divided into five volumes folio. His other publications, which amount to a very considerable number, chiefly relate to natural history and medicine. He published a short compendium of civil history, entitled *Polyhistor*, and a treatise "De Festis Hebræorum et Græcorum." (x.)

JOHNSTONE, Robert, is a Scotish historian of considerable reputation, but his personal history is very imperfectly known. We are however informed that he was the son of an honest burgess of Edinburgh, and that he was educated in the university of his native city.[6] He took the degree of A. M. in the year 1587. His father may perhaps have been a native of Annandale, where Johnstone is still a prevalent name. The son bequeathed legacies to some of his cousins in Annandale, L.500 sterling in trust to Lord Johnstone for building a bridge over the river Annan, and L.1000 in trust to the same nobleman for the maintenance of a grammar school at Moffat. Whether he prosecuted his studies in some foreign university, and there took his degree of LL. D., we are not informed. He appears to have fixed his residence in London, and to have inherited or acquired a considerable fortune. Dempster, to whom we are indebted for many scattered notices of Scotish writers, has stated that he was particularly esteemed by Lord Bruce of Kinloss, and, although not a courtier, that he was acceptable to King James.[7] His testament, extracted from the register of the prerogative court of Canterbury, has lately been printed, and reflects some additional light upon his history.[8] He there describes himself as "Robert Johnstone, of the parish of St Anne, Blackfryers, London, Esquire." The codicil is dated on the 12th of October 1639, and probate was granted to one of his executors six days afterwards; so that the testator must have died in that interval. The greatest part of his property he bequeathed to charitable and benevolent purposes. It is however to be suspected that his laudable intentions were in some cases frustrated: the bridge was never built over the Annan, nor did Moffat school derive much benefit from his legacy. He had been appointed one of the executors of George Heriot; and he bequeathed L.1100 to the hospital. He bequeathed L.1000 "towards the maintenance of eight poor scholars" in the university of Edinburgh. The destination of his library is thus expressed: "As for my books, I do appoint the books of humanity, Thesaurus Linguæ Latinæ, and Lexicon Græcum, to be sent unto Moffat in Annandale, when the aforesaid school is ereckted, with the Latin poets and commentaries: as for the Italian, French, and Spanish books, I would have them changed for books of philosophy, to be sent unto the College of Edinburgh: for my civil law books, and books of

---

speaks of Dr Johnston in the following terms: "De Gulielmo certe idem usurpare possumus, quod olim de Tito Imperat. suavissimo dictum est, *Deliciæ est humani generis*; tanta est ejus comitas, tanta urbanitas." [7] "Robertus Johnstonus, Baroni Killosensi dum vivebat carus, vir variæ lectionis, raræ eruditionis, scripsit Historiam sui Seculi Latine, lib. i. et tersissimam, ut est limati judicii. Vivit adhuc Londini virtutis merito, licet non aulicus, regi acceptus." (Dempsteri Historia Ecclesiastica Gentis Scotorum, p. 394.)

[8] Constable's Memoirs of George Heriot, p. 163. Edinb. 1822, 8vo.

history, I give also to the said College of Edinburgh; and my English books I give unto my said servant Hendry Heron."

Dr Johnstone had prepared a history of his own time; and the earliest part of it, consisting of two books, appeared under the title of "Historiarum libri duo, continentes Rerum Britannicarum vicinarumque Regionum Historias maxime memorabiles. Sunt præter hos adhuc xx. libri, qui typographo nondum in manus venere." Amst. 1642, 12mo. It contains the author's dedication to King Charles, and the subsequent epigram, "Ad Robertum Johnstonum Scoto-Britannum," written by John Owen:

> Ingenii, Johnstone, tui sum factus amator,
> Historiæ legerem dum monumenta tuæ.
> Nil magis ingenuum, nihil ingeniosius extat
> Tergeminæ Britonum gentis in historia:
> Excipias unum Morum de rege Ricardo,
> Nemo Britannorum dignior invidia.

Such portions of the volume as relate to Scotish history were soon afterwards translated into English: "The Historie of Scotland during the Minority of King Iames: written in Latine by Robert Johnston: done into English by T. M."[1] Lond. 1646, 12mo. This translator was perhaps Thomas Middleton, author of the Appendix to Spotswood's History. The identity of the historian and of the individual who died in 1639, is established by the testimony of the translator, who mentions his author's bequest to the university of Edinburgh. He has however magnified the eight exhibitions into eight fellowships. The entire history at length made its appearance in an ample volume: "Historia Rerum Britannicarum, ut et multarum Galli carum, Belgicarum, et Germanicarum, tam politicarum quam ecclesiasticarum, ab anno 1572 ad annum 1628." Amst. 1655, fol. The editor, under the signature of J. S. has prefixed a very brief notice, which contains an erroneous statement of the author having himself published the first two books. Buchanan's history, according to the opinion of Nicolson, has been "continu'd in the same fine language" by Johnstone;[2] and Lord Woodhouselee describes this continuation as "a work of great merit, whether we consider the judicious structure of the narrative, the sagacity of the reflections, the acute discernment of characters, or the classical tincture of the style. In those passages of his history where there is room for a display of eloquence, he is often singularly happy in touching those characteristic circumstances which present the picture strongly to the mind of the reader, without a vain parade of words, or artificial refinement of sentiment."[3] Of this high commendation we are however disposed to make some abatement, both as to the matter and style of Johnstone's history. (x.)

JOHNSTONE, a modern and thriving village of Scotland, in the county of Renfrew, at the distance of about three miles west from Paisley. It owes its origin entirely to manufactures, as about forty years ago only a few cottages stood where now is seen a town consisting of two large squares, many considerable streets, and public works. It is regularly laid out, there being one main street, which is crossed by others at right angles. The houses are substantially built, and for the most part two stories high. There are within the precincts of the place seventeen cotton mills of various extent, and other three in the neighbourbood. There are also in the town two brass and two extensive iron founderies; five machine manufactories, and a public gas-work. Besides a chapel of ease belonging to the Scotch church, there is here a United Secession and Relief church, a Universalist, and Methodist chapel. In Johnstone are also a town school, a subscription library, two news-rooms, a mechanics' institution and library, and sundry benevolent and religious societies. The Ardrossan Canal from Glasgow terminates in a basin at the east end of the town. In its neighbourhood are four collieries, which are of great advantage to a place to which coal is of essential importance. The population in 1811 amounted to 3647, and in 1818 to 5000.

JOHNSTON'S Isle, a small island in the Eastern Seas, surrounded by a cluster of others. It is covered with verdure and cocoa-nut trees. Long. 131. 12. E. Lat. 3. 11. N.

JOHORE, a town of Malacca, and capital of an independent Malay principality, situated near the southern extremity of the peninsula of Malacca, twenty miles up a river of the same name. It was founded in 1511 by the inhabitants of Malacca, who fled thither on the capture of their city by the Portuguese. In 1603 Johore was also taken by the Portuguese, but rebuilt a little higher up the river. The surrounding country abounds in pepper, tin, gold, sago, and elephants' teeth. The inhabitants bring these articles in their own prows to Prince of Wales' Island, and receive in return opium and other goods. Long. 104. 5. E. Lat. 1. 40. N.

JOIGNY, an arrondissement of the department of the Yonne, in France. It extends over 774 square miles, is divided into nine cantons, and these into 110 communes, having a population of 78,687 persons. The capital, from which the circle takes its name, is a city on a hill, rising from the banks of the river Yonne. It is surrounded with walls, has a fine market-place, and 1000 houses, with 5176 inhabitants. There are some manufactures of cloth and of leather. Long. 3. 55. E. Lat. 47. 50. N.

JOINERY.

Is one of the useful arts which contributes most materially to the comfort and convenience of man. As the arts of joinery and carpentry are often followed by the same individual, it appears, at first view, natural to conclude, that the same principles are common to both these arts. But a closer examination of their objects leads us to a different conclusion.

arpentry fined.

The art of Carpentry is directed almost wholly to the support of weight or pressure; and, therefore, its principles must be found in the mechanical sciences. In a building, it includes all the rough timber-work necessary for support, division, or connection; and its proper object is to give firmness and stability. See the Article Carpentry.

oinery fined.

The art of Joinery has for its object the addition in a building of all the fixed wood-work necessary for convenience or ornament.. It is the *Intestinum opus* of Vitruvius, and the *Menuiserie des bâtimens* of the French.

The joiner's works are many of them of a complicated nature, and require to be executed in an expensive material; therefore joinery requires much skill in that part of geometrical science which treats of the projection and description of lines, surfaces, and solids, as well as an intimate knowledge of the structure and nature of wood.

It may also be remarked, that the rough labour of the carpenter renders him in some degree unfit to produce that kind of accurate and neat workmanship which is expected from a modern joiner.

rogress of oinery in ngland.

In early times, very little that resembles modern joinery was known; every part was rude, and joined in the most artless manner. The first dawnings of the art appear in the thrones, stalls, pulpits, and screens of our cathedrals and churches; but, even in these, it is of the most simple kind, and is indebted to the carver for every thing that is worthy of regard. Whether in these monuments, the carver and the joiner had been one and the same person we cannot now determine, though we imagine, from the mode of joining in some of them, that this was the case.

During several centuries joinery seems to have been gradually improving, but nothing appears to have been written on the art before 1677, when Mr Joseph Moxon, a Fellow of the Royal Society, published a work, entitled *Mechanick Exercises*, or the *Doctrine of Handyworks.* In this work the tools, and common operations in joinery, are described, with a collection of the terms then in use. It must have been a valuable work at that time, but to a master in the art it would convey little if any thing that was new. Sash-windows were introduced into England some time before the date of Moxon's work, but he has not noticed them. According to the observations of Dr Thomson this important improvement has not yet found its way into Sweden.[1]

About the beginning of the last century several works of a most interesting kind made their appearance. Forms began to be introduced in architecture, which could not be executed at a moderate expense without the aid of new principles, and these principles were discovered and published by practical joiners. As might naturally be expected, these authors had but confused notions, with a scanty portion of geometrical knowledge; and, accordingly, their descriptions are often obscure, and sometimes erroneous.

The hand-rails of stairs offered many difficulties, and an imperfect attempt to remove them was first made by Halfpenny, in his *Art of Sound Building*, published in 1725. Price, the author of the *British Carpenter*, published in 1733, was more successful, and his remarks show a considerable degree of knowledge of the true nature and object of his researches.

The publication of Price's work must have produced a considerable sensation among joiners, for it was soon followed by many other works of different degrees of merit. Of these the works of Langley and Pain were the most popular.

The establishment of the principles of joinery, on the sound basis of geometrical science, was reserved for Nicholson. In his *Carpenters' Guide*, and *Carpenter and Joiners' Assistant*, published in 1792, he has made some most valuable corrections and additions to the labours of his predecessors.

Corresponding improvements were also made in the practice of joinery, for which we are much indebted to the late Mr James Wyatt. This celebrated architect kept together some of the best workmen in London, who were looked up to with a degree of emulation by young men, which had a beneficial effect on the progress of joinery. But the art is still far short of perfection. We conceive that many of those operations, on which the soundness of work chiefly depends, might be done with greater exactness, and less labour, by means of tools contrived for these purposes. The truth and certainty which have been introduced in block-making, is sufficient to encourage some one to extend the same manner of mortising in joinery. See Block-Machinery.

Progress of Joinery in France.

The principles of joinery were cultivated in France by a very different class of writers. In the extensive work of Frezier, entitled *Coupé des Pierres et des Bois*, 3 vols. 4to, 1739, all the leading principles are given and explained with tedious minuteness, offering a striking contrast to the brevity of our English writers. The first elementary work on that part of geometrical science, which contains the principles of joinery, appeared in France in 1705, from the pen of the celebrated Gaspard Monge, who gave it the name of *Géométrie Descriptive.* Much of what has been given as new in English works, had been long known on the Continent; but there does not appear to have been much, if any, assistance derived from these foreign works by any writer prior to Nicholson.

The latest French work which treats of joinery is Rondelet's *L'Art de Bâtir.* It is also the best foreign work on the subject that we have seen; but it is not at all adapted to the state of joinery in England. In practice, the French joiners are very much inferior to our own Their work is rough, slovenly, and often clumsy, and at the best is confined to external effect. The neatness, soundness, and accuracy, which is common to every part of the works of an English joiner, is scarcely to be found in any part of the works of a French one. The little correspondence, in point of excellence, between their theory and practice, leads us to think that their theoretical knowledge is confined to architects, engineers, &c. instead of being diffused among workmen, as it is in this country.

In cabinet-work the French workmen are certainly superior, at least as far as regards external appearance; but when use, as well as ornament, is to be considered, our own countrymen must as certainly carry away the palm.

[1] *Travels in Sweden*, p. 8.

Joinery.

The appearance of French furniture is much indebted to a superior method of polishing, which is now generally known in this country.[1] For many purposes, however, copal varnish (such as coachmakers use) is preferable; it is more durable, and bears an excellent polish.

Geometrical knowledge necessary.

Geometry is useful in all, and absolutely necessary in some, parts of a joiner's business; but it is absurd to encounter difficulties in execution, and to sacrifice good taste, convenience, economy, and comfort, merely for the purpose of displaying a little skill in that science. It is, however, a common fault among such architects as are better acquainted with geometrical rules than with the production of visible beauties, to form designs for no other purpose than to create difficulties in the execution.

But, when geometrical science is properly directed, it gives the mind so clear a conception of the thing to be executed, that the most intricate piece of work may be conducted with all the accuracy it requires.

Practice of Joinery.

The practice of joinery is best learned by observing the methods of good workmen, and endeavouring to imitate them. But the sooner a workman begins to think for himself the better; he ought always to endeavour to improve on the processes of others; either so as to produce the same effect with less labour, or to produce better work.[2]

We intend, in this article, to give a plain and simple exposition of the most valuable principles of the art of joinery, which will, we hope, place many parts of the practice under a new point of view, and ultimately tend to improve them.

Cabinet-Making.

Cabinet-making, or that part of the art of working in wood which is applied to furniture, has little affinity with joinery, though the same materials and tools be employed in both. Correctness and strict uniformity are not so essential in moveables as in the fixed parts of buildings; they are also more under the dominion of fashion, and therefore are not so confined by rules as the parts of buildings.

Cabinet-making offers considerable scope for taste in beautiful forms, and also in the choice and arrangement of coloured woods. It requires considerable knowledge in perspective, and also that the artist should be able to sketch with freedom and precision.

If the cabinet-maker intend to follow the higher departments of his art, it will be necessary to study the different kinds of architecture, in order to make himself acquainted with their peculiarities, so as to impress his works with the same character as the rooms they are to furnish.

In as far as regards materials, and the principles of joining work, the cabinet-maker will find some useful information in the second and third sections of this article. In ornamental composition he may derive much benefit from Tatham's *Etchings of Ancient Ornamental Architecture*, London, 1799; Percier and Fontaine's *Recueil des Décorations Intérieures comprenant tout ce qui a rapport à l'Ameublement*, Paris, 1812; and, for general information, the *Cabinet Dictionary*, and the *Cabinet-Maker and Upholsterer's Drawing-Book* of Sheraton, may be consulted.

Sect. I.—On making Working Drawings.

1. In this section we propose to lay before the reader the most important part of the principles of describing, on a plane surface, the lines necessary for determining bevels, forming moulds, or any other purpose required in the practice of joinery. The limits within which such an article as joinery must be confined, in a work like this, will not permit us to enter much into detail on the various points to be illustrated in this section; but we hope, by judicious selection, to place under one point of view the principles that are most useful to the joiner.

Projection of Bodies.

Nature of Projection illustrated.

2. A clear idea of the nature of projection is so essential in making working drawings, that, in our endeavours to illustrate it, we cannot proceed upon principles too simple. In the first stage of such an inquiry, experiment furnishes at once the most clear and satisfactory evidence, particularly to those who are not familiar with mathematical subjects.

If some small pieces of wood, or pieces of wire, were joined together, so as to represent the form of a solid body, a cube for example, and if this figure were held between the sun and the surface of a plane board, then the shadow of the figure upon the board would be its projection upon that plane. From this simple experiment, it will appear, that the projection of any line placed in the direction of the sun's rays will be a point: the projection of any line parallel to the plane will be of the same length as the line itself, and the projection of any line inclined to the plane will be always shorter than that line.

3. We have supposed the board to be placed at any angle with the direction of the rays of the sun; but, for our present purpose, it is sufficient to consider them to fall perpendicularly upon it; hence it is obvious, that to project a straight line upon a plane, a perpendicular to the plane should be let fall from each end of the line, and the line joining the points where the perpendiculars meet the plane will be the projection required.

When a projection is made upon a horizontal plane, it is usually called a *plan* of the body. When the projection is upon a vertical plane, it may be an *elevation* or a *section* of the body; it is a section when a portion is supposed to be cut off; and the plane of projection is usually parallel to the plane of the section.

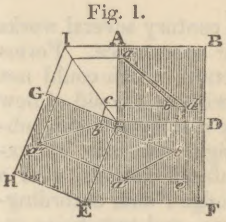
4. Bodies may be divided into three classes, according to the kinds of surfaces by which they are bounded. The first class, comprehending those which are bounded by plane surfaces, such are cubes, prisms, pyramids, and the like. The second class contains those which are bounded in part by plane surfaces, and the rest by curved surfaces, as cylinders, cones, &c. The third, including those which are bounded by curved surfaces only, as spheres, spheroids, &c.

The projections of the first class of bodies will consist of straight lines; those of the second class, of curved as well as straight lines; and those of the third class, of curved lines only.

Projection of lines.

4. Let ABCD, and CDEF, Fig. 1, be two plane surfaces, connected by a joint at CD, so that while the plane CDEF remains horizontal, the plane ABCD may be placed perpendicular to it, and thus represent a vertical plane. Then, if a line be so placed in space that ab is its projection on the vertical plane, and $a'b'$ its projection on the horizontal plane, its projection on any other vertical plane, HGEC, may be determined. This is easily effected, for we have seen, that if a perpendicular be drawn

Fig. 1.



[1] The method of making and using the French polish is minutely described in Dr Thomson's *Annals of Philosophy*, vol. xi. p. 119 and 371.

[2] Descriptions of the tools, with instructions for using them, may be found in Moxon's work before quoted, and in Nicholson's *Mechanical Exercises*, Taylor, London, 1812.

 to the plane from each end of the given line, they will give the positions of the ends of the line in the projection (Art. 3). Now, the same thing will be done, by drawing $a'a''$ and $b'b''$ perpendicular to EC, and setting off the points a'' and b'' at the same height above EC respectively, as a and b are above CD, then the line $a''b''$ is the projection required.

The heights may be transferred from one vertical plane to another when they are both supposed to be laid flat, by drawing the line IC, so as to bisect the angle ECD, and if cb be parallel to CD, meeting IC in c, then a line drawn parallel to EC, from the point c, will give the height of the point b'', and so may be found the height of any other point.

o determine the ngth of a ojected ne.

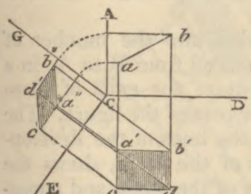
6. In the particular case we have drawn, none of the projections represents the real length of the given line. To obtain this length, draw $a'e$ parallel to CD, and with the radius ab' describe the arc $b'e$ cutting $a'e$ in e; draw de perpendicular to CD, cutting the line cb in d; join ad, and it is the length of the given line.

rojection planes.

The real lengths of lines frequently are not given, therefore another general method of finding them will be found useful, and which may be stated as follows: the length of an inclined line projected upon a plane is equal to the hypothenuse of a right-angled triangle, of which one side is the projection upon the plane, and the other side is the difference between the perpendicular distances of the extremes of the line from the plane.

7. In fig. 2, $a'b'cd$ represents the horizontal projection, or plan, of a rectangular surface, and the elevation ab shows its inclination; and its projection against another vertical plane, making any angle ECD with the former, or plane of elevation, is shown by $a''b''c'd'$. GC being perpendicular to EC, and AC perpendicular to CD, the heights may be transferred by means of arcs of circles described from C as a centre. This is a better method than that by bisecting the angle given in fig. 1; but neither of them so good, in practice, as setting of the heights with the compasses, or with a lath. In our figures it is desirable to shew the connection of corresponding parts as much as possible; therefore, the reader will bear in mind that many of the operations we describe may be done with fewer lines when the operator is fully master of his subject.

Fig. 2.



8. It may be further noticed in this place, that when a point is to be determined in one line by the intersection of another, the lines should cross each other as nearly at right angles as possible; for, when the intersecting lines cross very obliquely, a point cannot be determined with any tolerable degree of accuracy.

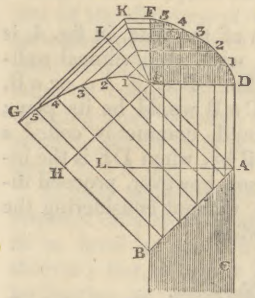
ojection curved es.

9. A curved line can seldom be projected by any other means than by finding a number of points through which the projected line must be drawn, or finding a series of tangents to the section. In giving an example of the projection of a body bounded by a curved surface, we shall select a case of frequent occurrence in practice, referring to the *Géométrie Descriptive* of Monge, for more general methods.

Let ABC be part of the plan of the base of a solid, fig. 3, and FED its end elevation; the upper side of the solid being bounded by the curved surface FD. This solid is supposed to be cut at AB by a plane perpendicular to the base, and our intention is to shew the form of the section.

Draw EH parallel to BA, and GIHE will represent the plane upon which the section is to be projected. Set off any convenient number of points, 1, 2, 3, 4, &c. in the given curve FD, from each of these points draw a line perpendicular to ED, to meet BA; and from the points in BA, thus determined, erect perpendiculars, which will cut HE at right angles. Make GH equal to FE, and set off the points 1, 2, 3, &c. in GHE at the same distances respectively from HE as the corresponding points 1, 2, 3, &c. in EFD are from the line ED. A curve being drawn through the points E, 1, 2, 3, 4, 5, G will complete the section. In large works, the joiner will often find it useful to put nails in the points, and to bend a regular lath against the nails; with the assistance of the lath, the curve may be drawn with more regularity.[1]

Fig. 3.



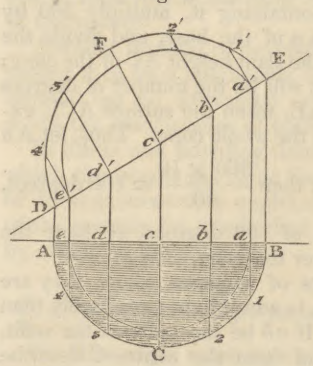
If the curve FD were very irregular, or a mixed line of straight parts and curved ones, the same method would determine the section; all the caution required is, that a sufficient number of points should be fixed upon in the given curve; and upon the proper selection of these points much of the accuracy of the section will depend.

The angle ribs of groined ceilings, the angle ribs for coved ceilings, or brackets for large cornices, and the angle cantilevers for balconies or other works of a similar kind, are found by this method. If FD be the cross rib of a groin, then GE will be the form of the corresponding angle rib. Also, if the angle of a room be represented by LAC, and FD be the cove for the ceiling, then GE will be the proper angle rib for such a cove.

In some cases, the section may be determined by means of the properties of the given curve, when the nature of that curve is known. Thus the oblique section of a cylinder is an ellipse, and the sections of a cone are certain figures depending on the direction of the plane of section (see the article Conic Sections); but if an architect were confined to the use of geometrical curves, there would be small scope, indeed, for a display of taste in his art; therefore the joiner must generally have recourse to the simple method we have described.

10. The section of a body may often be drawn by a more simple and direct process; and yet where the principle is still the same. Thus the section of the half cylinder ACB, in fig. 4, being compared with the process in fig. 3, will be found to be the same in every respect, excepting in the position of the parts of the figure. In fig. 4, ACB is the end or plan of the cylinder, and DE the inclination of the plane by which it is cut. Let the ordinates $a\,1$, $b\,2$, &c. in the plan, be drawn perpendicular to AB, and continued till they cut the inclined line DE. Also draw the ordinates $a'\,1'$, $b'\,2'$, &c. perpendicular to the line DE, and make the distances $a'\,1'$, $b'\,2'$, &c. respectively equal to the corresponding distances $a\,1$, $b\,2$, &c. upon the plan. Through the points E, $1'$, $2'$, &c. draw the curve DFE.

Fig. 4.



As the curve DFE is an ellipse, when ABC is a circle, in that case it will be better to draw an ellipse with a tram-

[1] A simple and convenient instrument for this purpose is described in the *Transactions of the Society of Arts*, for 1817, vol. xxxv. p. 109.

mel, or any other machine that produces the curve by a continued motion. (See the article ELLIPTOGRAPH.) DE is the transverse, and Fc' the semi-conjugate axis of the ellipse.

The most important application of the case, in fig. 4, is to the hand-railing of a staircase, with a curvilineal well-hole, or opening down the middle. For, if Ae, or aB, show the breadth of the rail, AeCaB would be its plan; and De'Fa'E the form of a mould, commonly called a face mould, for cutting out the rail by, when DE is the inclination of the plank. We cannot, however, proceed directly to the subject of stair-rails, without considering the development of the surfaces of bodies.

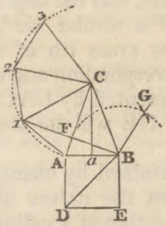
Development of Surfaces.

To develope a pyramid.

11. To develope the surface of a solid, is to draw, on some plane surface, a form that would cover it. If this form were drawn upon paper, and the paper were cut to it, the paper, so cut, ought to cover exactly the surface of the solid. Now, in joinery, it is often required that a mould should apply to a curved surface; and, therefore, the developement of that surface upon a flexible material gives the form of the mould.

The covering of a square pyramid may be found by erecting a perpendicular from the middle of one of the sides of its base, as from a in the side AB, fig. 5. Upon this perpendicular set off aC equal to the slant height of the pyramid; then, with the radius AC and centre C describe the arc A3, and set off the distance AB three times upon the arc. Join the points C3, C2, C1, CA, and CB, and draw the lines 32, 21, 1A, which determine the covering required.

Fig. 5.

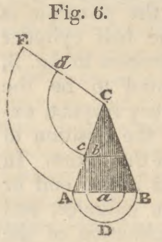


It is obvious, that we could develope a pyramid of which the base might have any number of sides, by the same method; and that a near approximation to the development of a right cone might be effected by the same means, which, in fact, is the means usually employed. But the following method of spreading out the surface of a cone will be found more correct.

To develope a cone.

12. Let ABC, fig. 6, be the elevation of a cone, and ADB half the plan of its base. With the radius AC describe the arc AE, which will be the line bounding the development; and, to find the length of the arc, or rather the angle containing it, multiply 360 by the radius Aa of the base, and divide the product by the slant height AC of the cone; the quotient will be the number of degrees in the arc AE, when the surface ACE exactly covers the whole cone. Thus, let Aa be 12 feet, and AC 40 feet; then $\frac{360 \times 12}{40} = 108$ degrees, and making ACE an angle of 108 degrees, we have the sector ACE that would cover the cone.

Fig. 6.



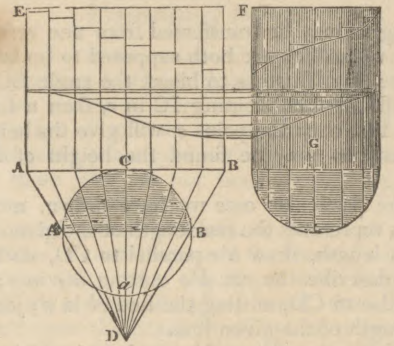
This applies to the soffits of windows, where they are enlarged towards the inside, to admit light more freely than square recesses would do. If ab be the width of the soffit, draw cb parallel to AB, and from the centre C describe the arc cd. Then half the developement AEcd will be the mould for the soffit; or the form of a veneer that would cover it.

To develope a cylinder.

13. The development of a cylinder is also of use in forming the mould for soffits, but is still more useful in the construction of stairs; and, as we are obliged to consider it as a prism with numerous sides, it is obvious that any other body of a like kind may be developed by the same means.

Let ABC, fig. 7, be the plan of half a cylinder, and A$'$E its height. Divide the curve ACB into any convenient number of equal parts, and let these parts be set off from C to A, and from C to B$'$. When the curve is a semicircle, divide the diameter AB into the proposed number of parts, and make aD equal to three-fourths of the radius. From D, through the points A and B, draw the lines DA$'$, DB$'$, then A$'$B$'$ is nearly equal to the curve ACB stretched out;[1] and, by drawing a line from D through each of the divisions in AB, the line A$'$B$'$ will be divided into the same number of equal parts.

Fig. 7.



In either case, erect a perpendicular from each point of division, and EA$'$B$'$F will be the development of the surface.

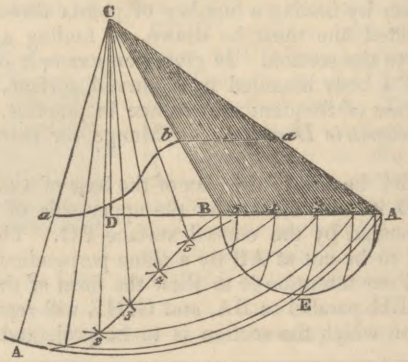
If we suppose A$'$B$'$ to be divided into the number of steps that would be necessary to ascend from B to A, in a circular staircase, the development of the ends of these steps may be drawn as in the upper part of the figure. The projection G of the cylinder, with the lines of the development drawn upon it, and the ends of the steps, shews the waving line formed by the nosings of the steps, and consequently by the hand-rail of a circular staircase.

When a part of a cylinder is cut off by a plane, the line of section will be a curved line upon the development, as is shewn in the lower part of the development, fig. 7. The faint lines shew the manner of finding the edge of the covering, and is the same as finding a mould for a soffit formed by an arch cutting obliquely into a straight wall.

14. In an oblique cone, the lines drawn on its surface, from its base to the vertex, would be of different lengths; and as those lengths are not shewn by the plan or elevation, they may be had by means of the principle stated in art. 6. To develope an oblique cone.

Let ABC, fig. 8, be the given cone, and AEB a plan of

Fig. 8.



[1] This has been shown by Dr C. Hutton, in his *Mathematical Tracts*, vol. i. p. 160.

half its base; to find the development, produce AB, and from the vertex C let fall the perpendicular CD. Divide the circumference of the base into any number of equal parts, and from each point of division describe an arc from D, as a centre, to cut the line AB at 1, 2, 3, &c. From C, as a centre, describe the arcs AA′, 11, 22, &c. and with a radius equal to one of the divisions of the circumference of the base, and the centre B cross the arc 55, which determines the point 5 in the development, with the same radius, and the point 5, as a centre cross the arc 44, and so on for the remainder of the arcs. Join A′C, and draw a curve line through the points A′, 1, 2, &c. which gives the covering for half an oblique cone.

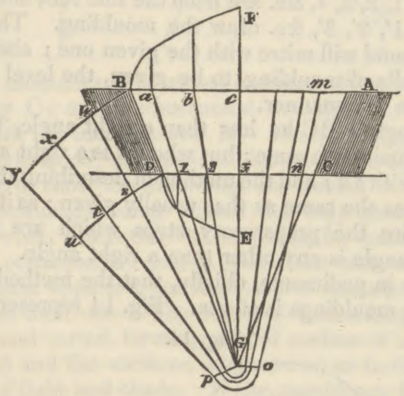
If the cone be cut by a plane, *a b*, parallel to the base, the surface B *b a′* A′ will be the covering of a soffit for a conical arch cutting obliquely into a straight wall.

find the ...ering of ...ffit.

15. As it often happens that there is not a sufficient space between the head of a door, or a window, and the cornice of the ceiling, to admit of the same bevel being preserved at the crown or top, as at the sides of the window; in such cases the soffit is made level at the crown, or with such an inclination only as will prevent the architrave cutting into the cornice of the room.

Let ABCD, fig. 9, be the plan of the space to be covered with a soffit, ED the arch of half the opening, which is

Fig. 9.



in its proper position when set perpendicularly over the line CD; and let F *c* be the height of the arch over AB. Produce AC and BD to meet at G; set off *c m* equal to *c* F, and 3 *n* equal to 3 E, then draw a line through the points *m n*, which will give the inclination of the soffit at the highest part of it. Divide the arch ED into any number of equal parts (in our example we have only divided it into three parts), and from each point of division let fall a perpendicular to CD, meeting the line CD in the points 1, 2. Through these points draw the lines G *a*, G *b*, cutting the line AB in the points *a b*, and from each point erect a perpendicular to AB. Set off, on 3 *n*, the heights of the points in the curve ED, and divide the line *m c* in the same proportion as *n* 3, which will give the corresponding heights for the arch FD, and through the points thus found the arch FD should be drawn.

Make G *o* perpendicular to GE, cutting a line passing through the points *m n* in *o*, and draw lines through the corresponding points of division in the lines *m c*, *n* 3, so that G *o* may be divided in the same proportion as *n* 3. Draw G *p* perpendicular to GD, and equal to G *o*, and set off upon it the same distances as are upon G *o*. Then, with a radius G 1, and the first division on G *p*, as a centre, describe an arc at *s*, and with a radius equal to one of the divisions of the arc ED and D as a centre, cross the arc *s*, which gives one point. Also, with a radius G 2, and the second division on G *p* as a centre, make an arc at *t*, which, being crossed by an arc described with a radius, equal to one of the divisions of the arc ED, and *s* as a centre, determines another point in the edge of the covering. Proceed in the same manner till half the development of one edge be completed; the other edge will be obtained by drawing lines through the points *s*, *t*, *u*, from the corresponding points in G *p*, and making *s w* equal to *a* 1; *t x* equal to *b* 2, &c.

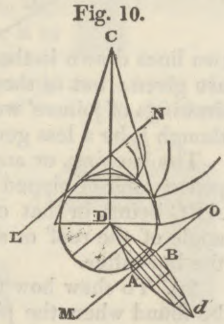
As both sides are the same, the soffit mould for one side requires only to be reversed for the other side. If the soffit be level at the crown, the process may be rendered shorter; but, where it is possible to get space for a slight inclination, the appearance of the soffit is always materially improved.

If the plan of the wall be circular, find the development of the arc ED as before, and transfer the distances from CD of the points in the curved wall, to the corresponding lines in the development, in the same manner as was done to find the edge B *w x y*.

16. The development of a sphere, or globe, can be effected only by an approximate process, as it is impossible to apply a plane surface so as to touch more than one point at a time; but various methods may be employed which are useful in forming spherical surfaces. To develope a sphere.

A sphere may be divided into numerous zones, the surface of each zone may be considered as that of the frustum of a cone, and developed in the same manner as has been described for a portion of a cone in art. 12. The upper part of fig. 10 shews half a sphere developed in this manner: and when it is divided into very narrow zones, the covering found by this process has some advantages, in practice, that are peculiar to it.

Fig. 10.



17. The surface of a sphere may also be developed by inscribing it in a cylinder, LMNO, fig. 10, and considering a small portion, or gore, ABD, to coincide with the surface of the cylinder. Then, if the portion ABD, considered as part of a cylinder, be developed by the process described in art. 13, one gore, AB *d* will be obtained; and by dividing the circumference of the sphere into any number of equal parts, and making AB equal to one of these parts, the same mould will serve for the whole of the sphere.

Another method of developing a sphere consists in supposing it to be a polyhedral, or many-sided figure; but this method has no advantage over the preceding ones, while it has the inaccuracies of both of them.

In lining and boarding domes, the position of the ribs to which the boards are to be fixed will determine the method of developement that ought to be adopted; but the form of the veneers for a spherical surface may be determined by either method.

To determine the Angle formed by two Inclined Planes.

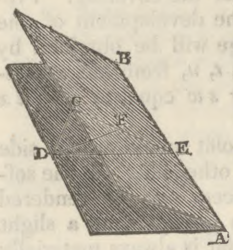
18. The angle made by two planes which cut one another, is the angle contained by two straight lines drawn from any, the same, point in the line of their common section, at right angles to that line; the one in the one plane, and the other in the other.[1] This angle is the same as that which the joiner takes with his bevel, the bevel being always applied so that its legs are square from the arris, or common section of the planes. To find the angle of planes inclined to one another.

[1] This is the definition given by Professor Playfair, in his *Elements of Geometry*, and it is better suited to our purpose than Euclid's definition.

Joinery.

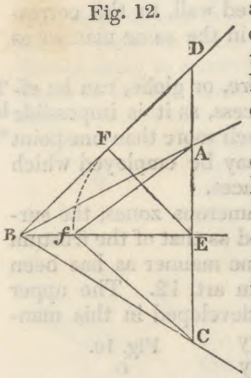
If two lines, AB and CD, be drawn upon a piece of pasteboard, at right angles to one another, crossing at the point E, and the pasteboard be cut half through, according to the line AB, so that it may turn upon that line as a joint; then, to whatever angle, CED, fig. 11, the parts may be turned, the lines EC and ED will be always in the same plane. Also, a line FD, drawn from any point D, in the line ED, to any point, F, in the line EC, will be always in the same plane. From these self-evident properties of planes, it is easy to determine the angle formed by any two planes, when two projections, or one projection and the development of the surfaces, are given.

Fig. 11.



19. Let ABC, fig. 12, be the plan of part of a pyramid, and BD the elevation of the arris, or line formed by the common section of the planes in respect to the line EB; EB being the projection of that arris upon the plan.

Fig. 12.



Draw AC perpendicular to EB, cutting it in any point E, and from E draw EF perpendicular to DB. With the radius EF, and centre E, cross EB in f, and join Af and fC, then the angle AfC is the angle formed by the planes of the pyramid.

The angle may be constructed when the plan and elevation of any two lines drawn in the planes, so as to intersect in the arris, are given; but as these projections are not often given in drawings of joiners' work, we have inserted the preceding, though it be a less general method.[1]

The backing, or angle for the back of hip-rafters in carpentry, and of hipped sky-lights, is found in this manner; ABC being, in that case, supposed to be the plan of an angle of the roof or sky-light, and DB the inclination of the hip-rafter.

20. To shew how the angle formed by two planes may be found when the plan and development are given, let it be required to find the angle contained by the two faces of a square pyramid, fig. 5.

Draw FB perpendicular to AC, and with the radius BF, and centre B, describe the arc FG. Then, with the radius DB, and centre F, cross the former arc in G, join BG, and FBG is the angle formed by two, the inclined faces of the pyramid.

Raking Mouldings.

Raking mouldings.

21. When an inclined or raking moulding is intended to join with a level moulding, at either an exterior or an interior angle, the form of the level moulding being given, it is necessary that the form of the inclined moulding should be determined, so that the corresponding parts of the surfaces of the two mouldings should meet in the same plane, this plane being the plane of the mitre. It may be otherwise expressed, by saying that the mouldings should mitre truly together.

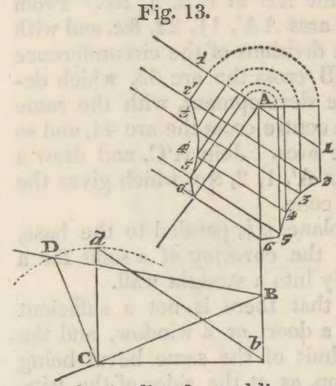
If the angle be a right angle, the method of finding the form of the inclined moulding is very easy; and as it is not very difficult for any other angle, it may perhaps be best to give a general method, and to illustrate it by examples of common occurrence.

General Method of describing a Raking Moulding, when the Angle and the Rake, or inclination of the Moulding, is given. Joinery

General method.

Let ABC, fig. 13, be the plan of the angle of a body, which is to have a level moulding on the side AB; and this level moulding is to mitre with an inclined moulding on the side BC. Also, let CBD be the angle the inclined moulding makes with a level or horizontal line BC.

Fig. 13.



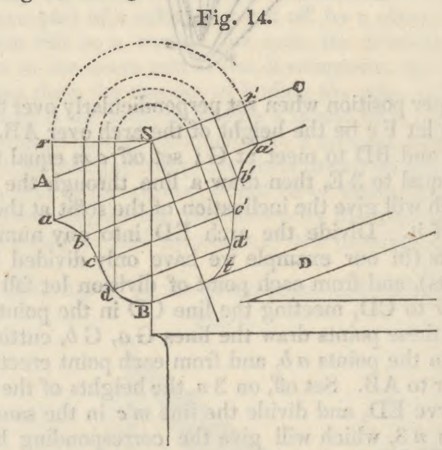
Produce AB, and draw Cb perpendicular to AB; also make DC perpendicular to BC, and dC perpendicular to bC. Set off Cd equal to CD, and join bd; then the inclined moulding must be drawn on lines parallel to bd.

Let 1, 2, 3, 4, &c. be any number of points in the given section of the level moulding; from each of these points draw a line parallel to bd, and draw $A6'$ perpendicular to bd. Set off the points $1'$, $2'$, $3'$, $4'$, &c. at the same distances respectively from the line $A6'$, as the corresponding points 1, 2, 3, 4, &c. are from the line AB, and through the points $1'$, $2'$, $3'$, &c. draw the moulding. The moulding thus found will mitre with the given one; also, supposing the inclined moulding to be given, the level one may be found in like manner.

If the angle ABC be less than a right angle, the whole process remains the same; but when it is a right angle, BD coincides with bd; and the method of describing the moulding becomes the same as that usually given; as it does not then require the preparatory steps which are necessary when the angle is any other than a right angle.

22. It is in pediments, chiefly, that the method of forming raking mouldings is of use. Fig. 14 represents part of a pediment; AB is that part of the level moulding which mitres with the inclined moulding; all that part of the cornice below B, being continued along the front, the lower members of the raking cornice stop upon it, and, therefore, do not require to be traced from the other. For pediments.

Fig. 14.



In that part of the cornice marked AB, set off a sufficient number of points; and from each of these points draw a line parallel to the rake, or inclination of the pediment. Also, let a verticle line be drawn to each of the same points from the horizontal line rs. Make $s't$ perpendicular to the inclination of the pediment, and with a slip of paper, or by

[1] On this subject the reader may consult Monge's *Géométrie Descriptive*, Art. 19 et 20, par. 23 and 24, 4th edition, Paris, 1820.

means of arcs of circles, transfer the distances on rs to the line $r's$, and from the points thus found, draw lines parallel to st; the intersection of these, with the inclined lines, will determine the form of the moulding, as is indicated by the letters.

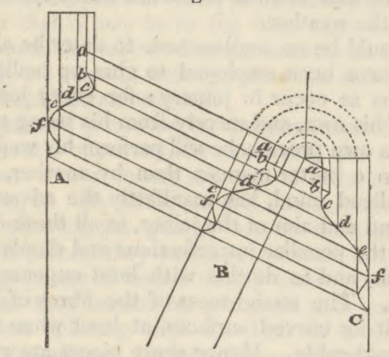
When a pediment has a cornice with modillions, the caps of the modillions require to be traced by the same method.

skirt-

23. It sometimes happens, that an inclined base-moulding has to mitre with a level one at an angle; and as the same thing occurs still more frequently with other moulding, such as cornices under the steps of stairs, &c. we shall give another example, which will serve still farther to illustrate the method of proceeding in such cases.

In fig. 15, a raking base-moulding is shewn, where the

Fig. 15.



inclined moulding B is traced to mitre with the horizontal moulding C; and the horizontal moulding A is traced to mitre with the inclined one B. The preceding examples being understood, the lines and letters in the figure will be sufficient to show the mouldings are traced.

arks ould-

24. Mouldings being almost the only part of modern joiners' work, which can, in strictness, be called ornamental, and consequently that in which the taste of the workman is most apparent, we shall offer a remark or two that may have their use. The form of a moulding should be distinct and varied, forming a bold outline of a succession of curved and flat surfaces, disposed so as to form distinct masses of light and shade. If the mouldings be of considerable length, a greater distinction of parts is necessary than in short ones.

Mouldings for the internal part of a building should not, however, have much projection; the proper degree of shade may always be given, with better effect, by deep sinkings judiciously disposed. The light in a room is not sufficiently strong to relieve mouldings, without resorting to this method; and hence it is that quirked mouldings are so much esteemed.

Sect. II.—On the Construction of Joiners' Work.

lifica- of a er.

25. The goodness of joiners' work depends chiefly upon the care that has been bestowed in joining the materials. In carpentry, framing owes its strength to the form and position of its parts; but in joinery, the strength of a frame depends upon the strength of the joinings. The importance, therefore, of fitting the joints together as accurately as possible, is obvious. It is very desirable, that a joiner should be a quick workman; but it is still more so that he should be a good one; that he should join his materials with firmness and accuracy; that he should make surfaces even and smooth, mouldings true and regular, and the parts intended to move so that they may be used with ease and freedom.

Where dispatch is considered as the chief excellence of a workman, it is not probable that he will strive to improve himself in his art, further than to produce the greatest quantity of barely tolerable work with the least quantity of labour. In some articles of short duration, dispatch in the manufacture may be of greater importance; but in works that ought to remain firm for years, it certainly is bad economy to spare a few shillings' worth of labour at the risk of being annoyed with a piece of bad work as long as it will hold together.

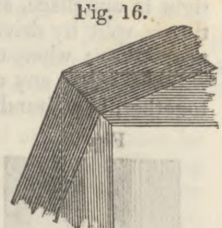
We have seen, with no small degree of pleasure, the effect of encouraging good workmanship in the construction of machinery, and would recommend that a like encouragement should be given to superior workmen in other arts.

Joining Angles.

On joining angles.

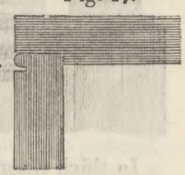
26. When the length of a joint at an angle is not considerable, it is sufficient to cut the joint, so that when the parts are joined, the plane of the joint shall bisect the angle. This kind of joint is shewn for two different angles, by fig. 16.

Fig. 16.



When an angle of considerable length is to be joined, and the kind of work does not require a joining should be concealed, fig. 17 is often employed; the small bead renders the appearance of the joint less objectionable, because any irregularities, from shrinkage, are not seen in the shade of the quirk of the bead.

Fig. 17.



A bead upon an angle, where the nature of the thing does not determine it to be an arris, is attended with many advantages; it is less liable to be injured, and admits of a secure joint, without the appearance of one. Fig. 18 shews

Fig. 18.

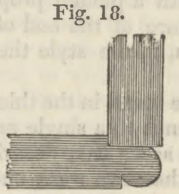


Fig. 19.

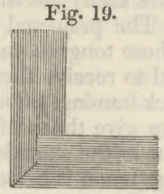

Fig. 20.

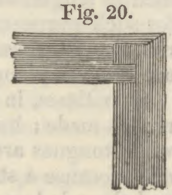
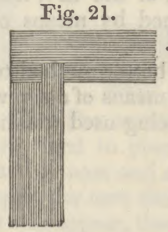


a joint of this description, which should always be used in passages.

Fig. 19 represents a very good joint for an exterior angle, whether it be a long or short one. Such a joint may be nailed both ways. But the joint represented by fig. 20 is superior to it; the parts being drawn together by the form of the joint itself, they can be fitted with more accuracy, and joined with certainty. The angles of pilasters are often joined, as fig. 20.

Interior angles are commonly joined, as shewn by fig. 21.

Fig. 21.



If the upper or lower edge be visible, the joint is mitred, as in fig. 16, at the edge only, the other part of the joint being grooved, as in fig. 21. In this manner are put together the skirting and dado at the interior angles of rooms, the backs, and backlinings of windows, the jambs of door-ways, and various other parts of joiners' work.

Framing.

The object of framing.

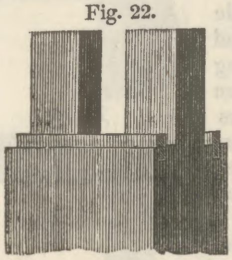
27. Frames in joinery are usually connected by mortise tenon joints, with gooves to receive pannels. Doors, window-shutters, &c. are framed in this manner. The object in framing is, to reduce the wood into narrow pieces, so that the work may not be sensibly affected by its shrink-

age; and, at the same time, it enables us to vary the surface without much labour.

From this view of the subject, the joiner will readily perceive, that neither the parts of the frame nor the pannels should be wide. And as the frame should be composed of narrow pieces, it follows, that the pannels should not be very long, otherwise the frame will want strength. The pannels of framing should not be more than 15 inches wide, and 4 feet long, and pannels so large as this should be avoided as much as possible.[1] The width of the framing is commonly about one-third of the width of the pannel.

It is of the utmost importance, in framing, that the tenons and mortises should be truly made. After a mortise has been made with the mortise chisel, it should be rendered perfectly even with a float; an instrument which differs from a single cut, or float file, only by having larger teeth. An inexperienced workman often makes his work fit too tight in one place, and too easy in another, hence the mortise is split by driving the parts together, and the work is never firm; whereas if the tenon fill the mortise equally, without using any considerable force in driving the work together, is is found to be firm and sound. The thickness of tenons should be about one-fourth of that of the framing, and the width of a tenon should never exceed about five times its thickness, otherwise, in wedging, the tenon will become bent, and bulge out of the sides of the mortise. If the rail be wide, two mortises should be made, with a space of solid wood between; fig. 22 shews the tenons for a wide rail.

Fig. 22.



In thick framing, the strength and firmness of the joint is much increased by putting a cross or feather tongue in on each side of the tenon; these tongues are about an inch in length, and are easily put in with a plough proper for such purposes. The projected figure of the end of a rail, fig. 22, shews these tongues put in, in the style there are grooves ploughed to receive them.

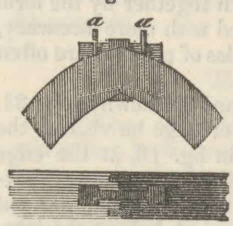
Sometimes, in thick framing, a double tenon in the thickness is made; but we give the preference to a single one, when tongues are put in the shoulders, as we have described; because a strong tenon is better than two weak ones, and there is less difficulty in fitting one than two.

The pannels of framing should be made to fill the grooves, so as not to rattle, and yet to allow the pannels to shrink without splitting.

Joining curved pieces.

28. When a frame consists of curved pieces, they are often joined by means of pieces of hard wood called keys. Fig 23 is the head of a Gothic window frame, joined with a key, with a plan of the joint below it. A cross tongue is put in on each side of the key, and the joint is tightened by means of the wedges *aa*.

Fig. 23.



It is, however, a better method to join such pieces by means of a screw bolt instead of a key, the cross tongues being used whichever method is adopted.

Joining with Glue.

Joining with glue.

29. It is seldom possible to procure boards sufficiently wide for pannels without a joint, on account of heart shakes, which open in drying. In cutting out pannels, for good work, shaken wood should be carefully avoided. That part near the pith is generally the most defective.

If the pannels be thick enough to admit of a cross or feather tongue in the joint, one should always be inserted, for then, if the joint should fail, the surfaces will be kept even, and it will prevent light passing through.

Sometimes plane surfaces of considerable width and length are introduced in joiners' work, as in dado, window backs, &c.; such surfaces are commonly formed of inch, or inch and quarter, boards joined with glue, and a cross or feather tongue ploughed into each joint. When the boards are glued together, and have become dry, tapering pieces of wood, called keys, are grooved in, across the back, with a dovetail groove. These keys preserve the surface straight, and also allow it to shrink and expand with the changes of the weather.

Glueing curved work.

30. It would be an endless task to describe all the methods that have been employed to glue up bodies of such varied forms as occur in joinery; for every joiner forms methods of his own, and merely from his being most familiar with his own process, he will perform his work, according to it, in a better manner than by another, which, to an unprejudiced mind, has manifestly the advantage over it. The end and aim of the joiner, in all these operations, is to avoid the peculiar imperfections and disadvantages of his materials, and to do this with least expense of labour or material. The straightness of the fibres of wood renders it unfit for curved surfaces, at least when the curvature is considerable. Hence short pieces are glued together as nearly in the form desired as can be, and the apparent surface is covered with a thin veneer; or the work is glued up in pieces that are thin enough to bend to the required form. Sometimes a thin piece of wood is bent to the required form upon a cylinder or saddle, and blocks are jointed and glued upon the back; when the whole is completetely dry it will preserve the form that had been given to it by the cylinder.

To determine the thickness of the pieces to glued together.

The proper thickness for the pieces to be bent may be easily determined by an easy experiment on a piece of the same kind of wood. Thus, select a piece of wood, of the same kind as that to be used, and bend it as much as it will bear without injury; then ascertain the radius of curvature, and also the thickness of the piece, at the most curved part of it. From these data the proper thickness for any other curve will be determined by the following proportion:

As the radius of curvature, found by experiment, is to the thickness of the piece tried; so is the radius of any other curve to the thickness of the piece that may be bent into it.[2]

For example, we have found that a piece of straight grained white deal, of an inch in thickness, may be bent, without injury, into a curve of which the radius is 120 inches, therefore, $120 : 1 :: \text{radius} : \text{thickness} = \frac{\text{radius}}{120}$. That is, a piece of deal of the same quality may be bent into any curve, of which the radius is not less than 120 times its thickness.

A piece of work glued up in thicknesses should be very well done; but it too often happens that the joints are visible, irregular, and in some places open; therefore other methods have been tried.

Bending by steam or boiling.

31. If a piece of wood be boiled in water for a certain time, then taken out and immediately bent into any particular form, and it be retained in that form till it be dry, a

[1] Pannels of external doors and shutters may be rendered more secure by boring them, and inserting iron wires. See *Trans. of the Society of Arts*, vol. xxv. p. 106.

[2] The reader will find some interesting propositions relating to fixture in the Article CARPENTRY, p. 624, vol. ii.

permanent change takes place in the mechanical relations of its parts; so that though, when relieved, it will spring back a little, yet it will not return to its natural form.

The same effect may be produced by steaming wood; but though both these methods have been long practised to a considerable extent in the art of ship-building, we are not aware that any general principles have been discovered, either by experiment or otherwise, that will enable us to apply it to an art like joinery, where so much precision is required. We are not aware that it has been tried; but, before it can be rendered extensively useful, the relation between the curvature to which it is bent, and that which it assumes, when relieved, should be determined, and also the degree of curvature which may be given to a piece of a given thickness.

The time that a piece of wood should be boiled, or steamed, in order that it may be in the best state for bending, should be made the subject of experiments; and this being determined, the relation between the time and the bulk of the piece should be ascertained.

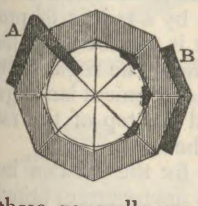
For the joiner's purposes, we imagine, that the process might be greatly improved, by saturating the convex side of each piece with a strong solution of glue, immediately after bending it. By filling, in this manner, the extended pores, and allowing the glue to harden thoroughly before relieving the pieces, they would retain their shape better.

Gl ngup wo n col ns.

32. Large pieces of timber should never be used in joinery, because they cannot be procured sufficiently dry to prevent them splitting with the heat of a warm room. Therefore, the external part of columns, pilasters, and works of a like kind, should be formed of thin pieces of dry wood; and, if support be required, a post, or an iron pillar, may be placed within the exterior column. Thus, to form columns of wood, so that they shall not be liable to split, narrow pieces of wood are used, not exceeding five inches in width. These are jointed like the staves of a cask, and glued together, with short blocks glued along at each joint.

Fig. 24 is a plan of the lower end of a column glued up in staves; the bevel at A is used for forming the staves, that at B is used for adjusting them when they are glued together. A similar plan must be made for the upper end of the column, which will give the width of the upper end of the staves. The bevels taken from the plan, as at A and B, are not the true bevels; but they are those generally used, and are very nearly true, when the columns are not much diminished. To find the true bevels, the principle we have given in art. 19 should be applied. The same method may be adopted for forming large pillars for tables, &c.

Fig. 24.



If a column have flutes, with fillets, the joints should be in the fillets, in order to make the column as strong as possible; also, if a column be intended to have a swell in the middle, proper thickness of wood should be allowed for it.

Sm co- lun , ta- ble rs, &c.

When columns or pillars are small, they may be made of dry wood; and to secure them against splitting, a hole may be bored down the axis of each column.

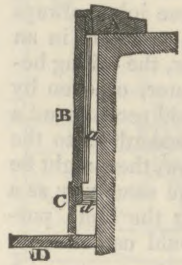
Fixing Joiners' Work.

Fix g wo co- get .

33. We have hitherto confined our remarks to that part of joinery which is performed at the bench; but by far the most important part remains to be considered. For, however well a piece of work may have been prepared, if it be not properly fixed, it cannot fulfil its intended purpose. As in the preceding part, we shall state the general principles that ought to be made the basis of practice, and illustrate those principles by particular examples.

If the part to be fixed consist of boards jointed together, but not framed, it should be fixed so that it may shrink, or swell without splitting. The nature of the work will generally determine how this may be effected. Let us suppose that a plain back of a window is to be fixed. Fig 25 is a section shewing B the back of the window, A the window-sill, D the floor, and C the skirting. The back is supposed to be prepared, as we have stated in art. 29, and that it is kept straight by a dovetailed key *a*. Now, let the back be firmly nailed to the window-sill A, and let a narrow piece *d*, with a groove, and cross tongue, in its upper edge, be fixed to bond timbers or plugs in the wall; the tongue being inserted also into a corresponding groove in the lower edge of the back of B. It is obvious, that the tongue being loose, the back B may contract or expand, as a pannel in a frame. The dado of a room should be fixed in the same manner. In the principal rooms of a house, the skirting C is usually grooved into the floor D, and fixed only to the narrow piece *d*, which is called a ground. By fixing, in this manner, the skirting covers, the joint, which would otherwise soon be open by the shrinking of the back, and from the skirting being grooved into the floor, but not fastened to it, there cannot be an open joint between the skirting and floor. When it is considered, that an open joint, in such a situation, must become a receptacle for dust, and a harbour for insects, the importance of adopting this method of fixing skirting will be apparent.

Fig. 25.



Fixing skirting for rooms.

In fixing any board above five or six inches wide, similar precautions are necessary; otherwise it is certain to split when the house becomes inhabited. We may, in general, either fix one edge, and groove the other, so as to leave it at liberty, or fix it in the middle, and leave both edges at liberty.

Sometimes a wide board, or a piece consisting of several boards, may be fixed by means of buttons, screwed to the back, which turn into grooves in the framing, bearers, or joists, to which it is to be fixed. If any shrinking takes place the buttons slide in the grooves. In this manner the landing of stairs are fixed, and it is much the best mode of fixing the top of a table to its frame.

Fixing landing of stairs, tops of tables, &c.

34. The extension of the principle of ploughing and tonguing work together is one of the most important of the improvements that have been introduced by modern joiners. It is an easy, simple, and effectual method of combination, and one that provides against the greatest defect of timber work, its shrinkage. By means of this method, the bold mouldings of Gothic architecture can be executed with a comparatively small quantity of material; and even in the mouldings of modern architecture it saves much labour. For example, the moulded part of an architrave may be joined with the plain part, as shewn by fig. 26. If this method be compared with the old method of glueing one piece upon another, its advantage will be more evident.

Forming archi- traves, &c.

Fig. 26.

33. The architraves, skirtings, and surbase mouldings, are fixed to pieces of wool called *grounds;* and as the straightness and accuracy of these mouldings must depend upon the care that has been taken to fix the grounds truly; it will appear, that fixing grounds, which is a part often left to inferior workmen, in reality requires much skill and attention; besides, they are almost always the guide for the plasterer. Where the plasterer's work joins the grounds, they should have a small groove ploughed in the edge to form a key for the plaster.

Fixing grounds.

36. In our remarks on construction, we must not omit to say a few words on laying floors, because it will give us

Laying floors.

Joinery.

an opportunity of pointing out a defect which might be easily remedied. The advice of Evelyn, to tack the boards down only the first year, and nail them down for good the next, is certainly the best, when it is convenient to adopt it; but, as this is very seldom the case, we must expect the joints to open more or less. Now these joints always admit a considerable current of cold air, and also, in an upper room, unless there be a counter floor, the ceiling below may be spoiled by spilling a little water, or even by washing the floor. To avoid this, we would recommend a tongue to be ploughed into each joint, according to the old practice. When the boards are narrow, they might be laid without any appearance of nails, in the same way as a dowelled floor is laid, the tongue serving the same purpose as the dowels. In this case we would use cross or feather tongues for the joints.

Folding floors censured.

There is a method sometimes used in laying floors, which workmen call folding; according to this method, two boards are laid, and nailed at such a distance apart, that the space is a little less than the aggregate width of the boards intended for it; these boards are then put to their places, and, on account of the narrowness of the space left for them, they rise like an arch between its abutments. The workmen force them down by jumping upon them. Accordingly, the boards are never soundly fixed to the joists, nor can the floor be laid with any kind of evenness or accuracy. We merely notice this method here, in order that it may be avoided.

Heading joints.

As boards can seldom be got long enough to do without

Fig. 27.

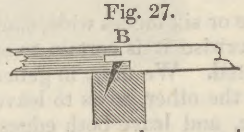


Fig. 28.

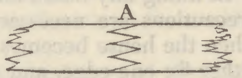

joints, it is usual, except in very inferior work, to join the ends with a tongued joint, as shewn in fig. 27, where B is the joist. The etched board is first laid, and nailed to the joist.

In oak floors, the ends are forked together sometimes, as shewn at A, fig. 28, in order to render the joints less conspicuous.

The joints should be kept as distant from one another as possible.

Hinging.

Hinging.

37. It requires a considerable degree of care to hang a door, a shutter, or any other piece of work in the best manner. In the hinge, the pin should be perfectly straight, and truly cylindrical, and the parts accurately fitted together.

The hinges should be placed so that their axes may be in the same straight line, as any defect in this respect will produce a considerable strain upon the hinges every time the hanging part is moved, which prevents it from moving freely, and is injurious to the hinges.

In hanging doors, centres are often used instead of hinges; but, on account of the small quantity of friction in centres, a door moves too easily, or so that a slight draft of air accelerates it so much in falling to, that it shakes the building, and is disagreeable. We have seen this in some degree remedied by placing a small spring to receive the shock of the door.

The greatest difficulty, in hanging doors, is to make them to clear a carpet, and be close at the bottom when shut. To do this, that part of the floor which is under the door, when shut, may be made to rise above a quarter of an inch above the general level of the floor; which, with placing the hinges so as to cause the door to rise as it opens, will be sufficient, unless the carpet should be a very thick one. Several mechanical contrivances have been used for either raising the door, or adding a part to spring close to the floor as the door shuts. The latter is much the better method. The reader who may be desirous of examining this method, may consult the *Transactions of the Society of Arts*, (vol. xxvi. p. 196.)

38. Various kinds of hinges are in use. Sometimes they are concealed, as in the kind of joints called rule joints; others project, and are intended to let a door fold back over projecting mouldings, as in pulpit doors. When hinges project, the weight of the door acts with an increased leverage upon them, and they soon get out of order, unless they be strong and well fixed.

Room doors.

The door of a room should be hung so that, in opening the door, the interior of the room cannot be seen through the joint. This may be done by making the joint according to fig. 29. The bead should be continued round the door, and a common but-hinge answers for it.

The proper bevel for joints of door.

The proper bevel for the edge of a door or sash may be

Fig. 29.

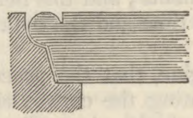

Fig. 30.

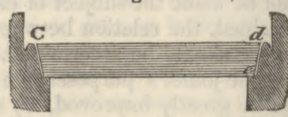

found by drawing a line from the centre of motion C, fig. 30, to *e*, the interior angle of the rebate, draw *ed* perpendicular to C*e*, which gives the bevel required. In practice, the bevel is usually made less, leaving an open space in the joint when the door is shut; this is done on account of the interior angle of the rebate often being filled with paint.

Stairs.

Stairs.

39. The construction of stairs is generally considered the highest department of the art of joinery, therefore we treat of it under a distinct head.

The principal object to be attended to in stairs is, that they afford a safe and easy communication between floors of different levels. The strength of a stair ought to be apparent as well as real, in order that those who ascend it may feel conscious of safety. In order to make the communication safe, it should be guarded by a railing of proper height and strength; in order that it may be easy, the rise and width, or tread, of the steps should be regular and justly proportioned to each other, with convenient landings; there should be no winding steps, and the top of the rail should be of a convenient height for the hand.

Proper proportion for stairs.

The first person that attempted to fix the relation between the height and width of a step, upon correct principles, was, we believe, Blondel, in his *Cours d'Architecture.* If a person walking upon a level plane move over a space, P, at each step, and the height which the same person could ascend vertically, with equal ease, were H; then, if h be the height of a step, and p its width; the relation between p and h must be such, that when $p = P$, $h = o$; and when $H = h$, $p = o$. These conditions are satisfied by an equation of the form $h = H\left(1 - \frac{p}{P}\right)$. Blondel assumes 24 inches for the value of P, and 12 inches for that of H; substituting these values in our equation, it becomes $h = \frac{1}{2}(24 - p)$, which is precisely Blondel's rule. We do not think these the true values of P and H; indeed, it would be difficult to ascertain them; but they are so near, and agree so well with our observations on stairs of easy ascent, that they may be taken for the elements of a practical rule. Hence, according as h or p is given, we have

$$h = \frac{1}{2}(24 - p, \text{ or } p = 24 - 2h.$$

Thus, if the height of a step be six inches, then 24 — 12 = 12, the width or tread for a step that rises six inches.

40. The forms of staircases are various. In towns, where

Joinery. Different kinds of stairs.

space cannot be allowed for convenient forms, they are often made triangular, circular, or elliptical, with winding steps, or of a mixed form, with straight sides and circular ends. In large mansions, and in other situations, where convenience and beauty are the chief objects of attention, winding steps are never introduced when it is possible to avoid them. Good stairs, therefore, require less geometrical skill than those of an inferior character.

The best architectural effect is produced by rectangular staircases, with ornamented railing and newels. In Gothic structures scarcely any other kind can be adopted, with propriety, for a principal staircase. Modern architecture admits of greater latitude in this respect; the end of the staircase being sometimes circular, and the hand-rail continued, beginning either from a scroll or a newel.

Rectangular staircases.

41. When a rectangular staircase has a continued rail, it is necessary that it should be curved so as to change gradually from a level to an inclined direction. This curvature is called the *ramp* of the rail. The plan of a staircase of this kind is represented by ABCD, fig. 31, and fig. 32 shews a section of it, supposing it to be cut through at ab, on the plan.

Fig. 31.

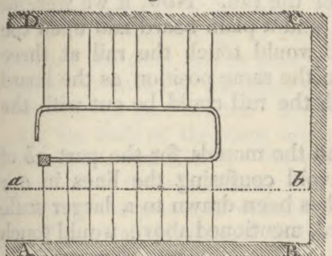

Fig. 32.

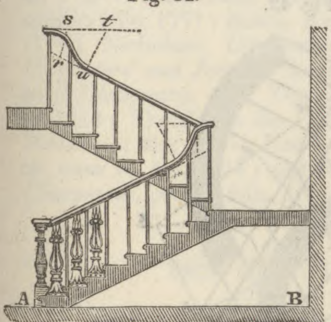


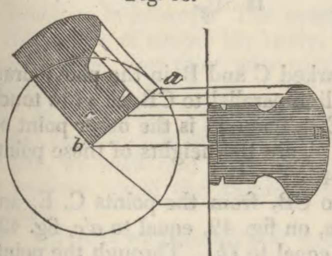
To find the cap of newel.

The hand-rail is supposed to begin with a newel at the bottom, and the form of the cap of the newel ought to be determined, so that it will mitre with the hand-rail. Let H, fig. 33, be the section of the hand-rail, and ab the radius of the newel; then the form of the cap may be traced at C by the method we have already described. (Art. 9 and 10.)

Height for rail, &c.

The sections of hand-rails are of various shapes; some of the most common ones are too small; a hand-rail should never be less than would require a square, of which the side is $2\frac{1}{2}$ inches, to circumscribe it.

Fig. 33.



For the level landings of a staircase the height of the top of the hand-rail should be about 40 inches, and in any part of the inclined rail the height of its upper side above the middle of the width of the step should be 40 inches less the rise of one step, when measured in a vertical direction.

To describe the ramps.

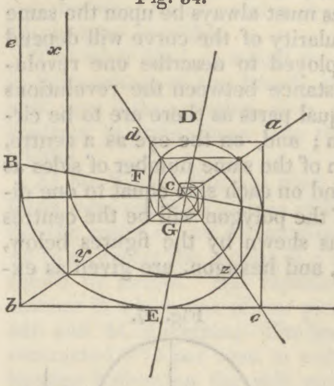
To describe the ramps, let rs be a vertical line drawn through the middle of the width of the step, fig. 32; set ru equal to rs, and draw ut at right angles with the back of the rail, cutting the horizontal line st in t. From the point t, as a centre, describe the curve of the rail. When there is a contrary flexure, as in the case before us, the method of describing the lesser curve is the same.

To draw the logarithmic spiral.

42. The hand-rail of a stair often begins from a scroll; and that kind of spiral which is called the logarithmic spiral, has been proposed as the best for the purpose. It is shewn by writers on curve lines, that any radial lines drawn from the centre will be cut by the logarithmic spiral in one and the same angle. By means of this property of the curve, it may be described as follows:

Let C be the centre, fig. 34, and draw AB perpendicular to DE, crossing it in C. Bisect the angles by the lines ab, cd. Draw eBb to cut CB at the angle proposed for the curve, and to meet Cb in b; draw cb perpendicular to be, cutting Cc in c; draw ca perpendicular to cb cutting Ca in a; and proceed round with as many revolutions as may be required in the same manner. Then B, E, A, D, F, G, &c. are points in the curve, and the lines eb, cb, ca, ad, &c. are tangents to the curves at these points. Therefore, the curve may be either drawn by hand, or by means of circular arcs. Also, any number of interior or exterior spirals may be drawn by drawing lines parallel to the tangents, as xy, yz, &c.

Fig. 34.

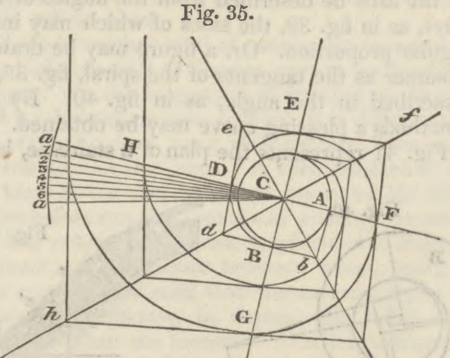


If eb were to cross BC at a right angle, the curve would be a circle.

43. The scrolls and volutes used in architecture are always made to terminate in a circle at the centre; consequently none of the curves described by mathematicians are adapted for these purposes. But the construction we have employed for the logarithmic spiral readily leads to a species of spiral that appears well suited for scrolls or volutes. In the logarithmic spiral the angle of the curve is constant; but imagine the angle to change regularly, and to become a right angle at the point where the circle called the eye begins. This would afford us a regular and pleasing curve, unfolding itself from a circle in the centre. This curve might be called the Architectural Spiral. A new spiral proposed for volutes, scrolls, &c.

Let C be the centre, fig. 35, and round this centre describe a circle for the eye of the scroll, or volute. Divide this circle into eight equal parts, and draw lines from the centre through the points of division.

Fig. 35.



With any radius aC, and C as a centre, describe the arc ac, and upon this arc set off any number of equal divisions. The extent of a division must be regulated by the quantity the curve may unfold at each revolution, and the number depends on the number of revolutions.

Then, beginning at A, draw Ab perpendicular to Ca; db parallel to C′; de perpendicular to C2; ef parallel to C3; and so on for any number of revolutions. The points A, B, D, E, F, G, and H, in the curve, and the tangents to these points, are found; therefore the curve may be described by hand, or by means of circular arcs.

The tangents to any interior or exterior spiral will be parallel to the ones first found, and, therefore, any number may be drawn with the greatest facility.

Joinery.

Neither the logarithmic nor the architectural spiral can be drawn truly by circular arcs; but we shall here point out the principle by which such spirals may be drawn. When a spiral is drawn by means of circular arcs only, the centres of the adjoining arcs must always be upon the same straight line; and the regularity of the curve will depend on the number of arcs employed to describe one revolution. Let the proposed distance between the revolutions be divided into as many equal parts as there are to be circular arcs in one revolution; and, on the eye as a centre, construct a regular polygon of the same number of sides as the number of divisions, and on each side equal to one division. Then the angles of the polygon will be the centres for describing the spiral, as shewn by the figures below, where the triangle, square, and hexagon, are given as examples:

Fig. 36.

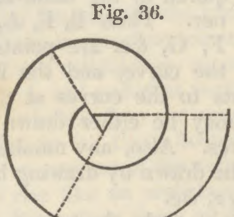


Fig. 37.

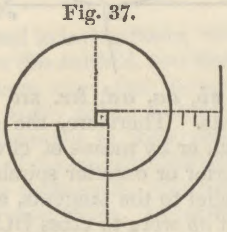

Fig. 38.

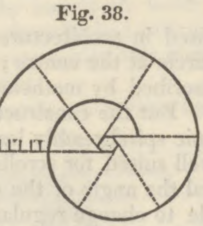

Fig. 39.

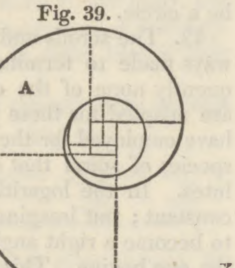

If a spiral be drawn to begin from a circle at the centre, let the arcs be described from the angles of a rectangular fret, as in fig. 39, the sides of which may increase in any regular proportion. Or, a figure may be drawn in the same manner as the tangents of the spiral, fig. 35, and the arcs described in the angle, as in fig. 40. By either of these methods a pleasing curve may be obtained.

Staircase with circular ended well-hole.

44. Fig. 41 represents the plan of a staircase, beginning

Fig. 40.

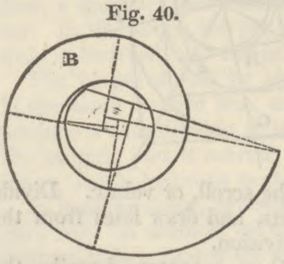

Fig. 43.

Fig. 41.

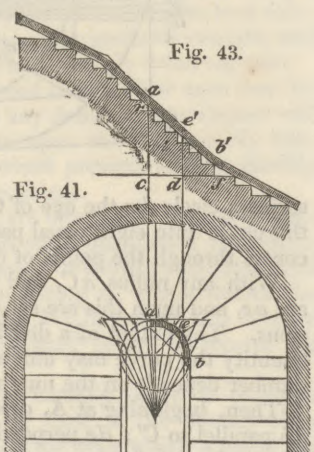

Fig. 44.

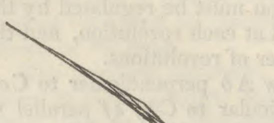


with a scroll, and having steps winding round the circular part of the well-hole.

In the first place, let the end of the steps be developed according to the method we have given in Art. 13. Fig. 43 shews this development. Now, the hand-rail ought to follow the inclination of a line drawn to touch the nosings of the steps, except where there is an abrupt transition from the rake of the winding to that of the other steps; at such places it must be curved; the curve may be drawn by the help of intersecting lines, as in fig. 44, if the workman cannot trust to his eye.

Development of circular part.

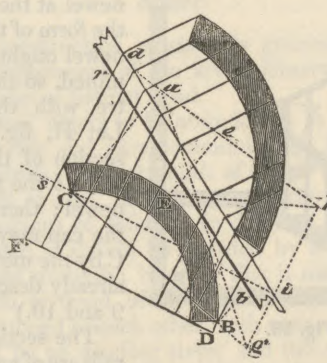
The part which is shaded in fig. 43, represents the hand-rail and ends of the steps, when spread out, and the hand-rail is only drawn close to the steps for convenience, as it would require too much space to raise it to its proper position. This development of the rail is called the falling mould.

The wood used for hand-rails being of an expensive kind, it becomes of some importance to consider how the plank may be cut so as to require the least quantity of material for the curved part of the rail. Now, if we were to suppose the rail executed, and a plain board laid upon the upper side of it, the board would touch the rail at three points; and a plank laid in the same position as the board would be that out of which the rail could be cut with the least waste of material.

To find the face moulds.

Let it be required to find the moulds for the part ab of the rail, fig. 41, and to avoid confusing the lines in our small figure, the part ab has been drawn to a larger scale in fig. 42. The plain board, mentioned above, would touch

Fig. 42.



the rail at the points marked C and B in the plan; draw the line CB, and draw a line parallel to CB, so as to touch the curve at the point E. Then E is the other point on the plan; and a', e', and b', are the heights of these points in the development, fig. 43.

Erect perpendiculars to CB, from the points C, E, and B, fig. 42, and set off Ca, on fig. 42, equal to $a'c$, fig. 43; Ee equal to de', and Bb equal to fb. Through the points C and E, draw the dotted line Ch; through ae draw a line to meet CE in h; and through the points ab, draw a line to meet CB in g; then join hg, and make Ci perpendicular to hg.

Now, if Cd be equal to Ca, and perpendicular to Ci; and di be joined, it will be the angle which the plank makes with the horizontal plane, or plan. Therefore, draw FD parallel to Ci, and find the section by the process described in Art. 10. This section is the same thing as would be obtained by projecting vertical lines from each point in the hand-rail against the surface of a board, laid to touch it in three points. The inexperienced workman will be much assisted in applying the moulds if he acquires a clear notion of the position when executed.

To find the thickness of the plank.

To find the thickness of the plank, take the height to the under side of the rail cr in the development, fig. 43, and set it off from s, in the line Ci, to r, in fig. 42; from the pla-

Joinery.

the point r draw a line parallel to di, and the distance between those parallel lines will be the thickness of the plank.

The mould, fig. 42, which is traced from the plan, is called the *face mould*. It is applied to the upper surface of the plank, which being marked, a bevel should be set to the angle idC, and this bevel being applied to the edge will give the points to which the mould must be placed to mark out the under side. It is then to be sawn out, and wrought true to the mould. In applying the bevel, care should be taken to let its stock be parallel to the line di, if the plank should not be sufficiently wide for di to be its arris.

After the rail is truly wrought to the face mould, the falling mould, fig. 43, being applied to its convex side, will give the edge of the upper surface, and the surface itself will be formed by squaring from the convex side, holding the stock of the square always so that it would be vertical if the rail were in its proper situation. The lower surface is to be parallel to the upper one.

The sudden change of the width of the ends of the steps causes the soffit line to have a broken or irregular appearance; to avoid it, the steps are made begin to wind before the curved part begins. Different methods of proportioning the ends of the steps are given by Nicholson, Roubo, Rondelet, and Krafft. We cannot in this place enter into a detail of these methods, but for the reader's information a list of the principal writers on staircases is subjoined.

Price, in his *British Carpenter*, 4to, 1735; Langley, *Builders' Complete Assistant*, 8vo, 1738; Frezier, *Coupe des Pierres et des Bois*, 4to, 1739; Roubo, *L'Art du Menuisier*, folio, 1771; Skaife, *Key to Civil Architecture*, 8vo, 1774; Nicholson, *Carpenters' New Guide*, 4to, 1792; *Carpenters' and Joiners' Assistant*, 4to, 1792; *Architectural Dictionary*, 4to; *Transactions Society of Arts*, &c. for 1814; *Treatise on the Construction of Staircases and Handrails*, 4to, 1820; Rondelet, *Traité de l'Art de Bâtir*, tome iv. 4to, 1814; and Krafft, *Traité sur l'Art de la Charpenter*, part ii. folio, 1820.

Sect. III.—On Materials.

45. There is no art in which it is required that the structure and properties of wood should be so thoroughly understood as in joinery. The practical joiner, who has made the nature of timber his study, has always a most decided advantage over those who have neglected this most important part of the art.

In the article Anatomy, Vegetable (vol. iii. p. 61 and 82), the structure of wood is described; in this place, therefore, we shall only show how the joiner may, in a great measure, avoid the warping caused by its irregular texture.

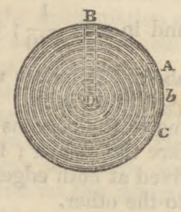
46. It is well known that wood contracts less in proportion, in diameter, than it does in circumference; hence a whole tree always splits in drying. Mr Knight has shown that, in consequence of this irregular contraction, a board may be cut from a tree that can scarcely be made, by any means, to retain the same form and position when subjected to various degrees of heat and moisture. From the ash and the beech he cut some thin boards, in different directions relatively to their transverse septa, so that the septa crossed the middle of some of the boards at right angles, and lay nearly parallel with the surfaces of others. Both kinds were placed in a warm room, under perfectly similar circumstances. Those which had been formed by cutting across the transverse septa, as at A in fig. 44, soon changed their form very considerably, the one side becoming hollow, and the other round; and in drying, they contracted nearly 14 per cent. in width.

Difference in shrinkage.

The other kind, in which the septa were nearly parallel to the surfaces of the boards, as at B in fig. 44, retained, with very little variation, their primary form, and did not contract in drying more than three and a half per cent. in width.[1]

As Mr Knight had not tried resinous woods, two specimens were cut from a piece of Memel timber; and, to render the result of our observation more clear, conceive fig. 45 to represent the section of a tree, the annual rings being shewn by circles. BD represents the manner in which one of our pieces was cut, and AC the other. The board AC contracted 3·75 per cent. in width, and became hollow on the side marked b. The board BD retained its original straightness, and contracted only 0·7 per cent. The difference in the quantity of contraction is still greater than in hard woods.

Fig. 45.



From these experiments, the advantages to be obtained merely by a proper attention in cutting out boards for pannels, &c. will be obvious; and it will also be found that pannels cut so that the septa are nearly parallel to their faces, will appear of a finer and more even grain, and require less labour to make their surfaces even and smooth.

The results of these experiments are not less interesting to cabinet-makers, particularly in the construction of billiard-tables, card-tables, and indeed every kind of table in use. For such purposes, the planks should be cut so as to cross the rings as nearly in the direction BD as possible. We have no doubt that it is the knowledge of this property of wood that renders the billiard-tables of some makers so far superior to those of others.

In wood that has the larger transverse septa, as the oak, for example, boards cut as BD will be figured, while those cut as AC will be plain.

Cause of pieces curving in the direction of their length.

47. There is another kind of contraction in wood whilst drying, which causes it to become curved in the direction of its length. In the long styles of framing we have often observed it; indeed, on this account, it is difficult to prevent the style of a door, hung with centres, from curving, so as to rub against the jamb. A very satisfactory reason for this kind of curving has been given by Mr Knight,[2] which also points out the manner of cutting out wood, so as to be less subject to this defect, which it is most desirable to avoid. The interior layers of wood, being older, are more compact and solid than the exterior layers of the same tree; consequently, in drying, the latter contract more in length than the former. This irregularity of contraction causes the wood to curve in the direction of its length, and it may be avoided by cutting the wood so that the parts of each piece shall be as nearly of the same age as possible.

Changes produced by the weather.

48. Besides the contraction which takes place in drying, wood undergoes a considerable change in bulk with the variations of the atmosphere. In straight-grained woods the change in length is nearly insensible;[3] hence they are sometimes employed for pendulum rods; but the lateral dimensions vary so much, that a wide piece of wood will serve as a rude hygrometer.[4] The extent of variation de-

[2] *Ibid.*

[3] Mr Ramsden and General Roy made some experiments on the expansion in length. See *Account of the Trig. Survey*, vol i. p. 46 and 49.

[4] See *Phil. Trans.* Lowthorpe's Abridg. vol. ii. p. 37.

Joint || Jolloxochitl.

creases in a few seasons, but it is of some importance to the joiner to be aware, that even in very old wood, when the surface is removed, the extent of variation is nearly the same as in new wood.

It appears, from Rondelet's experiments,[1] that in wood of a mean degree of dryness, the extent of contraction and expansion, produced by the usual changes in the state of the atmosphere, was,

$$\text{in fir wood, from } \frac{1}{360} \text{ to } \frac{1}{75} \text{ part of its width;}$$

$$\text{and, in oak, from } \frac{1}{412} \text{ to } \frac{1}{84} \text{ part of its width.}$$

Consequently, the mean extent of variation in fir is $\frac{1}{124}$, and in oak, $\frac{1}{140}$; and, at this mean rate, in a fir board about $12\frac{1}{2}$ inches wide, the difference in width would be $\frac{1}{10}$th of an inch. This will show the importance of attending to the maxims of construction we have already laid before the reader; for, if a board of that width should be fixed at both edges, it must unavoidably split from one end to the other.

Kinds of wood.

49. The kinds of wood commonly employed in joinery are, the oak, the different species of pine, mahogany, lime-tree, and poplar.

Oak.

Of the oak, there are two species common in this island; that which Linnæus has named *Quercus Robur* is the most valuable for joiners' work; it is of a finer grain, less tough, and not so subject to twist as the other kind. Oak is also imported from the Baltic ports, from Germany, and from America. These foreign kinds being free from knots, of a straighter grain, and less difficult to work, they are used in preference to our home species. Foreign oak is also much used for cabinet-work; and lately, the fine curled oak that is got from excrescences produced by pollard, and other old trees, has been used with success in furniture. When well managed, it is very beautiful, and makes a pleasing variety. It is relieved by inlaid borders of black or white wood, but these should be sparingly used. Borders of inlaid brass, with small black lines, give a rich effect to the darker coloured kinds.

Fir.

The greater part of joiners' work is executed in yellow fir, imported from the north of Europe. White fir is often used for internal work, and American pine is much used for mouldings.

The forest of Braemar, in Aberdeenshire, furnishes yellow fir of an excellent quality, little inferior to the best foreign kinds.

Larch.

For the general purpose of joinery, the wood of the larch tree seems to be the best; this useful tree thrives well on our native hills. We have seen some fine specimens of this wood from Blair-Athol. It makes excellent steps for stairs, floors, framing, and most other articles.

Mahogany.

Mahogany, in joinery, is only used where painted work is improper, as for the hand-rails of stairs, or for the doors and windows of principal rooms. For doors it is not now so often used as it was formerly; its colour is found to be too gloomy to be employed in large masses. In cabinet-work it is almost the only kind used for ornamental work.

Lime-tree. Poplar.

Lime-tree, and the different species of poplar, make very good floors for inferior rooms, and may often be used for other purposes, in places where the carriage of foreign timber would render it more expensive. Lime-tree is valuable for carved work, and does not worm-eat; but carving is at present seldom used in joinery.

For farther information on wood, in addition to the works referred to, the reader may consult Evelyn's *Silva*, Dr Hunter's edition; Duhamel, *Du Transport, de la Conservation, et de la Force des Bois*, Paris, 1767; Barlow's *Essay on the Strength and Stress of Timber*, 1817; Tredgold's *Elementary Principles of Carpentry*, sect. x. 1820; and the article Dry-Rot.[2]

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomists *articulations*. See Anatomy.

JOINTURE, in *Scotch Law*, signifies generally a settlement of lands and tenements, made on a woman in consideration of marriage.

JOINVILLE, a city of the department of the Upper Marne, in France, in the arrondissement of Vassy. It stands on the left bank of the Marne, at the foot of a lofty hill, on which there remains an ancient castle, where the association of the League was formed in 1584. It contains 845 houses, and 3100 inhabitants. There are manufactures of woollen cloths and stockings. Long. 5. 1. E. Lat. 48. 26. N.

JOISTS, or Joysts, in *Architecture*, those pieces of timber framed into the girders and summers, upon which the boards of the floor are laid.

JOKAGUR, a town of Hindustan, in the Mahratta territories, in the province of Khandesh, seventy-four miles south-east from Oojain. Long. 76. 46. E. Lat. 22. 31. N.

JOKES. See Jesting.

JOLLOXOCHITL, an Indian word, signifying "flower of the heart," is the name of a plant, bearing a large, beautiful flower, which grows in Mexico, where it is much esteemed for its beauty and odour; the latter being so powerful, that a single flower is sufficient to fill a house with the most pleasing fragrance.

Jonah || Jonathan.

JONAH, or the *Prophecy of Jonah*, a canonical book of the Old Testament, in which it is related, that Jonah, about 771 before Christ, was ordered to go and prophecy the destruction of Nineveh, on account of the wickedness of its inhabitants. But the prophet, instead of obeying the divine command, embarked for Tarshish, when, a tempest arising, the mariners threw him into the sea. He was swallowed by a great fish, and after being three days and nights in its belly, was cast upon the land. The prophet, sensible of his past danger and surprising deliverance, now betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open the sins of the Ninevites, and proclaimed their sudden overthrow; upon which the whole city, by prayer, fasting, and speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Upon this, Jonah, fearing that he would pass for a false prophet, retired to a hill at some distance from the city, where God, by a miracle, condescended to show him the unreasonableness of his discontent.

JONATHAN, the son of Saul, celebrated in sacred history for his valour, and his friendship for David against

---

[1] *Traité Théoretique et Pratique de l'Art de Bâtir*, article Menuiserie, tome iv. p. 425, 1814.

[2] When the roof of Westminster Hall was under repair, an opportunity was taken to examine the wood of which it is constructed; and it was found to be of oak, and not of chestnut, as stated in the Article Dry-Rot, vol. viii. p. 233. The oak has been of an excellent kind, but is now much worm-eaten.

Jonathan ‖ Jones, Inigo.

the interest of his own house. He was slain in battle in the year 1055 before Christ.

JONATHAN, or *Jonas, Maccabæus*, brother of Judas, a renowned general of the Jews. He forced Bacchides, the Syrian general, who made war with the Jews, to accept a peace, conquered Demetrius Soter, and afterwards defeated Apollonius, general of that prince; but, being ensnared by Tryphon, he was put to death, 144 before Christ.

JONES, Inigo, a celebrated English architect, the son of a cloth-worker of London, was born in 1572. He was at first put as apprentice to a joiner; but having early distinguished himself by his inclination for drawing or designing, he was particularly noticed for his skill in landscape-painting. This afterwards recommended him to the favour of William earl of Pembroke, who sent him abroad with a handsome allowance, in order to perfect himself in that branch. He had no sooner arrived at Rome, than he found himself in his proper sphere; he felt that nature had not formed him to decorate cabinets, but to design palaces. He accordingly dropped the pencil, and conceived Whitehall. In the state of Venice he saw the works of Palladio, and learned that refined taste may be exerted on a less theatre than the capital of an empire. How he distinguished himself in a place where he had no opportunity to display his talents, we are not informed, though it would not be the least curious part of his history. Certain it is, however, that, on the strength of his reputation at Venice, Christian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country we have yet to learn. James I. found him at Copenhagen, and Queen Anne took him, in the capacity of her architect, to Scotland. He served Prince Henry in the same capacity, and the place of surveyor-general of the works was granted to him in reversion. On the death of that prince, Jones travelled once more into Italy, and, assisted by maturity of judgment, perfected his taste. To the interval between these voyages Mr Walpole is inclined to attribute those buildings of Jones which are less pure, and border too much upon the bastard style. Inigo's designs of that period are not Gothic, but have a littleness of parts, and a weight of ornament, with which the revival of the Grecian taste was encumbered, and which he shook off in his grander designs. The surveyor's place having become vacant, he returned to England; and, as if architecture was not all he had learned at Rome, he disinterestedly gave up the profits of his office, which he found extremely in debt, and prevailed upon the comptroller and paymaster to imitate his example, until the whole arrears were cleared off.

In 1620 he was employed in a manner very unworthy of his genius, King James having set him upon discovering, or rather guessing, who were the founders of Stonehenge. But his ideas were all Roman; consequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that mass of barbarous clumsiness, made him conclude that it was a Roman temple.

In the same year Jones was appointed one of the commissioners for the repair of St Paul's; but this was not commenced till the year 1633, when Laud, then bishop of London, laid the first stone, and Inigo the fourth. In the restoration of that cathedral he made two capital faults. He first renewed the sides with very bad Gothic; and then added a Roman portico, magnificent indeed, but which had no affinity to the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the same error at Winchester, thrusting a screen in the Roman or Grecian taste into the middle of that cathedral. Jones indeed was by no means successful when he attempted Gothic. The chapel of Lincoln's-Inn has none of the characteristics of that architecture. The cloister beneath seems oppressed by the weight of the building above.

The authors of the life of Jones place the erection of the Banqueting House in the reign of King Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finished in two years, being a small part of the pile designed for the palace of our kings, but so complete in itself, that it stands as a model of its kind. Several plates of the intended palace at Whitehall have been given, but, Mr Walpole thinks, from no finished design. The four great sheets are evidently made up from general hints; nor could such a source of invention and taste as the mind of Inigo ever produce so much sameness. The whole fabric, however, was so great an idea, that, according to Walpole, one forgets for a moment, in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy scene that passed before the windows of that very Banqueting House.

In 1623 he was employed at Somerset House, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is still in existence. The front to the river, part only of what was designed, and the water-gate, were afterwards erected on the designs of Inigo, as was the gate at York Stairs.

On the accession of Charles, Jones was continued in his posts under both king and queen. His fee as surveyor was eight shillings and fourpence a day, with an allowance of L.46 a year for house-rent, besides a clerk, and incidental expenses. What other remuneration he received, or whether he received any at all, we have not been informed.

During the prosperous state of the king's affairs, the pleasures of the court were indulged in with much taste and magnificence. Poetry, painting, music, and architecture, were all called in to contribute rational amusements. Mr Walpole is of opinion, indeed, that the celebrated festivals of Louis XIV. were copied from the shows exhibited at Whitehall, in his time the most polite court in Europe. Ben Jonson was the laureate; Inigo Jones the inventor of the decorations; Laniere and Ferabosco composed the symphonies; whilst the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of those entertainments called "masques," which had been introduced by Anne of Denmark. Lord Burlington had a folio of the designs for these solemnities, by Inigo's own hand, consisting of habits, masks, scenes, and so forth. The harmony of these masks was a little interrupted by a war which broke out between the composers, Inigo and Ben, in which, whoever was the aggressor, the turbulent temper of Jonson took care to put him most in the wrong.

The works of Inigo Jones are not scarce; and Surgeons' Hall is one of his best performances. One of the most admired is the arcade of Covent-garden, and the church; "two structures," says Mr Walpole, "of which I want taste to see the beauties. In the arcade there is nothing remarkable; the pilasters are as arrant and homely stripes as any plasterer could make. The barn-roof over the portico of the church strikes my eyes with as little idea of dignity and beauty as it could do if it covered nothing but a barn. It must be owned, that the defect is not in the architect, but in the order. Who ever saw a beautiful Tuscan building? Would the Romans have chosen that order for a temple?" The expense of building the church amounted to L.4500.

Ambresbury in Wiltshire was designed by Jones, but executed by his scholar Webb. Jones was one of the first who observed the same diminution in pilasters as in pillars. Lindsay House in Lincoln's-Inn Fields, which he built, owes its chief grace to this singularity. In 1618, a special commission was issued to the Lord Chancellor, the Earls of Worcester, Pembroke, Arundel, and others, to plant and reduce to uniformity Lincoln's-Inn Fields, as it should be drawn by way of map or ground-plot, by Inigo Jones, surveyor-general of the works. That square is laid out with a regard to so trifling a singularity, as to be of the exact dimensions of one of the Pyramids; a conceit which would have been admired in those ages when the keep at Kenilworth Castle was erected in the form of an horse-fetter, and the Escurial in the shape of St Laurence's gridiron.

Coleshill in Berkshire, the seat of Sir Matthew Pleydell, built in 1650, and Cobham Hall in Kent, were works of Jones. He was employed to rebuild Castle Ashby, and finished one front; but the civil war interrupted his progress there and at Stoke Park in Northamptonshire. Shaftesbury House, now the London Lying-in Hospital, on the east side of Aldersgate Street, is a beautiful front of his. The Grange, the seat of Lord Henley, in Hampshire, is entirely of this master. It is by no means a large house, but one of the best proofs of his taste. The hall, which opens to a small vestibule with a cupola, and the staircase adjoining, are beautiful models of the purest and most classic antiquity The gate of Beaufort Garden at Chelsea, designed by Jones, was purchased by Lord Burlington, and transported to Chiswick. He also drew a plan for a palace at Newmarket. One of the most beautiful of his works is the queen's house at Greenwich. The first idea of the hospital is said to have been taken from his papers by his scholar Webb. Heriot's Hospital in Edinburgh, and the improvements made in his time on Glammis Castle, Forfarshire, Scotland, are specimens of the designs of Inigo Jones.

Inigo tasted early the misfortunes of his master. Being not only a favourite, but a Roman Catholic, he in 1646 paid L.545 for his delinquency and sequestration. Whether it was before or after this fine, it is uncertain, that he and Stone the mason buried their joint stock in Scotland yard; but an order being published to encourage the informers of such concealments, and four persons being privy to the spot where the money was hidden, it was taken up, and reburied in Lambeth marsh. Grief, misfortunes, and age, put a period to his life, at Somerset House, on the 21st of July 1651. Several of his designs have been published by Mr Kent, Mr Colin Campbell, and Mr Isaac Ware. He left in manuscript some curious notes on Palladio's architecture, which are inserted in an edition of Palladio published in 1714.

Jones, *Sir William*, the son of William Jones, Esq. an eminent mathematician, contemporary with the great Newton, was born in London on the 28th of September 1746, and received the rudiments of his education at Harrow School, under the tuition of Dr Robert Sumner, whom he has celebrated in an elegant and affecting enlogium. From Harrow School he went to University College, Oxford, where the rapidity of his literary acquisitions excited universal admiration.

He travelled through France at the age of twenty-three, taking up his residence for some time at Nice, where society, and the various forms of government, became the favourite objects of his investigation. A wish to relieve his mother from the burden of his education made him long for a fellowship in his college; but having no immediate prospect of obtaining it, he, in 1765, became tutor to young Lord Althorp, afterwards Earl Spencer, in which situation he was introduced to the best of company, and had also leisure to prosecute the acquisition of knowledge, and the further cultivation of his intellectual powers, which were objects ever dear to him.

He obtained next year the fellowship he expected, and was thus raised to a state which he could not help viewing as independent. Being at Spa with his pupil in the year 1767, he employed much of his time in making himself acquainted with the German language; and in the following year he was requested, by the Duke of Grafton's under-secretary, to undertake a translation of a Persian manuscript of the life of Nadir Shah into the French language, of which the king of Denmark was anxious to have a version. This, his first publication, appeared in 1770, with the addition of a treatise on oriental poetry, which was very much admired on account of the elegance of the French style and the accuracy of the translation. For this excellent publication it appears that he received nothing more than a diploma from his Danish majesty, constituting him a member of the Royal Society of Copenhagen, with a warm recommendation to the notice of his own sovereign.

That he might be enabled to gratify his commendable ambition, he now began to think seriously of some profession; and, as he had conceived an early predilection for the law, he made that the object of his choice, and, in the month of September 1770, entered himself at the Temple. Yet the studies of his profession did not prevent him from making those literary advances in which he so much delighted; and oriental literature still continued a favourite object. When the life of Zoroaster by Anquetil Duperron made its appearance, in the preliminary discourse to which the university of Oxford had been attacked, our author defended it in a pamphlet written with equal severity and elegance. In 1772, he published a small volume of poems, being translations from the Asiatic poets, remarkable for the grace and brilliancy of their style; and in 1774 appeared his work *De Poesi Asiatica*, the beauty and purity of the Latin in which it is composed exciting the admiration of men of taste and learning both at home and abroad. He was called to the bar in the beginning of 1774, but declined to act in that capacity without a previous knowledge of the actual business of the profession. He was appointed a commissioner of bankrupts in 1776, about which period he addressed a letter to Lord Althorp, in which he expresses his ardent wish to have constitutional liberty established by constitutional means.

His translation of the speech of Isæus, on account of the elegant style and the profound critical and historical knowledge it displayed, commanded the admiration of every competent judge. Soon after this his practice at the bar increased with rapidity; but he had little reason to flatter himself with the prospect of advancement in professional rank and dignity, because he was known to be convinced of the injustice of the British cause respecting the American war, which he was at no pains to conceal; and an opponent of the measures of those who had then the direction of public affairs, had little preferment to look for. In 1780 he became a candidate to succeed to Sir Roger Newdigate as representative in parliament for the university of Oxford, in which he was respectably supported; but his political sentiments were ill suited to secure him a majority, a circumstance which made him decline the contest prior to the election. He soon afterwards published a pamphlet entitled "An Inquiry into the legal mode of suppressing Riots, with a Constitutional Plan of future Defence," recommending the propriety of making every citizen a soldier in cases of imminent danger. He next published a translation of seven ancient poems of the highest reputation in Arabia, which, with an ode on the marriage of Lord Althorp, procured for him the highest reputation. His essay on the law of bailment was also much admired, as was his speech at the London Tavern in defence of a parliamentary reform in 1782. At Paris he drew up a dialogue between a farmer and a country gentleman on the principles of government, which was published in Wales by the dean of St Asaph, and for which a bill of indictment was preferred against that clergyman. In a letter to Lord Kenyon, Mr Jones avowed himself the author, and asserted the principles it contained to be perfectly agreeable to the British constitution; but it appears that he afterwards relaxed considerably in his political ardour.

After the resignation of Lord North, and the appointment of Lord Shelburne, Mr Jones was nominated one of the judges in the British territories of India; an appointment which he had long wished for, as it would afford him an opportunity of prosecuting his favourite researches into oriental literature. He was appointed a judge in March 1783, and on the 20th of that month the honour of knighthood was conferred upon him. He arrived at Calcutta in September, and entered upon his office in December, opening the sessions with a very elegant charge to the grand jury. Here he planned the institution of a society similar to the Royal Society of London, the valuable labours and researches of which are already in the hands of the public. He collected materials for a complete digest of the Hindu and Mahommedan laws, which interesting work he did not live to bring to a conclusion. The publication of the *Asiatic Researches* occupied much of his attention. In 1789 he translated an ancient Indian drama called *Sacontala*, which has been considered as an interesting curiosity. In 1794 he gave the world his Ordinances of Menu, a famous Indian legislator, containing a system of duties both civil and religious.

The climate of India having proved unfavourable to the health of Lady Jones, she was obliged to return to England, whither Sir William designed soon to follow her. But, on the 20th of April 1794, he was seized at Calcutta with an inflammation of the liver, which set the powers of medicine at defiance, and on the 27th of the same month he expired without pain or struggle.

It may be fairly asserted that few men have died more respected or regretted, as few have passed a more useful and irreproachable life. The uncommon extent of his erudition has been displayed in all his writings, and hardly any subject of human research escaped his notice. He has scarcely ever been equalled as a linguist, for he is said to have been more or less acquainted with about twenty-eight different languages. Taste and elegance marked all his exertions, and he might have risen as a poet to the very first rank. Great as his knowledge was, his virtue and religion were not inferior. In whatever light we think proper to view him as standing in relation to society, he was undoubtedly a pattern worthy of imitation.

As a permanent monument to his memory, his affectionate lady published his whole finished works in six quarto volumes, in the year 1799; and a marble monument to his memory by the same endeared friend was placed in the anti-chamber of University College, Oxford. The East India Company also voted a monument to his memory in St Paul's Cathedral, and a statue of him to be sent out to Bengal. Memoirs of his life were published by Lord Teignmouth; and a society of gentlemen in Bengal, who had been educated at Oxford, subscribed a sum for a prize dissertation on his character and merits, by students of that university.

JONK, Jonque, or Junk, in naval affairs, is a kind of small ship, very common in the East Indies. These vessels are of various dimensions; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors of wood.

JONKOPING, a province in the south of Sweden, extending over 4804 square miles, and situated between 56. 56. and 58. 9. of north latitude, and 13. 9. and 15. 36. of east longitude. It is a mountainous and rocky district; but in the cultivated parts produces corn sufficient for food, and tolerable crops of potatoes, hemp, flax, and buck-wheat. The mines produce a little gold and silver, and considerable portions of iron and copper. The woods are extensive, and furnish deals, pitch, tar, and potash for exportation. It is divided into six bailiwicks or circles, comprehending three towns or cities, 4029 farming or mining establishments, and 121,250 inhabitants, who are remarkable for their sprightly cheerfulness, and especially for their activity. Jonkoping, the capital of the province, is a city on the Lake of Wetter, and close to two smaller lakes. It is well and regularly built, the court of justice and guildhall being of stone. It contains three churches, 608 houses, and 3145 inhabitants. A detachment of artillery is fixed here, with its laboratory and stores.

JONSAC, an arrondissement of the department of the Vendee, in France, extending over 622 square miles. It is divided into seven cantons, and these into 120 communes, and contains 78,528 inhabitants. The capital, a city of the same name, stands on the river Seugne, and has 610 houses, with 2590 inhabitants, whose chief trade is in wine and brandy.

JOORIA, a populous and thriving sea-port of Hindustan, in the Gujerat peninsula, belonging to the rajah of Amram. It is situated on the Gulf of Cutch, twenty miles below Wowamia, and carries on a considerable traffic with Mandavee and other places in the Gulf of Cutch, and on the western coasts of India, Persia, and Arabia, and occasionally with Bombay. Its exports consist chiefly of cotton, ghee, oil, and hides, to the southward, and coarse cloth for Persia and Arabia. In return it receives spices of all sorts, powder, lead, and cocoa-nuts. In 1808, the rajah and principal inhabitants agreed with the Bombay government not to permit or connive at piracy; and also to abstain from plundering persons in distress. Long. 70. 40. E. Lat. 22. 40. N.

JOR, the Hebrew for a river, which, joined with Dan, concurs to form the term *Jordan*.

JORDAN, a celebrated river of Palestine, which has its rise in a mountain called Jebel Sheik, and passing by Cæsarea Philippi, now called Panias, is increased by other tributary streams from the adjacent mountains, when it becomes a considerable river. It rolls on for ten miles through rocky and wooded banks, when it enters the great Lake of Tiberias on the north side, and again issues from its southern extremity. It then meanders in a southern direction through an extensive plain, and passing to the east of Jericho, falls into the Dead Sea, or Lake Asphaltites. The lower part of its course is through the middle of a barren valley, with hills of white clayey soil on each side, about 200 feet in height. Its banks, when it was crossed by Mr Buckingham, and when it was at its lowest ebb, were fourteen or fifteen feet high. On each side the stream is lined by close thickets, which would afford ample shelter to wild beasts; and which, being driven away by the swelling of the river, has given rise to the Scripture expression, like "a lion from the swelling of Jordan." Near Jericho the Jordan is deep and very rapid, nearly equal in breadth to the Thames at Windsor. It overflows its banks both in the spring and during the time of harvest, from the early and the later rains.

JORDANO, Lucca, an eminent Italian painter, was born at Naples in the year 1632. He became early a disciple of Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da Cortona, whom he assisted in his great works. Some of his pictures being seen by Charles II. king of Spain, he engaged him to paint the Escurial, in which task he acquitted himself as a great painter. The king having shown him a picture of Bassani, expressing his concern that he had not a companion, Lucca painted one so exactly in Bassani's manner, that it was considered as a performance of that master; and for this service he was knighted, and gratified with several honourable and valuable employments. The works he had executed in

Spain raised his reputation so high when he returned to Naples, that, though he was a very quick workman, he could not supply the eager demands of the citizens. No one, not even Tintoret, ever painted so much as Jordano; and his generosity carried him so far as to present altar-pieces to churches that were not able to purchase them. His labours were rewarded with great riches, which he left to his family at his death, which took place in 1705.

JORJAN, a town of Persia, in the province of Astrabad, situated to the east of the Caspian. It is considered as one of the strongest fortresses in the kingdom, and is frequently mentioned in Persian history. It is 100 miles west of Meshid, and 300 north-north-east of Ispahan.

JOSEPH, the son of Jacob, memorable for his chastity, and the honours conferred on him at the court of Egypt. He died in the year 1635 before Christ, aged a hundred and ten.

JOSEPHUS, the celebrated historian of the Jews, was of noble birth, being by his father Mattathias descended from the high priests, and by his mother of the blood-royal of the Maccabees. He was born A. D. 37, under Caligula, and lived under Domitian. At sixteen years of age he betook himself to the sect of the Essenes, and then to the Pharisees; and having been successful in a journey to Rome, upon his return to Judæa he was made captain-general of the Galileans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus to the siege of Jerusalem, and wrote his Wars of the Jews, which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish Antiquities, which he finished under Domitian; 2. Two books against Apion; 3. A Discourse on the Martyrdom of the Maccabees; and, 4. His own Life. These works are all written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wilderness, and died in 1424 before Christ, aged a hundred and ten years.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts; the first of which is a history of the conquest of the land of Canaan; the second, which begins at the twelfth chapter, is a description of that country, and the division of it amongst the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant which he caused to be made by the Israelites, together with the death of their victorious leader and governor. The whole comprehends a term of seventeen, or, according to others, of twenty-seven years.

JOSIAH, king of Judah, the destroyer of idolatry, and the restorer of the true worship, an excellent magistrate and a valiant general, was slain in battle, 609 before Christ.

JOSSELIN, a town of the arrondissement of Ploermel, in the department of Finisterre, in France. It stands on the river Oust, contains 2692 inhabitants, and has some manufactures of coarse woollen cloths. It is visited in summer on account of celebrated mineral springs. Near to it is a curious cavern called the Pertuis des Fées, or Fairy's Cave, with an arch twenty-five feet in height.

JOTAPATA, in *Ancient Geography*, a town of the Lower Galilee, distant forty stadia from Gabara; a strong place, situated on a rock, walled round, and encompassed on all hands with mountains, so as not to be seen except by those who approach very near. It was taken with difficulty by Vespasian. When it surrendered, it was ordered to be razed.

JOUDPOOR, an extensive rajpoot principality of Hindustan, in the province of Ajmeer, of which the proper and ancient name was Marwar, and its sovereign was called the Rhatore rajah. The boundaries of this territory are not very exactly defined, being intermixed with that of Odeypoor and Jyepoor. They are said, however, to reach nearly to the Indus on the west, the town of Amerkote in Sinde, within thirty miles of that river, being in possession of the rajah; on the east his territories comprehend the city of Meerta or Meerat: on the north they are bounded by Bicanere and Jesselmere; on the south by the province of Gujerat and Odeypoor; and on the east by the dominions of Jyenagur. The southern and eastern parts of Joudpoor are fertile, being watered by streams that flow from the mountains. They are chiefly cultivated by Jauts, and they produce wheat, barley, and other kinds of grain common in India; also cotton, sugar, &c. The western portion of the country consists principally of desert or pasture lands, on which is bred a hardy race of horses, camels, and cattle. There are also lead mines in the country. The imports consist of cloth, shawls, spices, opium, rice, sugar, steel, and iron. The exports are salt, camels, bullocks, and horses. The principal inhabitants of Joudpoor are Rhatore rajpoots, who are a brave, handsome race of men, of the purest castes. The rajahs of Odeypoor, Jyepoor, and Joudpoor formerly enjoyed considerable power and consequence, and their alliance was much sought after by the Mogul emperors of Hindustan. The country is described as having been much more populous in ancient times.

The rajahs of Jyepoor and Joudpoor were employed with their followers in the imperial armies, and attained the highest military rank till the time of Aurungzebe, who attempted to enforce the capitation tax on his Hindu subjects, and sought to obtain possession of the children of the rajah Jerwont Sing, who died in the year 1678; a circumstance that gave rise to a war, in which the rajpoots were ultimately victorious, and, after the death of Aurungzebe, they only paid a nominal allegiance. Being afterwards weakened by dissensions amongst themselves, they became tributary to the Mahrattas, and were only delivered from their yoke by the British in their successful war against the Pindaries.

JOUDPOOR, a fortified city, and capital of the above principality, is well built, mostly of stone. It is situated on a hill; and carries on a considerable traffic, by means of caravans, with Gujerat and the Deccan. The rajah is now one of the British allies. Long. 73. 18. E. Lat. 26. 27. N.

JOURNAL, a day-book, register, or account of what passes daily. See DIARY.

JOURNAL, in merchants' accounts, is a book in which every particular article is posted out of the waste-book, and made debtor. This is to be very clearly worded, and fairly engrossed. See BOOK-KEEPING.

JOURNAL, in *Navigation*, a sort of diary or daily register of the ship's course, winds, and weather, together with a general account of whatever is material to be remarked in the period of a sea-voyage. In all such journals, the day, or what is called the twenty-four hours, terminate at noon, because the errors of the dead reckoning are at that period generally corrected by a solar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; and the suitable shifting, reducing, or enlarging the quantity of sail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew; together with the discovery of other ships or fleets, land, shoals, breakers, soundings, and the like.

JOURNAL is also a common name of weekly essays, newspapers, and also of several books which come out at stated times, and give abstracts, accounts, or criticisms of the new books that are published, and the improvements daily made in arts and sciences.

JOURNEY, a tract of ground passed over in travelling by land, properly as much as may be passed in one day.

JOURNEYMAN, properly one who works by the day only; but the word is now used for any one who works under a master, either by the day, the year, or the piece.

JOVIAN, the Roman emperor, elected by the army after the death of Julian the Apostate, in 363. He at first refused to assume the purple, saying he would not command idolatrous soldiers; but, upon an assurance that they would embrace Christianity, he accepted the throne, and immediately shut all the pagan temples. But he did not long enjoy the dignity to which his merit had raised him, having been suffocated in his bed by the fumes of a fire which had been made to dry the chamber. This happened A. D. 364, in the thirty-third year of his age, and the eighth month of his reign. See CONSTANTINOPLE.

JOVIUS, PAUL, in Italian *Giovio*, a celebrated historian, was born at Como, in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldest brother Benedict Jovius, under whom he became well skilled in classical learning; and then went to Rome for the sake of enjoying the benefit of the Vatican library. He there wrote his first work, *De Piscibus Romanis*, which he dedicated to Cardinal Louis of Bourbon. For many years he received a pension of five hundred crowns from Francis I. king of France, whose favour he secured by his flatteries. But, in the following reign, having disgusted the Constable Montmorency, his name was struck out of the list of pensioners. Jovius, however, did not suffer his spirits to sink under his misfortune. He had obtained a high reputation in the learned world by his writings; and having always showed great respect to the house of Medicis, on whose praises he had expatiated in his works, he applied to Clement VII. and obtained the bishoprick of Nocera. His principal production is his History, which is that of his own time, beginning with 1494, and extending to the year 1544. The composition of this work constituted the chief business of his life. For he formed the plan of it in the year 1515, and continued to labour upon it till his death, which happened at Florence in 1552. It is printed in three volumes folio. Jovius is allowed to have been a man of wit as well as learning; he was master of a polished style, and has made many curious observations; but being a venal writer, his statements are not much credited.

JOY, in *Ethics*, is that passion which is produced by love, regarding its object as present, either immediately or in prospect, in reality or imagination. The operation of joy sometimes affects the functions of the body, by increasing the secretion of perspiration, and otherwise.

JUAN FERNANDEZ, an island in the South Pacific Ocean, about one hundred and ten leagues west of Chili, of which it may be considered an appendage, the governor of it being appointed by the president of that republic. It is about twelve miles in length, and hardly six in breadth; but, though small, it is so diversified by lofty hills, streams, and varied vegetation, that it has been described as one of the most enchanting spots upon the sea. It abounds with excellent timber trees, amongst which are the sandal, the yellow wood, and the chonta, a species of palm, which produces a pleasant fruit. It is noted for the refreshments it has afforded to navigators, from its wild goats, vegetables, and water. This island was discovered by Juan Fernandez, from whom it derived its name, and was early settled from the continent of South America. After the death of the discoverer it was deserted, but subsequently the Spaniards made a permanent establishment on it, and settled the port called Juan Fernandez on the south-west coast. There is another port lying to the south, which is called English Harbour, from the circumstance of its having given shelter to Anson's squadron during his celebrated voyage round the world. It was also early noted for having been the solitary residence for several years of Alexander Selkirk, a Scotch mariner, who was cast away upon it; an event upon which, as is well known, De Foe founded his celebrated narrative of Robinson Crusoe. Long. 78. 58. 15. W. Lat. 33. 40. 0. S.

JUAN *de Ulloa*, or the island of Sacrifices, is an island on the west coast of Mexico, in the bay of Vera Cruz. It was first visited by Grijalva, who gave it its name from having found on it a temple in which a human sacrifice had been offered up the day previous to his landing. It is now a mere heap of sand, but there are vestiges of ruins upon it; and when Humboldt was in this quarter of the world, one wretched Indian family constituted its only inhabitants.

JUAN *Blanco*, or *White Jack*, a Spanish name for platina.

JUBA, king of Numidia, who succeeded to the throne on the death of his brother Hiempsal, about B. C. 50. In the war between Cæsar and Pompey, we find Juba espousing the cause of the latter, and proceeding to the assistance of Varus, who was besieged in Utica by Curio. He gained a victory over Curio; and when many of the partisans of Cæsar had surrendered to Varus, on condition of their lives being preserved, Juba, disregarding the promise made to them, put the greater part to death. (Cæs. *De Bello Civili*, ii. 26, 42.) After the battle of Pharsalia, Cæsar proceeded into Africa to crush the remains of Pompey's party; but Juba, thinking this a favourable opportunity of destroying the troops of his opponent, collected a large army. He was soon, however, obliged to retire to the protection of his dominions, which were threatened by Sittius, the chief of a band of banditti. Appointing Sabura to the command of the troops against Sittius, he proceeded to rejoin Scipio at the head of a numerous army. The pride of Juba could not tolerate that Scipio should wear a purple cloak like his own, and Scipio did not think proper to offend his powerful ally on such a trivial point. A battle was fought, in which Cæsar defeated the allied army; and the Numidian prince fled to his own dominions, where he found Sabura had been defeated by Sittius. He wished to shut himself up in Zama; but the inhabitants gained by Cæsar having shut the gates of their city, Juba caused himself to be put to death (B. C. 46) by Petreius, one of his companions in misfortune (Liv. *Epit.* 114; Flor. iv. 2), or by a slave (Cæs. *Afr.* 94). Cæsar reduced the kingdom of Juba into the form of a province, and the historian Sallust was the first governor. (*Afr.* 97.)

JUBA II., the son of the former, was carried to Rome by Julius Cæsar on the defeat and death of his father, and formed one of the principal ornaments of the triumph which Cæsar enjoyed. At Rome the young prince received the benefit of an excellent education; and being naturally of an intelligent and thoughtful disposition, he soon equalled in learning and knowledge the wisest philosophers of Greece and Rome. (Plut. *Cæs.* 55.) Augustus became attached to him from his excellent qualities, and gave him in marriage Selene, or Cleopatra, the daughter of Antony and Cleopatra. (*Anton.* 87.) He was restored to the kingdom of his father by Augustus, and some parts of Gætulia were added to it. The Gætulians, unwilling to acknowledge themselves tributary to a prince imposed upon them by the Romans, made incursions into his territory, which he was unable to repel until he received assistance from Augustus. (Dion Cass. li. liii.) He was more fortunate in peace than in war, and made himself so much beloved by his subjects, that they placed him in the number of their gods, and erected statues to his honour. Pliny states, that the profound knowledge of Juba made him more illustrious than even his crown. He wrote many historical works of great value: the Antiquities of Assyria and of Rome; a History of Arabia, which he dedicated to the young Caius Cæsar; a History of Painting and of Painters; a History of Theatres, many fragments of which still remain; on the Nature and Qualities of different Animals; a Treatise on the Plant Euphorbia; and an Essay on the source of the Nile.

JUBILEE, amongst the Jews, denotes every fiftieth year, being that following the revolution of seven weeks of years, at which time all the slaves were made free, and all lands reverted to their ancient owners. But the jubilees were disregarded after the Babylonian captivity. The word, according to some authors, comes from the Hebrew, *jobel*, which signifies *fifty;* but this must be a mistake, for the Hebrew, *jobel*, does not signify fifty, neither do its letters, taken as ciphers, or according to their numerical powers, make up that number, these being 10, 6, 2, and 30, or in all 48. Others say, that *jobel* signifies a *ram*, and that the jubilee was so called, because proclaimed with a ram's horn, in memory of the ram which appeared to Abraham in the thicket. Masius chooses to derive the word from *Jubal*, the first inventor of musical instruments, which for that reason were called by his name; and hence the words *jobel* and *jubilee* came to signify the year of deliverance and remission, because proclaimed with the sound of one of those instruments, which at first was no other than the horn of a ram. Others derive *jobel* from יבך, *jabal*, in hiphil, הֹבִיל, *hobil*, which signifies to recall or return; because this year restored all slaves to their liberty, and recalled exiles to their native land. The institution of this festival is to be found in Leviticus (chap. xxv. v. 8–17).

The learned are divided about the year of jubilee; some maintaining that it occurred every forty-ninth, and others that it took place every fiftieth year. The ground of the former opinion is chiefly this, that the forty-ninth year being of course a sabbatical year, if the jubilee had been observed on the fiftieth, the land must have had two sabbaths, or have lain fallow two years, which, without a miracle, would have produced a scarcity. On the other hand, it is alleged, that the Scripture expressly declares for the fiftieth year (Levit. xxv. 10, 11): and, besides, if the jubilee and sabbatical year had been the same, there would have been no need for a prohibition against sowing or reaping, because this kind of labour was prohibited by the law of the sabbatical year (Levit. xxv. 4, 5). The authors of the Universal History (book i. chap. 7, note R) endeavour to reconcile these opinions, by observing, that as the jubilee began in the first month of the civil year, which was the seventh of the ecclesiastical, it might be said to be either the forty-ninth or fiftieth, according as one or other of these computations was followed. The political design of the law of the jubilee was to prevent the oppression of the poor, as well as to obviate their being liable to perpetual slavery. By this means a kind of equality was preserved amongst all the families of Israel, and the distinction of tribes was also preserved, that they might be able, when there was occasion, on the jubilee year, to prove their right to the inheritance of their ancestors. It served also, like the *olympiads* of the Greeks, and the *lustra* of the Romans, for the computation of time. The jubilee has likewise been supposed to be typical of the gospel state and dispensation, described by Isaiah (lxi. ver. 1, 2, in reference to this period) as the "acceptable year of the Lord."

Jubilee, in a more modern sense, denotes a grand solemnity or ceremony, celebrated at Rome, in which the pope grants a plenary indulgence, at least to as many as visit the churches of St Peter and St Paul.

The jubilee was first established by Boniface VII. in the year 1300, in favour of those who should proceed *ad limina apostolorum;* and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the *golden year;* a circumstance which induced Clement VI. in 1343, to reduce the period of the jubilee to fifty years. Urban VI. in 1389 appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475 brought it down to every twenty-five years, that all persons might have the benefit of it once in their lifetime. Boniface IX. granted the privilege of holding jubilees to several princes and monasteries; for instance, to the monks of Canterbury, who had a jubilee every fifty years, when people flocked from all parts to visit the tomb of St Thomas-a-Becket. Jubilees are now become more frequent, and the pope grants them as often as the church or himself has occasion for them. There is usually one at the inauguration of a new pope. To be entitled to the privileges of the jubilee, the bull enjoins fastings, alms, and prayers. It gives the priests full power to absolve in all cases, even those otherwise reserved to the pope, to make commutations of vows, and to perform other functions, in which it differs from a plenary indulgence. During the time of jubilee all other indulgences are suspended.

One of our kings, Edward III., caused his birth-day to be observed in the manner of a jubilee when he became fifty years of age, in 1362, but never before nor after; and this he did by releasing prisoners, pardoning all offences except treason, making good laws, and granting many privileges to the people.

There are particular jubilees in certain cities, when several of their feasts fall upon the same day; at Puy-en-Velay, for instance, when the feast of the Annunciation happens on Good Friday; and at Lyons, when the feast of St John Baptist concurs with the feast of Corpus Christi. The Jesuits celebrated a solemn jubilee at Rome in 1640, that being the centenary or hundredth year from their institution; and the same ceremony was observed in all their houses throughout the world.

JUDAH, the fourth son of Jacob, and father of the chief of the tribes of the Jews, distinguished by his name, and honoured by giving birth to the Messiah, died in the year before Christ 1636.

Judah Hakkadosh, or the Saint, a rabbi celebrated for his learning and riches, who lived in the time of the Emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us that Rabbi Judah, who was very rich, collected, about twenty-six years after the destruction of the temple, in a book which he called *Misnia*, the constitutions and traditions of the Jewish magistrates who had preceded him. But as this book was short and obscure, two Babylonian rabbin, Rabbina and Ase, collected all the interpretations, disputes, and additions, which had been made upon the *Misnia* until their time, and formed the book called the *Babylonian Talmud* or *Gemara*, which is preferable to the Jerusalem Talmud, composed some years before by Rabbi Jochonan of Jerusalem. The *Misnia* is the text of the Talmud, of which there is a good edition in Hebrew and Latin by Surenhusius, with notes, in three vols. folio. It were to be wished that as much had been done for the Gemara.

The Kingdom of Judah was of small extent compared with that of the kingdom of Israel, consisting only of two tribes, Benjamin and Judah. Its eastern boundary was the Jordan; on the west it had the Mediterranean in common with the Danites, if we except some places taken by the kings of Israel, which had been recovered by the Philistines and others; on the south its limits seem to have been contracted under Hadad, of the royal family of Edom (1 Kings, xi. 14).

Tribe of Judah, one of the twelve divisions of Palestine by tribes (Josh. xv.), having Idumea on the south, from the extremity of the Lake Asphaltites, and also the wilderness of Zin, Cadesbarnea, and the brook or river of Egypt;

on the east the Lake Asphaltites; on the west the Mediterranean; and on the north the mouth of the lake, where it receives the Jordan, Bethsemes, and Thimna, as far as Ekron on the sea.

JUDAISM, the religious doctrines and rites of the Jews. Judaism was but a temporary dispensation, and destined to give way, at least the ceremonial part of it, at the coming of the Messiah. For a complete system of Judaism, it is only necessary to refer to the books of Moses. Judaism was anciently divided into several sects, the principal of which were the Pharisees, Sadducees, and Essenians. At present there are but two sects amongst the Jews, viz. the Caraites, who admit of no rule of religion but the law written by Moses; and the Rabbinists, who add to the law the traditions of the Talmud.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for the many victories which he gained over his enemies, was at last slain in battle, 261 before Christ. See JEWS.

JUDE, ST, brother of St James the younger, and son of Joseph (Mat. xiii. 55). He preached in Mesopotamia, Arabia, Syria, Idumea, and died in Berytus for the profession of the faith of Christ. He wrote the epistle which goes under his name, and which was composed after the death of most of the apostles. He was cruelly put to death for reproving the superstition of the Magi.

JUDE, or *the General Epistle of Jude*, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, and conducting themselves by worldly wisdom, and not by the spirit of God.

JUDEA, or JUDÆA, in *Ancient Geography*, taken largely, denotes either all Palestine, or the greater part of it, and thus it is generally employed in the Roman history; Ptolemy, Rutilinus, Jerome, Origen, and Eusebius, using the word to signify the whole of Palestine. Here we consider it as denoting the third part of the country on this side of the Jordan, the southern part being distinct from Samaria and Galilee; and under such restriction it is often employed, not only in Josephus, but also in the New Testament. It contained four tribes, Judah, Benjamin, Dan, and Simeon, together with Philistia and Idumea; and hence it was included between Samaria on the north, Arabia Petræa on the south, the Mediterranean on the west, and the Lake Asphaltites, with part of Jordan, on the east. Josephus divides it into eleven toparchies, and Pliny into ten; so that, according to both, it had a greater extent than that which is just mentioned. See PALESTINE.

JUDENBURG, a circle of the Austrian province of Steyermark, extending over 2312 square miles, and containing five cities with their suburbs, fourteen market-towns, and 387 villages, with 16,624 houses, and 87,388 inhabitants. The chief place, which gives its name to the circle, is situated on the river Mur, in the most fertile part of the province. It contains three churches, and 1684 inhabitants, living in 260 houses. Long. 14. 35. 25. E. Lat. 47. 23. 29. N.

JUDEX, MATTHEW, one of the principal writers of the Centuries of Madgeburg, was born at Tipplcswolde in Misnia in 1528. He taught theology with great reputation; but, owing to party feuds, met with many annoyances in the exercise of his ministry. He wrote several works, and died in 1564.

JUDGE, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pronounce sentence.

JUDGES, in Jewish antiquity, certain supreme magistrates who governed the Israelites from the time of Joshua till the reign of Saul. These judges resembled the Athenian archons and the Roman dictators. The dignity of judge was for life, but not always in uninterrupted succession. God himself, by an express declaration of his will, regularly appointed the judges. The Israelites, however, did not always wait for his appointment, but sometimes chose for themselves a judge in times of danger. The power of the judges extended to affairs of peace and war. They were protectors of the law, defenders of religion, and avengers of all crimes; but they could make no laws, nor impose any new burdens upon the people. They lived without pomp or retinue, unless their own fortunes enabled them to do so; for the revenues of their office consisted in voluntary presents from the people. They continued from the death of Joshua till the beginning of the reign of Saul, being a space of about 339 years.

JUDGES, in ordinary affairs, civil and religious, were appointed by Moses in every city, to terminate differences; but in affairs of greater consequence, the differences were referred to the priests of Aaron's family, and the judge of the people or prince at that time established. Moses likewise established two courts in all the cities; one consisting of priests and Levites, to determine points concerning the law and religion; the other consisting of heads of families, to decide in civil matters.

Book of JUDGES, a canonical book of the Old Testament, so called from its relating to the state of the Israelites under the administration of those illustrious persons who were called *judges*, from being both the civil and military governors of the people, and who were raised up by God upon special occasions after the death of Joshua till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprung up after the death of Joshua; and it gives us a short view of the dispensations of heaven towards this people, sometimes relieving and delivering them, and at others severely chastising them by the hands of their enemies.

Select JUDGES (*Judices selecti*), in *Antiquity*, were persons summoned by the prætor to give their verdict in criminal matters in the Roman courts, as juries do in ours. No person could be regularly admitted into this number till he was twenty-five years of age. The *Sortitio Judicum*, or impannelling of the jury, was the office of the *Judex Questionis*, and was performed after both parties had come into court, each having a right to reject or challenge whomsoever he pleased. The number of the *Judices selecti* varied, according to the nature of the charge. When the proper number appeared, they were sworn, took their places in the *subsellia*, and heard the trial.

JUDGMENT, amongst logicians, is a faculty or rather an act of the human soul, by which it compares its ideas, and perceives their agreement or disagreement. See METAPHYSICS and LOGIC.

JUDGMENT, in *Law*, is the sentence pronounced by the court upon the matter contained in the record. In the law of England, judgments are of four sorts; first, where the facts are confessed by the parties, and the law determined by the court, as in the case of judgment upon demurrer; secondly, where the law is admitted by the parties, and the facts disputed, as in the case of judgment upon verdict; thirdly, where both the fact and the law arising thereon are admitted by the defendant, which is the case of judgments by confession or default; or, lastly, where the plaintiff is convinced that either fact or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution, which is the case in judgments upon a *nonsuit* or *retraxit*.

JUDGMENT, in criminal cases, is the next stage of prosecution, after trial and conviction, in such crimes and misdemeanours as are either too high or too low to be included within the benefit of clergy. For when, upon a capital charge, the jury have brought in their verdict guilty in the presence of the prisoner, he is either immediately, or at a convenient time soon afterwards, asked by the court, if he has any thing to offer why judgment should not be awarded against him? And in case the defendant be found guilty of a misdemeanour (the trial of which may, and does usually, happen in his absence, after he has once appeared), a *capias* is awarded and issued, to bring him up to receive his judgment; and if he absconds, he may be prosecuted even to outlawry. But whenever he appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in arrest or stay of judgment; as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings are set aside; but the party may be indicted again.

A pardon also may be pleaded in arrest of judgment; and it has the same advantage when pleaded here as when pleaded upon arraignment, namely, saving the attainder, and, of course, the corruption of blood; which nothing can restore but parliament, when a pardon is not pleaded till after sentence. Praying the benefit of clergy may also be ranked amongst the motions in arrest of judgment.

If all these resources fail, the court must proceed to pronounce that judgment which the law has annexed to the crime. Of these some are capital, which extend to the life of the offender, and consist generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or disgrace, are superadded. Some punishments consist in exile or banishment, by abjuration of the realm, or transportation beyond the seas; others, in loss of liberty, by perpetual or temporary imprisonment. Some extend to confiscation, by forfeiture of lands or moveables, or both, or of the profits of lands for life; others induce a disability of holding offices or employments, of being heirs, executors, and the like. Some, though rarely, occasion a mutilation or dismembering, by cutting off the hand or ears; others fix a lasting stigma on the offender, by slitting the nostrils or branding in the hand or face. Some are merely pecuniary, by stated or discretionary fines; and there are others which consist principally in the ignominy, though most of them are mixed with some degree of corporal pain.

JUDICATURE, the quality or profession of those who administer justice.

JUDICATURE is also used to signify the extent of the jurisdiction of the judge, and the court in which he sits to render justice.

JUDICIA CENTUMVIRALIA, in Roman antiquity, were trials before the *Centumviri*, to whom the prætor committed the decision of certain matters of inferior nature, like our justices of the peace at the quarter-sessions. During the *judicia centumviralia*, a spear was stuck up in the forum, to signify that the court was sitting.

JUDICIUM CALUMNIÆ was an action brought against the plaintiff for false accusation. The punishment, upon conviction, was *inustio frontis*, or branding in the forehead.

JUDICIUM Dei, Judgment of God, was a term anciently applied to all extraordinary trials of secret crimes, as those by arms and single combat, and the ordeals, or those by fire or red-hot ploughshares, by plunging the arm in boiling water, or the whole body in cold water, in hopes that God would work a miracle rather than suffer truth and innocence to perish. These customs were a long time kept up even amongst Christians; and they are still in use amongst some nations. Trials of this sort were usually held in churches in presence of the bishops, priests, and secular judges, after three days' fasting, confession, and communion, with many adjurations and ceremonies, which are described at large by Du Cange.

JUDICIUM Parium denotes a trial by a man's equals, that is, of peers by peers, and of commoners by commons. In Magna Charta it is more than once insisted on as the principal bulwark of our liberties, that no freeman shall be hurt either in his person or in property, *nisi per legale judicium parium suorum vel per legem terræ*. And this was esteemed in all countries a privilege of the highest and most beneficial nature.

JUDICIUM Falsi was an action which lay against the judges for corruption or unjust proceedings.

JUDICIUM Prævaricationis was an action brought against the prosecutor, after the criminal was acquitted, for suppressing the evidence of, or extenuating, his guilt, rather than urging it home, and bringing it to light.

JUGERUM, in Roman antiquity, a square of 120 Roman feet, being to the English acre as 10·000 to 16·097.

JUGGERNATH, properly JAGATNATHA, the Lord of the World, a celebrated temple and place of Hindu worship, on the sea-coast of Orissa, and district of Cuttack, near to the town of Pursolem, esteemed the most sacred of all the Hindu religious establishments. It is situated a few miles to the north-east of the Chilka Lake, close to the sea-shore, and, when seen from a distance, is a shapeless mass of building, but forms an excellent landmark for navigators in approaching so low a coast. It is surrounded by several courts or inclosures, into the interior of which no European is admitted; and at the gate of the outward wall are two large statues of singhs, an imaginary or fabulous animal, nearly as large as an elephant. Juggernath is said to be one of the incarnations of Vishnu; but the original dedication of the temple is involved in fable. It is known to have existed for above 800 years, and is mentioned as a celebrated place of Hindu worship by the oldest Mahommedan historians of India. The idol itself is a huge disgusting image of the human form, made of wood, with a frightful black visage, and a distended mouth foaming with blood. On each side of him is another image, one part of which is painted white, and the other yellow; the first is said to be the image of his sister Shubudra, the other that of his brother Balaram. The throne of the idol is placed on a stupendous car or moveable tower, about sixty feet high, resting on wheels, which, from the weight, indent the ground deeply as they move along; and it is then that, in the fanatical madness of his bloody superstition, devotees throw themselves under the wheels and are crushed to death. The tower is drawn along by the people by means of ropes, amidst the shouts of the ignorant multitude; and upon the car are the priests and attendants. The concourse of Hindu pilgrims to this shrine is immense; the aged come to die at Juggernath; and so numerous are these pilgrims, that the approach to it is known at the distance of fifty miles by the quantity of human bones strewed on the way. The impurity of the Hindu idolatry is strongly indicated by the indecent sculptures that cover the walls of the temple and the sides of the machine.

The resort of Hindu pilgrims to Juggernath is the source of a considerable revenue; and the British, by the conquest of the province of Cuttack from the Mahrattas in 1803, have succeeded to all their rights as sovereigns, and consequently to the right of collecting this tax on the superstition of the inhabitants. The superintendence of the temple and of its interior economy was conferred on the rajah of Khoordah. The sum realized by the company from this singular source of revenue is very trifling, not exceeding 11,000 or 12,000 rupees. The tax amounts to from ten to two rupees, according to the different classes of pilgrims, who are allowed access to the temple from thirty to four days. The devotees of low caste are, however, obliged to perform all their ceremonies on the outside of the temple. A great number of pilgrims, including all devotees and religious persons, are admitted gratuitously to the temple. Merchants and traders have access to the town of Parsottom, which is adjacent to the idol; but they have no access to the temple except by permission. One of the chief periods of pilgrimage is in March, when the Dole Jattrah takes place; and the other in July, when the Ruth Jattrah is celebrated. The travelling distance from Calcutta it 311 miles, from Benares 512, from Madras 719, from Delhi 910, and from Bombay 1052 miles. Long. 86. 5. E. Lat. 19. 49. N.

JUGGLERS, a kind of people whose profession, namely, to perform slight-of-hand tricks, has not often been deemed either respectable or useful. Yet Professor Beckmann, in the third volume of his *History of Inventions*, defends them, and pleads ably the cause of the practitioners of legerdemain, including rope-dancers, and such as exhibit feats of uncommon strength. He places all these under the general denomination of jugglers; and taking it for granted that every useful employment is full, he contends, strangely enough, that there would not be room on the earth for all its present inhabitants, did not some of them practise the art of juggling.

These arts, he observes, are not unprofitable, for they afford a comfortable subsistence to those who practise them, which they usually spend upon the spot; and this he considers as a good reason why their sojourning in a place ought to be encouraged. He is also of opinion, that if the arts of juggling served no other end than to amuse the most ignorant of our citizens, it is proper that they should be encouraged, for the sake of those who cannot enjoy the more expensive deceptions of an opera. They convey instruction in the most acceptable manner, and serve as an antidote to superstition. We scarcely think, however, that it is innocent to entice the labouring poor, by useless deceptions, to part with their hard-earned pittance to idle vagabonds, whose life cannot be comfortable, being passed amidst scenes of the most grovelling dissipation.

Juggling is certainly of very great antiquity. The deception of breathing out flames was practised by some of the slaves in Sicily about 150 years before the commencement of the Christian era. It is, however, practised in modern times with much greater dexterity. The ancients made use of naphtha, a liquid mineral oil, which kindles when it only approaches a flame. According to Plutarch, Alexander the Great was astonished and delighted with the secret effects of naphtha, which were exhibited to him at Ecbatana. Wonder has been excited in modern times by persons walking over burning coals or red-hot iron; but this is easily done by rendering the skin of the feet callous and insensible, so that the nerves under it are secured from injury. We are told by Beckmann that the Hirpi, who dwelt near Rome, jumped through burning coals; that women were accustomed to walk over burning coals at Castabala, near the temple dedicated to Diana; that the exhibition of cups and balls is often mentioned in the works of the ancients; and that the various feats of horsemanship exhibited in our circuses passed, in the thirteenth century, from Egypt to the Byzantine court, and thence over all Europe.

JUGLANS, the Walnut, a genus of plants belonging to the polyandria class, and in the natural method ranking under the fiftieth order *Amentaceæ*. See Botany.

JUGULAR, amongst anatomists, is applied to certain veins and glands of the neck. See Anatomy.

JUGULARES, in the Linnæan system, is the name of an order or division of fish, the general character of which is, that the ventral fins are placed before the pectoral. See Ichthyology.

JUGUM, an humiliating mode of punishment inflicted by the victorious Romans upon their vanquished enemies. It was done in this way: They set up two spears, and laying a third across, in the form of a gallows, they ordered those who had surrendered themselves to pass under this ignominious erection, without arms or belts. None suffered this disgrace of passing *sub jugo* except such as had been obliged to surrender.

JUGURTHA, king of Numidia, was son of Mastanabal and a concubine; he was also grandson of Masinissa. The principal events of his life are included between 134 and 106 B. C. He was educated, along with his cousins Adherbal and Hiempsal, the sons of his uncle Micipsa, and began at an early period to exhibit such strong symptoms of ambition, that Micipsa felt much uneasiness respecting the succession of his sons to the throne. With a view, therefore, of getting rid of Jugurtha, when the Romans sent for auxiliaries in their war against Numantia, B. C. 134, Jugurtha was despatched at the head of a body of troops, and it was hoped that he might fall in some engagement with the enemy. The event did not correspond with his expectation; for he returned to Micipsa with letters from Scipio, who commanded the Roman troops, full of the most flattering expressions. When Micipsa found his end approaching, he saw it necessary to change his policy in respect to Jugurtha; and, hoping that gratitude might prevent him from gratifying his ambitious views, he named him joint heir with his two sons Adherbal and Hiempsal. But the third part of the kingdom did not satisfy Jugurtha, who began immediately to take measures for getting rid of his cousins. Hiempsal was murdered, and Adherbal only saved his life by a timely flight, B. C. 112. The fugitive prince had recourse to Rome, where the venality of the nobility had become proverbial, and made application to the senate. The bribes of Jugurtha prevented an adverse decision, and commissioners were appointed to divide the kingdom equally between the two princes. The most fertile and populous part of Numidia was given to Jugurtha, who, finding all his schemes succeed, began without delay to make war on his cousin. Having shut him up in the town of Cirta, Jugurtha induced him to surrender upon promise of his life, but, in contempt of all the laws of honour, put him to death. This atrocious proceeding roused the indignation of the people of Rome, and the senate could no longer withstand the popular feeling. War was declared, and carried on with vigour (B. C. 111), till the Numidian prince succeeded in bribing the generals sent against him. Peace was at last granted to him upon very advantageous conditions, and he had even the boldness to come to Rome, where he caused Massiva to be murdered, whose claims to his kingdom began to give him uneasiness. Nothing could now save him from the indignation of Rome, and he was ordered immediately to quit Italy. It was on leaving Rome that he is said to have frequently looked back on it, and to have exclaimed, "Urbs venalis et mature peritura si emptorem inveniet." The war began B. C. 110, but with little success to the Romans. Jugurtha defeated Aulus, who had been sent against him, and made his troops pass under the yoke. Metellus was next despatched to Africa, who, not allowing himself to be gained either by the promises or bribes of Jugurtha, soon reduced him to great difficulties. He took many of his chief cities, B. C. 109, and compelled Jugurtha to apply for assistance to the Gætulians and Moors. Marius followed up the war with still greater vigour, till Jugurtha was obliged at last to fly to Bocchus, who delivered him up to Sylla, then quæstor of Marius, B. C. 106. He was carried to Rome, where he was led in triumph

Juice.

by Marius, and afterwards perished in prison. His life has been written by Sallust, and some facts may be found in Plutarch's *Life of Marius* (c. 3), and Sylla (c. 10), and Diodorus Siculus, *Fragm.* tom. x. p. 141.

JUICE denotes the sap of vegetables, or the liquors of animals.

The juices of several plants are expressed to obtain their essential salts, and for several medicinal purposes, with intention either to be used without further preparation, or to be made into syrups and extracts. The general method of extracting these juices is, by pounding the plant in a marble mortar, and then by putting it into a press. In this way is obtained a muddy and green liquor, which generally requires to be clarified. The juices of all plants are not extracted with equal ease. Some plants, even when fresh, contain so little juice, that water must be added whilst they are pounded, otherwise scarcely any juice could be obtained by expression. Other plants, which contain a considerable quantity of juice, furnish by expression but a small quantity of it, because they contain also much mucilage, which renders the juice so viscid that it cannot flow. Water must also be added to these plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method are not, properly speaking, one of their principles, but rather a collection of all the proximate principles of plants which are soluble in water; such is the saponaceous extractive matter, the mucilage, the odoriferous principle, and the saline and saccharine substances; all of which are dissolved in the water of the vegetation of the plants. Besides these matters, the juice contains some part of the resinous substance, and the green colouring matter, which in almost all vegetables is of a resinous nature. These two latter substances not being soluble in water, are only interposed between the parts of the other principles which are dissolved in the juice, and consequently disturb its transparency. They nevertheless adhere together in a certain degree, and so strongly in most juices, that they cannot be separated by filtration alone. When therefore these juices are to be clarified, some previous preparations must be used by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are spontaneously clarified by rest and gentle heat. The juices of most antiscorbutic plants abounding in saline volatile principles, may be disposed to filtration merely by immersion in boiling water; and as they may be contained in close bottles, whilst they are thus heated in a water bath, their saline volatile part, in which their medicinal qualities chiefly consist, may thus be preserved. Fermentation is also an effectual method of clarifying juices which are susceptible of it; for all liquors which have fermented clarify spontaneously after fermentation. But this method is not used to clarify juices, because many of them are susceptible of only an imperfect fermentation, and because the qualities of most of them are injured by that process. The method of clarification most generally used, and indispensably necessary for those juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with and coagulate their mucilage, and separates it from the juice in form of scum, together with the greatest part of the resinous and earthy matters which disturb its transparency. And as any of these resinous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may be easily separated by filtration.

The juices, especially before they are clarified, contain almost all the same principles as the plant itself; because, in the operation by which they are extracted, no decomposition happens, but every thing remains, as to its nature, in the same state as in the plant. The principles contained in the juice are only separated from the grosser oily, earthy, and resinous parts, which compose the solid matter that remains under the press. These juices, when well prepared, have therefore the same medicinal qualities as the plants from which they are obtained. They must evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in those respects.

Juice.

Most vegetable juices coagulate when they are exposed to the air, whether they are drawn out of the plant by wounds, or naturally run out; though what is called naturally running out is generally the effect of a wound in the plant, from a sort of canker, or some other internal cause. Different parts of the same plant yield different juices. The same veins, in their course through the different parts of the plant, yield juices of a different appearance. Thus the juice in the root of the cow-parsnip is of a brimstone colour, but in the stalk it is white.

Amongst those juices of vegetables which are clammy and readily coagulate, there are some which readily break with a whey. The great wild lettuce, with the smell of opium, yields the greatest plenty of milky juice of any known British plant. When the stalk is wounded with a knife, the juice flows out readily like a thick cream, and is white and ropy; but if these wounds are made at the top of the stalks, the juice that flows out of them is dashed with a purple tinge, as if cream had been sprinkled over with a few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it separates, and the thin whey swims at the top. The whey or thin part of this separated matter is easily pressed out from the curd by squeezing between the fingers, and the curd will then remain white; and on washing with water it becomes like rags. The purple whey (for in this is contained all the colour) soon dries into a purple cake, and may be crumbled between the fingers into a powder of the same colour. The white curd being dried and kept for some time, becomes hard and brittle. It breaks with a shining surface like resin, and is inflammable, taking fire at a candle, and burning all away with a strong flame. The same thick part being held over a gentle heat, will draw out into tough, long threads, melting like wax. The purple cake made from the whey is quite different from this; and when held to a candle scarce flames at all, but burns to a black coal. The whole virtue of the plant seems also to consist in this thin part of its juice; for the coagulum or curd, though looking like wax or resin, has no taste at all; whereas the purple cake made from the serum is extremely bitter, and of a taste somewhat resembling that of opium.

Of the same kind with the wild lettuce are the throatwort, spurge, and many other plants. These are all replete with a milky juice which separates into curds and whey like that already described. But this, though a common law of nature, is not universal; for there are many plants which yield the like milky juices without any separation ensuing upon their extravasation. The white juice of the sonchus never separates, but dries into an uniform cake; the common red wild poppy bleeds freely with a milky juice; and the heads or capsules of seed bleed not less freely than the rest of the plant, even after the flower is fallen. The juice, on being received into a shell or other small vessel, soon changes its white to a deep yellow colour, and dries into a cake which seems resinous and oily, but no whey separates from it. The tragopogon, or goat's beard, when wounded, exudes freely a milky juice; it is at first white, but becomes immediately yellow, and then more and more red, till at length it is wholly of a dusky red. It never separates, but dries together into one cake; and is oily and resinous, but of an insipid taste. The great bindweed also exudes freely a white juice; the flowers, as well as the stalks and leaves, affording this liquor. It is of a sharp taste; and, as many of the purging plants are of this class, it would be worth trying whether this milk is not purgative.

These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the great celandine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey separating from it. Another yellow juice is yielded by the seed-vessels of the yellow centaury in the month of July, when the seeds are full grown. This is very clammy; it soon hardens altogether into a cake without any whey separating from it. It sticks to the fingers like bird-lime, is of the colour of pale amber, and will never become harder than soft wax if dried in the shade; but if laid in the sun it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleasant smell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept several years will still be soft and clammy, drawing out into threads or half-melted resin.

Other kinds of juices very different from all these are those of a gummy nature. Some of these remain liquid a long time, and are not to be dried without the assistance of heat; and others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubarb leaves soon hardens, and is afterwards soluble in common water, and sparkles when put into the flame of a candle. The clusters of the common honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the *ros solis* are all terminated by large bladders of a thin, watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the sun all day. In the centre of each of these dew-drops there is a small red bladder, which stands immediately on the summit of the red hair, and contains a purple juice which may be squeezed out of it. The pinguicula, or butterwort, has also a gummy matter on its leaves, in much greater quantity than the *ros solis*.

Some plants yield juices which are manifestly of an oily nature. These, when rubbed, are not at all of a clammy nature, but make the fingers glib and slippery, and do not at all harden on being exposed to the air. If the stalk of elecampane be wounded, there flows out an oily juice swimming upon a watery one. The stalks of the hemlock also afford a similar oily liquor swimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dogberry tree, and the fruit of the olive, when wounded, show their oil floating on the watery juice. Some of these oily juices, however, harden into a kind of resin. Our ivy yields such a juice very abundantly; and the juice of the small purple-berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greasy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or sticking, but melts in handling into a sort of oil, which in process of time hardens and crusts upon the wounds, and looks like brown sugar. It burns with a lasting flame, and smells very strong. The tops of the wild lettuce, and the leaves growing near the tops, if examined with a magnifying glass, show a great number of small bladders or drops of an oily juice of a brownish colour, hardening into a kind of resin; they are easily wiped off when of any size, and are truly an oily juice a little hardened. It is probable, also, that the fine blue flour or powder called the *bloom*, upon the surface of our common plums, is no other than such an oily juice exudating from their pores in small particles, and hardening into a sort of resin.

JUIST, an island in the German Ocean, belonging to the Hanoverian province of East Friesland. It has a Lutheran church, and 280 inhabitants, who live by fishing, and as mariners. Long. 6. 54. 53. E. Lat. 53. 41. 11. N.

JUJUBES, in the *Materia Medica*, the name of a fruit of the pulpy kind, produced on a tree which Linnæus considers as a species of rhamnus. See RHAMNUS.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and are scarcely at all heard of in prescription, or to be met with except in our shops.

JUL, or JOL, a Gothic word, signifying a "sumptuous treat," and particularly applied to a religious festival, first amongst the heathens, and afterwards amongst the Christians. By the latter it was given at Christmas, which is still known under the name of *Iul*, or *Yool*, in Denmark, Norway, Iceland, Sweden, and even in Scotland; and hence the month of Januarius was by the Saxons styled *Giuli*, or the "Festival." As this feast had originally been dedicated by our heathen ancestors to the sun, their supreme deity, so the Christians, for the purpose of engaging the minds of their Ethnic or gentile brethren, ordered that it should be celebrated in memory of the birth of Christ; and thus it has been through ages a feast of joy and entertainment. We are indebted to Procopius for the first account of this feast.

JULAMERICK, a district in the east of Kurdistan, bounded by Armenia on the north, and by the pachalic of Bagdad on the south. It is a hilly country throughout, producing in some places a quantity of corn, and in all abundance of pasturage. Its chief town bears the name of the province, and there are, besides, numerous villages. It contains a thousand inhabitants, and is situated on the banks of the Hakiar. It is defended by a citadel of stone, and is a hundred and twenty miles east-south-east of Betlis.

JULEP, in *Pharmacy*, a medicine composed of some proper liquor and a syrup or sugar, of extemporaneous preparation, without decoction.

JULIAN, the famous Roman emperor, styled *the Apostate*, because he professed the Christian religion before he ascended the throne, and afterwards, having embraced paganism, endeavoured to abolish Christianity. For this purpose, however, he made no use of violence. He knew that such measures had always rendered it more flourishing, and therefore behaved with a polite mildness to the Christians, recalling all who had been banished on account of their religion under the reign of Constantius. He undertook to pervert them by his caresses, and by temporal advantages or mortifications; forbidding Christians to plead before courts of justice, or to enjoy any public employments. He even prohibited their teaching polite literature, well knowing the great advantages which they drew from profane authors in their attacks upon paganism and irreligion. Though he on all occasions showed a sovereign contempt for the Christians, whom he called *Galileans*, yet he was sensible of the advantage they obtained by their virtue and the purity of their manners; and therefore he incessantly proposed their example to the pagan priests. At last, however, when he found that all other methods failed, he gave public employments to the most cruel enemies of the Christians, when the cities in most of the provinces were filled with tumults and seditions, and many of them were put to death. It has been pleaded by Julian's apologists, however, that the behaviour of the Christians afforded sufficient excuse for most of his proceedings against them; that the animosities amongst themselves furnished him with the means; that they were continually prone to sedition, and made a merit of insulting the public worship; and, finally, that they made no scruple of declaring, that want of numbers alone prevented them from engaging in open rebellion. Historians mention, that Julian attempted to prove the falsehood of our Lord's prediction with respect to the temple of Jerusalem; and resolved to have that edifice rebuilt by the Jews, about three centuries after its destruction by Titus; but all their endeavours served only the more perfectly to verify what had been foretold by Jesus Christ; for when the Jews, who had assembled from all parts to Jerusalem, were digging the foundations, flames of fire burst forth and consumed the workmen. However, the Jews, who were obstinately bent on accomplishing that work, made several attempts; but it is said that all who endeavoured to lay the foundation perished by these flames, which at last obliged them entirely to abandon the work. Julian having been mortally wounded in a battle with the Persians, is said to have caught in his hand some of the blood which flowed from his wound, and throwing it towards heaven, to have cried, "thou, Galilean, hast conquered." But notwithstanding this popular report, Theodoret relates, that Julian discovered a different disposition; and employed his last moments in conversing with Maximus the philosopher upon the dignity of the soul. He died the following night, at the age of thirty-two. For an account of his reign and exploits, see CONSTANTINOPOLITAN HISTORY.

No prince was ever more variously represented by different authors, on which account it is difficult to form a true estimate of his character. It must, however, be acknowledged, that he was learned, liberal, temperate, brave, vigilant, and a lover of justice; but, on the other hand, he had apostatised to paganism; he was a bitter enemy of the Christian religion; and he was also a persecutor, though not of the most sanguinary class. There have been preserved several of his discourses or orations; some of his letters; a treatise entitled *Misopogon*, which is a satire on the inhabitants of Antioch; and some other pieces, all written in an elegant style. They were published in Greek and Latin by Father Petau in 1630, in 4to; and Spanheimius published a fine edition in 1690, in folio. His most celebrated work was that composed against the Christians, of which some fragments are contained in Cyril's refutation.

JULIAN *Period*, in *Chronology*, a period so called, as being adapted to the Julian year. See CHRONOLOGY.

JULIAN, *St*, a town of the arrondissement of Joigny, in the department of the Yonne, in France. It contains 2340 inhabitants, who carry on considerable trade in wine, and manufacture woollen cloths.

JULIERS, a fortified city of Prussia, the capital of a circle of the same name, in the province of Aachen or Aix-la-Chapelle. It stands on the river Roer, the water of which fills the ditches that surround the walls. The citadel is a very strong frontier defence. It contains 460 houses, and 3290 inhabitants. The trade is inconsiderable. Long. 6. 25. E. Lat. 50. 55. N.

JULIO ROMANO. See ROMANO.

JULIUS CÆSAR. See CÆSAR.

JULIUS II. a pope, remarkable for his warlike disposition, and his political negotiations. By the latter, he induced the principal powers of Europe to unite with him against the republic of Venice, in the confederacy called *the league of Cambray*, signed in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII. king of France, and appeared in person, armed cap-á-pied, at the siege of Mirandola, which place he took by assault in 1511. But proceeding to excommunicate Louis, the king wisely turned his own weapons against him, by calling a general council at Pisa. The pope having refused to appear, was declared to be suspended from the holy see; and Louis, in his turn, excommunicated the pontiff, who died soon afterwards, in the year 1512. He built the famous church of St Peter at Rome, and was a patron of the polite arts.

JULIUS *Vicus*, in *Ancient Geography*, a town of the Nemetes, in Gallia Belgica, situated between the Tres Tabernæ and Noviomagus. It is now *Gemersheim*, a town of the Lower Palatinate, on the west side of the Rhine. Long. 15. 8. E. Lat. 49. 12. N.

JULIUS *Pollux*. See POLLUX.

JULY, the seventh month of the year, during which the sun enters the sign Leo. The word is derived from the Latin *Julius*, the surname of Cæsar the dictator, who was born in it. Mark Antony first gave this month the name *July*, which before was called *Quintilis*, as being the fifth month of the year in the old Roman calendar established by Romulus, which began in the month of March. For the same reason, August was called *Sextilis;* and September, October, November, and December, still retain the names of their original rank. On the 19th day of this month the dog-days are commonly supposed to commence, when, according to Hippocrates and Pliny, the sea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and languish.

JULY-*Flowers*. See DIANTHUS, BOTANY.

JUMBASIER RIVER, a town of Hindustan, in the province of Gujerat, and district of Broach. It exports to Bombay and other places, cotton, grain, oil, and piece-goods. The tide rises from five to six fathoms. It is twenty-eight miles from the town of Broach. Long. 72. 58. E. Lat. 22. 5. N.

JUMNA. This celebrated river takes its rise in the Himalaya Mountains, probably on the southern side, where the Ganges has its rise, though its source has never been accurately explored. It flows through the province of Serinagur, in a southern direction, in a line nearly parallel to the Ganges, from which, at the village of Gurudwar, in latitude 32. 22. north, it is only forty miles distant, and is between 200 and 300 yards broad, after emerging from the mountains. The Jumna enters Hindustan in the province of Delhi, and directs its course, at the distance of sixty or seventy miles, in a parallel line to that of the Ganges, until, after passing the cities of Delhi and Agra, it falls into the Ganges at Allahabad, in which, as the holier and rather the larger stream, its name is absorbed. The length of the stream, including its windings, is estimated at 780 miles. The Jumna is only useful as a military barrier to the British territories during the rainy season, when all field operations are impracticable. At this period it may be navigated by flat-bottomed boats of considerable burden; but at other times it is of no utility to commerce. Above its junction with the Chumbul, or ten miles below the fort of Etayeh, it is fordable, except for a few weeks during the rainy season. From Calpee to its junction with the Ganges there is no obstruction, and only one place where, in the dry season, the passage is rendered difficult by a bank of limestone. It is mentioned by Bishop Heber that its waters act on strangers like the Cheltenham waters.

JUNAGUR, a town of Hindustan, in the province of Gujerat, possessed by an independent native chief, now one of the British allies. He and other chiefs engaged, in 1808, with the Bombay government, not to connive at piracy, and to permit a free and open commerce with the British vessels, on paying the stipulated duties.

JUNCI LAPIDEI, the name given by old authors to a species of coral of the tubularia kind, and composed of a congeries of small tubules. See HELMINTHOLOGY.

JUNCTURE, a joining or closing of two bodies. See JOINT.

Juncture, in *Oratory*, is a part of composition particularly recommended by Quintilian, and denotes such an attention to the nature of the vowels and consonants, in the connection of words, with reference to their sound, as will render their pronunciation most easy and pleasant, and best promote the harmony of the sentence. Thus the coalition of two vowels, occasioning a hollow and obscure sound, and likewise of some consonants, rendering it harsh and rough, should be avoided; nor ought the same syllable to be repeated at the beginning and end of words, because thereby the sound becomes harsh and unpleasant. The first verse in Virgil's *Æneid* is an example of juncture.

JUNCUS, the Rush, a genus of plants belonging to the hexandria class, and in the natural method ranking under the fifth order, *Tripetaloideæ*. See Botany.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive *a Junone;* and hence Ovid, in the sixth of his *Fasti*, makes the goddess say,

Junius a nostro nomine nomen habet.

Others rather derive it *a junioribus*, this being for young people what the month of May was for old ones. In this month is the summer solstice.

JUNGERPOOR, a town of Hindustan, possessed by native chiefs, situated in the province of Gujerat, ninety miles north-east from Ahmedabad. These chiefs are occasionally tributary to the Mahrattas. Long. 73. 38. E. Lat. 23. 49. N.

JUNGEYPOOR, a town of Bengal, district of Ranjeshy, situated on the eastern bank of the Bhagerutty River. It is the principal silk station of the East India Company. This establishment was erected in 1773, and in 1803 about 3000 persons were employed. The method employed in spinning the silk is the same as that employed in Italy, which was introduced as early as in 1762, by some natives of Italy sent over for that purpose by the Company. The worms are bred all over the country, under the care of women and children. The soil is favourable to the growth of the mulberry. The inhabitants are obliged to sell the choice cocoons to the Company's agent. The employment has no deleterious effects, although the smell is excessively disagreeable. It is seventeen miles north by west from Moorshedabad. Long. 88. 13. E. Lat. 24. 28. N.

JUNGLEBARRY, a town in the province of Bengal, district of Mymansingh, sixty miles north-east from Dacca. Long. 90. 42. E. Lat. 24. 27. N.

JUNIUS, Adrian, one of the most learned men of the age in which he lived, was born at Hoorn, in Holland, in the year 1511. He travelled into all parts of Europe, and practised physic with reputation in England, where, amongst other works, he composed a Greek and Latin lexicon, to which he added considerably above six thousand words; an *Epithalamium* on the marriage of Queen Mary with King Philip of Spain; and *Animadversa et de Como Commentarius*, which is the most applauded of all his works. He died in 1575.

Junius, *Francis*, professor of divinity at Leyden, was born at Bourges in 1545, and studied some time at Lyons. Bartholomew Aneau, who was principal of the college in that city, gave him excellent instructions as to the right method of prosecuting his studies. He was employed in public affairs by Henry IV., and at last invited to Leyden to be professor of divinity; an employment which he discharged with honour, till he was snatched away by the plague in 1602. Du Pin says he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin version of the Hebrew text of the Bible; and he also published Commentaries on the greater part of the Holy Scriptures, besides many other works, all in Latin.

Junius, *Francis*, or *Francis du Jon*, the son of the preceding, was born at Heidelberg in 1589. He at first designed to devote himself to a military life; but after the truce concluded in 1609, he applied himself entirely to study. He came to England in 1620, and lived thirty years in the Earl of Arundel's family. He was greatly esteemed, not only for his profound erudition, but also for the purity of his manners; and he was so passionately fond of the study of the northern languages, that being informed there were some villages in Friesland where the ancient language of the Saxons was preserved, he went and lived two years in that country. He returned to England in 1675; and, after spending a year at Oxford, retired to Windsor, in order to visit Vossius, at whose house he died in the year 1677. The university of Oxford, to which he bequeathed his manuscripts, erected a very handsome monument to his memory. He wrote, 1. *De Pictura Veterum*, which is admired by the learned, the best edition being that of Rotterdam in 1694; 2. An Explication of the old Gothic manuscript called the *Silver Manuscript*, because the four gospels are there written in silver Gothic letters, published with notes by Thomas Mareschal or Marshal; 3. A large commentary on the Harmony of the four Gospels by Tatian, which is still in manuscript; 4. A Glossary in five languages, in which he explains the origin of the northern languages, published at Oxford in 1745, in folio.

JUNK, in nautical language, a name given to any remnant or piece of old cable, which is usually cut into small portions, for the purpose of making points, mats, gaskets, sennit, and the like.

JUNKSEYLON, a considerable island on the western coast of the Malay peninsula, and situated at the south-east extremity of the Bay of Bengal. It is divided from the continent by a narrow isthmus of sand about a mile in length and half a mile in breadth, which is covered only at high water, the tide rising in the springs about ten feet. The island is about forty miles in length by fifteen in breadth, and has several small islands near it from one to six miles in circumference. There is another island sixteen miles east, named Pulo Pinjang, or Long Island, being twenty-three miles in length by eight in breadth, and divided from the main by a strait having two fathoms of water in the narrowest part. On the north side of the island is an excellent harbour, called Popra, which may be entered over a mud bar, during the spring-tides, by ships drawing twenty feet water. The anchorage round the island is generally good, with a mud bottom. A considerable trade was formerly carried on here, previously to the establishment of Prince of Wales' Island, in the Buggess prows, who resorted to Junkseylon in great numbers, and brought various mixed cargoes to sell for tin. It is still occasionally visited by country ships from Calcutta in their voyage eastward, which import coarse cutlery, China-ware, iron in bars, looking-glasses, opium, piece-goods, steel in faggots, tobacco, woollens, &c. From Prince of Wales' Island also are imported opium and piece-goods, and in return tin, edible bird-nests, which are found on the rocky coasts of the island, biche-de-mer, and elephants' teeth, are received. This island is noted for the production of tin, which is raised by the natives, and smelted by a Chinese, who farms the privilege from government. In 1782, when it was visited by numerous native traders, the mines yielded an average of 500 tons per annum. All kinds of coin are current, but the preference is given to Spanish dollars. Certain pieces of tin also circulate, which are shaped like the under half of a cone, and weigh about three pounds. But as the population, owing to the unsettled state of the country, has since decreased to about 6000 inhabitants, and the Siamese have mines closer to their capital, a very small supply is now derived from the island, not exceeding 46,600 pounds a year. The miners dig pits of from twelve to twenty feet deep; but seldom venture on a lateral shaft; and the ore is generally found in round or oblong masses, with well-defined crystals, and in quartz, or embedded in masses of half-decomposed granite.

Junkscylon enjoys a good climate. The heats are never violent. The rains begin in July, and continue to November, with frequent intermissions; after which fine weather succeeds, accompanied by cold north-easterly winds at night. There are no horses on the island, bullocks and buffaloes being here used for labour. Persons of consequence travel on elephants, which are brought from Mergui. The island breeds wild hogs and deer, a few tame goats, and poultry; but no sheep, domestic dogs, nor cats.

JUNNERE, a town of Hindustan, in the province of Aurungabad, forty miles north-north-east from Poonah. Long. 73. 51. E. Lat. 19. 3. N.

JUNOA, a town of Hindustan, in the province of Bahar, and district of Chuta Nagpoor, 183 miles north-west from Calcutta. Long. 85. 43. E. Lat. 23. 23. N.

JUNO, in Pagan worship, was the sister and wife of Jupiter, the goddess of kingdoms and riches, and was styled the Queen of Heaven. She presided over marriage and child-birth, and was represented as the daughter of Saturn and Rhea. She married Jupiter, but was not the most complaisant of wives; for, according to Homer, that god was sometimes obliged to make use of all his authority to keep her in due subjection; and the same author observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles on her hands, whilst all the other deities looked on without a possibility of helping her. However, her jealousy made her frequently find opportunities of interrupting her husband in the course of his amours, and prompted her to punish with unrelenting fury Europa, Semele, Io, Latona, and the rest of his mistresses. Juno, as the queen of heaven, preserved great state. Her usual attendants were Terror and Boldness, Castor, Pollux, and fourteen nymphs; but her most faithful follower was the beautiful Iris, or the rainbow. Homer describes her as riding in a chariot adorned with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted as drawn by peacocks. She was represented in her temple at Corinth seated upon a throne, with a crown on her head, a pomegranate in one hand, and in the other a sceptre with a cuckoo on its top. This statue was of gold and ivory. Some mythologists suppose that Juno signifies the air; and others, that she was the Egyptian Isis, who, being represented under various figures, was by the Greeks and Romans represented as so many distinct deities.

JUNONALIA, a festival observed by the Romans in honour of Juno. It was instituted on account of certain prodigies which happened in Italy, and was celebrated by matrons. In the solemnity two white cows were led from the temple of Apollo into the city through the gate called *Carmentalis*, and two images of Juno, made of cypress, were borne in procession. Then marched twenty-seven girls, habited in long robes, singing a hymn to the goddess; next came the decemviri, crowned with laurel, in vestments edged with purple. This pompous company, proceeding through the *Vicus Jugarius*, performed a dance in the great field of Rome; and thence they proceeded through the *Forum Boarium* to the temple of Juno, where the victims were sacrificed by the decemviri, and the cypress images were left standing. This festival is not mentioned in the *Fasti* of Ovid, but is fully described by Livy (lib. vii. dec. 3). The hymn used upon the occasion was composed by Livius the poet.

JUNTO, or JUNTA, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, and requiring secrecy. In Spain and Portugal it signifies the same as convention, assembly, or board, amongst us. Thus, we meet with the junta of the three estates, of commerce, of tobacco, and the like.

JUPITER, the supreme god of the ancient Pagans. The theologists, according to Cicero, reckoned three Jupiters, the first and second of whom were born in Arcadia; and of these two, the one sprang from Æther, and the other from Cœlus. The third Jupiter was the son of Saturn, and born in Crete, where they pretended to show his sepulchre. Cicero in other places speaks of several Jupiters, who reigned in different countries. The Jupiter by whom the poets and mythologists understand the supreme god, was the son of Saturn, king of Crete. He would have been devoured by his father as soon as born, had not his mother Rhea substituted a stone instead of the child, which Saturn immediately swallowed. Saturn took this method to destroy all his male children, because it had been foretold by Cœlus and Terra that one of his sons would deprive him of his kingdom. Jupiter, being thus saved from his father's jaws, was brought up by the Curetes in a den on Mount Ida. Virgil tells us that he was fed by the bees; and, out of gratitude for this service, he changed them from an iron to a golden colour. Some say that his nurses were Amalthæa and Melissa, who gave him goat's milk and honey; and others, that Amalthæa was the name of the goat which nourished him, and which, as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, which brought him ambrosia from Oceanus; and by an eagle, which carried nectar in his beak from a steep rock; services for which he rewarded the former, by making them the foretellers of winter and summer; and the latter, by giving him immortality, and making him his thunderbearer. When grown up, he drove his father out of heaven, and divided the empire of the world with his brothers. For himself, he reserved heaven and earth; Neptune had allotted to him the sea and waters; and Pluto the infernal regions. The Titans undertook to destroy Jupiter, as he had done his father. These Titans were giants, the sons of Titan and the Earth. They declared war against Jupiter, and heaped mountains upon mountains in order to escalade heaven; but their efforts were unsuccessful, Jupiter overthrew them with his thunder, and shut them up under the waters and mountains, from which they were not able to escape. Jupiter had several wives. The first of these, named Metis, he is said to have destroyed in a most extraordinary manner. His second was Themis; the name of his third is not known; but his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which, to shun the violence of a storm, fled for shelter to her lap. He was the father of the Muses and Graces, and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull, to carry off Europa; into a swan, to abuse Leda; into a shower of gold, to corrupt Danäe; and into several other forms to gratify his passions. He had Bacchus by Semele, Diana and Apollo by Latona, and was the father of Mercury and the other gods. The heathens in general believed that there was but one supreme God; but when they considered this one great being as influencing the affairs of the world, they gave him as many different names; and hence proceeded their variety of nominal gods. When he thundered or lightened, they called him

Jupiter; when he calmed the sea, Neptune; when he guided their councils, Minerva; and when he gave them strength in battle, Mars. In process of time they used different representations of this Jupiter, and considered them, vulgarly at least, as so many different persons. They afterwards regarded each of them in different views; thus, the Jupiter who showered down blessings was called the *Kind*; and the Jupiter who punished, the *Terrible*. There was also one Jupiter for Europe, and another for Africa. In Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans; nay, there was scarcely a town or hamlet perhaps in Italy that had not a Jupiter of its own; but the Jupiter of Terracina, or Jupiter Anxur, represented in medals as young and beardless, with rays round his head, resembled Apollo more than the great Jupiter of the Capitol. In this way Jupiter at length had different temples and different characters almost everywhere. At Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the Olympian Jupiter; and at Rome, the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the best and greatest, *Jupiter optimus maximus*. The figure of this Jupiter was represented, in his chief temple on the Capitoline Hill, as sitting on a curule chair, with the *fulmen* or lightning in one hand, and a sceptre in the other. This *fulmen*, in the figures of the old artists, was always adapted to the character under which they required to represent Jupiter. If his appearance was to be mild and calm, they gave him the comic *fulmen*, or bundle of flames wreathed close together, held down in his hand; when punishing, he held up the same figure, with two transverse darts of lightning, sometimes with wings added to each side of it to denote its swiftness (this was called by the poets the three-forked bolt of Jove); and when he was going to do some exemplary execution, they put in his hand a handful of flames, all let loose in their utmost fury, and sometimes filling both his hands with flames. The superiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavoured to express in his countenance; particular attention being paid to the head of hair, the eyebrows, and the beard. There are, on ancient seals, several heads of the mild Jupiter; where his face has a mixture of dignity and ease in it, admirably described by Virgil (*Æn.* i. ver. 256). The statues of the Terrible Jupiter were generally of black marble, as those of the former were of white; the one sitting with an air of tranquillity, the other standing, more or less disturbed. The face of the one is pacific and serene, of the other angry or clouded. On the head of the one the hair is regular and composed; in the other it is so dishevelled that it falls half way down the forehead. The face of the Jupiter Tonans resembles that of the Terrible Jupiter; he is represented on gems and medals as holding up the triple bolt in his right hand, and standing in a chariot which seems to be whirled on impetuously by four horses. Thus he is also described by the poets (Ovid, *Deian. Herc.* v. 28; Horace, lib. i. od. 4, v. 8). Jupiter, as the intelligence presiding over a single planet, is represented only in a chariot and pair; upon all other occasions, if represented in a chariot, he is always drawn by four horses. Jupiter is well known as the chief ruler of the air, whose particular province it was to direct the rains, the thunders, and the lightnings. As the dispenser of rain, he was called *Jupiter Pluvius*, under which character he is exhibited seated in the clouds, holding up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand upon the earth, whilst the *fulmen* is held down in his left. The wings that are given to him relate to his character of presiding over the air; his hair and beard in the Antonine pillar are all spread down by the rain, which descends in a sheet from him, and falls for the refreshment of the Romans; whilst their enemies are represented as struck with the lightnings, and lying dead at their feet.

Some are of opinion that the fable of Jupiter includes a great part of the history of Noah and his three sons, and that Saturn is Noah, who saw all mankind perish in the waters of the deluge, and who, in some sort, swallowed them up, by not receiving them into the ark. Jupiter is Ham; Neptune, Japheth; and Shem, Pluto. The Titans, it is thought, represent the old giants, who built the tower of Babel, and whose pride and presumption God had confounded, by changing their language, and pouring out the spirit of discord and division amongst them. The name of *Jupiter*, or *Zeus*, or *Jovis Pater*, is thought to be derived from Jehovah; and in medals we meet with *Jovis* in the nominative as well as oblique cases, thus, *Jovis custos*, *Jovis propugnator*, *Jovis stator*. To the name *Jovis* was added *pater*; and afterwards, instead of *Zeus* or *Jovis Pater*, they used *Jupiter* by abbreviation.

The name of Jupiter was not known to the Hebrews till the reign of Alexander the Great, and the kings his successors. Antiochus Epiphanes commanded the idol of Jupiter Olympius to be placed in the temple at Jerusalem; and that of Jupiter the defender of strangers in the temple on Mount Gerizim (2 Macc. vi. 2). Whilst St Paul and St Barnabas were at Lystra, they were taken for gods, because they cured one who had been lame from his birth, and that by an expression only; St Paul was taken for Mercury, by reason of his eloquence, and St Barnabas for Jupiter (Acts, xiv. 11, 12), on account of his goodly mien.

JUPITER, ♃, in *Astronomy*, one of the superior planets, remarkable for its brightness, and which by its proper motion revolves round the earth in about twelve years. See ASTRONOMY.

JURA, one of the Hebrides, or Western Islands of Scotland, lying opposite to Knapdale in Argyleshire, is supposed to be about thirty-four miles in length and ten in breadth. It is the most rugged of all the Hebrides, and is composed chiefly of vast mountains, naked, and without a possibility of cultivation. See SCOTLAND.

JURA, one of the departments of the north-east of France. It is formed out of what was formerly called Higher Burgundy, is bounded on a part of its eastern frontier by Switzerland, and on all other sides by French departments. It is about sixty-six miles in length from north to south, and about thirty-eight in breadth from east to west, comprehending 1388 square miles. The department may be classed under three heads; first, the plains on the western side, which are fertile; second, the first steps of the mountains, which suddenly rise like a wall, extending from ten to twelve miles, above which is an extensive plateau mixed with hills, between which are some valleys, which, though stony, are of moderate fertility; the third division, which comprises nearly two thirds of the whole, is a mountainous district, but none of its summits exceed 5500 feet in height. These mountains are on the eastern side of the department; the most remarkable are the Reculet, 5200 feet; the Dole, 4950 feet; and the Poupet, somewhat lower. The woods, according to the *Description Topographique et Statistique*, cover one quarter of the whole surface. This department is the source of the small rivers Tansche, Dorrain, Deffoy, and some others; but a great part is watered by the Doubs and the Ain, and there are within it several lakes. The climate varies with the elevation, and the snow in the eastern parts is often so deep as to prevent all communication. The different parts produce wheat, barley, maize, and buck-wheat; a little excellent and much middling wine, abundance of fuel, and some very good cattle, especially horses. There are some mines of iron, and manufactures of various articles from it. The department is divided into four arrondissements, and subdivided into thirty-two cantons and 728 communes, inhabited by 292,880 persons, all of whom adhere to the catholic religion.

JURATS, Jurati, magistrates resembling aldermen, appointed for the government of several corporations. Thus we meet with the mayor and jurats of Maidstone, Rye, Winchelsea. Jersey has also a bailiff, and twelve jurats, or sworn assistants, to govern the island.

JURIEU, Peter, an eminent French protestant divine, called ironically by the Catholics the Goliath of the Protestants, was born in the year 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the English church; but returning to succeed his father as pastor of a reformed congregation at Mer, in the diocese of Blois, he was made professor of divinity and Hebrew at Sedan, where he acquired great reputation. This university being taken from the Protestants, a professorship of divinity was founded for him at Rotterdam; and he was also appointed minister of the Walloon church in the same town. Being now in a place of liberty, he gave full scope to an imagination naturally warm, and applied himself to study the book of Revelation, of which he fancied that he had by a kind of inspiration discovered the true meaning; a notion which led him to form many enthusiastic conjectures. He was, moreover, so unfortunate as to quarrel with his best friends for opposing his visionary opinions, which produced violent disputes with Bayle and De Beauval. He died in 1713; and left a great number of esteemed works, the principal of which are, 1. A Treatise of Devotion; 2. Preservative against Popery, 1673; 3. A Vindication of the Morality of the Protestants against the Accusations of M. Arnauld, 1675, 1685; 4. The last Efforts of Afflicted Innocence; 5. Histoire des Dogmes et des Cultes; 6. Histoire du Calvanisme et du Papisme mise en parallèle, 1683, in three vols.; 7. Lettres Pastorales; 8. Traité de l'Unité de l'Eglise, 1688; 9. Abrégé de l'Histoire du Concile de Trente, 1683; 10. Traite de la Nature et de la Grace; and various other works. Jurieu was unquestionably a man of considerable learning, but he entertained peculiar notions of his own, and showed little toleration for the opinions of others.

JURIN, James, born in 1684, a distinguished person, who cultivated medicine and the mathematics with equal success. He was secretary to the Royal Society of London, as well as president of the College of Physicians there. He had serious disputes with Michelotti upon the momentum of running waters, with Robins upon distinct vision, and with the partisans of Leibnitz upon moving bodies or living forces. A treatise of his upon Vision is printed in Smith's Optics. He died in 1750. Jurin was a warm partisan and an active defender of the practice of inoculation, and, in several publications, established its utility by a comparison of the respective degrees of mortality occasioned by the casual and the inoculated small-pox. He was also editor of Varenius's Geography, published at the request of Newton and Bentley; and in the Works of the Learned for 1737, he carried on a controversy with Dr Pemberton in defence of Newton.

JURISCONSULTUS (contracted *ICtus*) amongst the Romans, was a person learned in the law, a master of the Roman jurisprudence, who was consulted on the interpretation of the laws and customs, and on the difficult points in law-suits. The fifty books of the Digest were compiled wholly from the answers or reports of the ancient jurisconsults; and Tribonian, in destroying the two thousand volumes from which the Code and Digest were compiled, has deprived the public of a world of things which would have thrown light upon the ancient office of the jurisconsults. We should scarcely have known any thing beyond their bare names, had not Pomponius, who lived in the second century, taken care to preserve some circumstances illustrative of their office. The Roman jurisconsults seem to have been nearly the same with our chamber counsellors, who arrived at the honour of being consulted through age and experience, but never pleaded at the bar. The pleading advocates or lawyers never became jurisconsults. In the times of the commonwealth, the advocates had by much the more honourable employment, as being in the ready way to attain the highest preferments. They then despised the jurisconsults, calling them in derision *formularii* and *legulei*, as having invented certain forms and monosyllables, in order to give their answers the greater appearance of gravity and mystery. But in process of time the latter became so much esteemed that they were called *prudentes* and *sapientes;* the judges were appointed to follow their advice; and Augustus advanced them to be public officers of the empire. Rutilius has written the lives of the most famous jurisconsults.

JURISPRUDENCE.

I.—The object of the science which is distinguished by the name of Jurisprudence, is the protection of rights.

The end of jurisprudence.

The business of the present discourse is, therefore, to ascertain the means which are best calculated for the attainment of that end.

What we desire to accomplish is, the protection of rights: What we have to inquire is, the means by which protection may be afforded.

Importance of the inquiry.

That rights have hitherto been very ill protected, even in the most enlightened countries, is matter of universal acknowledgment and complaint. That men are susceptible of happiness only in proportion as rights are protected, is a proposition which, taken generally, it is unnecessary to prove. The importance of the inquiry, therefore, is evident.

Confusion in the vulgar uses of the word right.

It is requisite, as a preliminary, to fix, with some precision, what we denote by the expression *rights.* There is much confusion in the use of this term. That disorderly mass, the Roman law, changes the meaning of the word in stating its division of the subject, *Jura Personarum* and *Jura Rerum.* In the first of these phrases, the word *Jura* means a title to enjoy; in the second, it must of necessity mean something else, because things cannot enjoy. Lawyers, whose nature it is to trudge one after another in the track which has been made for them, and to whose eyes that which is and that which ought to be have seldom any mark of distinction, have translated the jargon into English, as well as into other modern languages.

This is not all the confusion which has been incurred in the use of the word *right.* It is sometimes employed in a very general way, to denote whatever ought to be; and in that sense is opposed to wrong. There are also persons, but these are philosophers, pushing on their abstractions, who go beyond the sense in which it is made to denote generally whatever ought to be, and who make it stand for the *foundation* of whatever ought to be. These philosophers say that there is a right and a wrong, original, fundamental; and that things ought to be, or ought not to be, according as they do, or do not, conform to that standard. If asked whence we derive a knowledge

Jurisprudence.

of this right and wrong in the abstract, which is the foundation and standard of what we call right and wrong in the concrete, they speak dogmatically, and convey no clear ideas.[1] In short, writers of this stamp give us to understand that we must take this standard, like many other things which they have occasion for, upon their word. After all their explanations are given, this, we find, is what alone we are required, or rather commanded, to trust to. The standard exists. Why? Because they say it exists; and it is at our peril if we refuse to admit the assertion. They assume a right, like other despots, to inflict punishment for contumacy, or contempt of court. To be sure, hard words are the only instruments of tyranny which they have it in their power to employ. They employ them accordingly; and there is scarcely an epithet calculated to denote a vicious state of the intellectual or moral part of the human mind, which they do not employ to excite an unfavourable opinion of those who refuse subscription to their articles of faith.

...e of the ...m right.

With right, however, in this acceptation, we have at present no farther concern than to distinguish it clearly from that sense in which the word is employed in the science of jurisprudence. To conceive more exactly the sense in which it is employed in that science, it is necessary to revert to what we established in the article GOVERNMENT, with regard to the end or object of the social union; for to that every thing which is done in subservience to the social union must of course bear a reference.

In that article it appeared, that as every man desires to have for himself as many good things as possible, and as there is not a sufficiency of good things for all, the strong, if left to themselves, would take from the weak every thing, or at least as much as they pleased; that the weak, therefore, who are the greater number, have an interest in conspiring to protect themselves against the strong. It also appeared, that almost all the things which man denominates good are the fruit of human labour, and that the natural motive to labour is the enjoyment of its fruits.

That the object, then, of the social union may be obtained; in other words, that the weak may not be deprived of their share of good things, it is necessary to fix, by some determination, what shall belong to each, and to make choice of certain marks by which the share of each may be distinguished. This is the origin of right. It is created by this sort of determination, which determination is either the act of the whole society, or of some part of the society which possesses the power of determining for the whole. Right, therefore, is factitious, and the creature of will. It exists only because the society, or those who wield the powers of the society, will that it should exist; and before it was so willed it had no existence.

It is easy to see what is the standard, in conformity with which the rights in question *ought* to be constituted; meaning by *ought*, that which perfect benevolence would desire. It is the greatest happiness of the greatest number. But whether rights are constituted, that is, whether the shares of good things are allotted to each, according to this standard, or not according to this standard, the allotment is still the act of the ruling power of the community; and the rights about which the science of jurisprudence treats have this alone for the cause of their existence.

...e principal ideas ...olved in ... jurisprudential ...se of ... word.

In this complicated term it is obvious that there is involved, on the one hand, the idea of the person to whom a share is allotted, and on the other hand, an idea of the things which are allotted. The one is the owner of the right, the person to whom it belongs; the other is the object of the right, namely, the person or thing over which certain powers are given.

All rights respect objects desired.

All rights of course are rights to objects of human desire, of nothing else need shares be allotted. All objects which men desire, are desired either as the end or as means. The pleasurable state of the mind is the end, consisting of the feelings of the mind. It would be absurd, however, to speak of giving a man a right to the feelings of his own mind. The objects of desire, therefore, which are the objects of right, are not the pleasurable feelings themselves, which are desired as the end, but the objects which are desired as the means to that end.

The objects of rights are twofold.

Objects of desire, as means to that end, may be divided into the class of persons and the class of things. Both may be the object of rights. In framing our language, therefore, we may say that all rights are the rights *of* persons; but they may be rights *to* either persons or things.

Rights mean legalized powers.

All that men desire, either with persons or things, is to render them subservient to the end for which they are desired as means. They are so rendered by certain powers over them. All rights, then, when the term is closely investigated, are found to mean powers; powers with respect to persons, and powers with respect to things. What any one means when he says that a thing is his property, is, that he has the power of using it in a certain way.

It is no part of the present inquiry to ascertain what rights *ought* to be constituted, or what rights perfect benevolence would choose to see constituted. That belongs to the question, how government should be constituted; in other words, how the powers which are necessary for the general protection ought to be distributed, and the advantages of the union to be shared. At present, our sole endeavour is to ascertain the most effectual means which the governing power of the state can employ for protecting the rights, whatever they are, which it has seen meet to create.

Every right imports a corresponding obligation.

Rights, it must be remembered, always import obligations. This is a point of view which, in the consideration of rights, has not in general attracted sufficient attention. If one man obtains a right to the services of another man, an obligation is, at the same time, laid upon this other to render those services. If a right is conferred upon one man to use and dispose of a horse, an obligation is laid upon other men to abstain from using him. It thus appears that it is wholly impossible to create a right without at the same time creating an obligation.

No creation of good by rights without the creation of evil.

The consequences of this law of nature are in the highest degree important. Every right is a benefit; a command to a certain extent over the objects of desire. Every obligation is a burden; an interdiction from the objects of desire. The one is in itself a good, the other is in itself an evil. It would be desirable to increase the good as much as possible. But, by increasing the good, it necessarily happens that we increase the evil. And if there be a certain point at which the evil begins to increase faster than the good, beyond that point all creation of rights is hostile to human welfare.

The end in view is a command over the objects of desire. If no rights are established, there is a general scramble, and every man seizes what he can. A man gets so much, and he is interdicted by the scramble from all the rest. If rights are established, he also gets so much, and is interdicted by his obligations from the rest. If what he obtains by his rights exceeds what he would have obtained by the scramble, he is a gainer by the obligations which he sustains.

---

[1] See the writings of Kant and his followers, *passim*. See also Degerando, and others of his school, in various parts of their works.

If it is proposed to create rights in favour of all the members of a community, the limits are strict. You cannot give all your advantages to every one; you must share them out. If you do not give equal rights to all, you can only give more than an equal share to some, by diminishing the share of others, of whom, while you diminish the rights, you increase the obligations. This is the course which bad governments pursue; they increase the rights of the few, and diminish the rights of the many, till, in the case of governments virtually despotic, it is all right on the one side, all obligation on the other.

It may be necessary to say a word to prevent misconstruction of the term "equal rights." Rights may truly be considered as equal, when all the sorts of obligation under which a man lies with respect to other men, they are placed under with respect to him; if all the abstinence which he is obliged to practise with respect to their property, they are obliged to practise with respect to his; if all the rules by which he is bound not to interfere with their actions, bind them equally not to interfere with his. It is evident, that inequality of fortune is not excluded by equality of rights. It is also evident, that from equality of rights must always be excepted those who are intrusted with the powers of the community for the purposes of government. They have peculiar rights, and the rest of the community are under corresponding obligations. It is equally evident that those must be excepted who are not *sui juris*, as children in non-age, who must be under the guidance of others. Of two such classes of persons, the relation to one another, that is, their reciprocal rights and obligations, need to be regulated by particular rules.

It is presumed that these illustrations will suffice to fix, in the minds of our readers, the exact meaning which is intended, in the present discourse, to be attached to the word *rights*. The sequel is to be occupied in discovering the means which are most proper to be employed for affording *protection* to those rights.

Meaning of the word protection, in the jurisprudential phrase, protection of rights.

II.—In the term protection, it is hardly necessary to give notice, that we do not here include protection against foreign enemies; that protection which is to be yielded by employing armies against invaders. The protection of which it is the business of jurisprudence to find out and to describe the means, is that which is required by one member of the community against the other members. The members of the community, each of whom endeavours to have as much as possible of the objects of desire, will be disposed to take those objects one from another; to take them either by force or by fraud. The means of preservation must therefore be found. Certain members of the community, as organs of government, are furnished with powers for that purpose. The question is, what powers are required, and in what manner are they to be employed?

In proceeding to present what may be called a skeleton map of the ill-explored country of jurisprudence, it is necessary to warn the reader, that he must supply, by his own attention, what the limits of the work did not permit to be done for him. The several topics are rather indicated than expounded. It is hoped they are indicated so clearly that there will be no difficulty in spreading out the ideas in detail. It is necessary, however, that the reader should do this for himself. As the writer has not been able to dwell upon the several topics, though of the utmost importance, long enough to stamp the due impression of them upon the mind, unless the reader takes time to do this, by reflection on each topic, as it arrives, he will pass to the succeeding ones without due preparation, and the whole will be perused without interest and without profit.

The first requisite to the protection of rights.

That a man's rights may be effectually secured, it is obviously necessary, in the first place, that they should be made capable of being accurately known. This seems to be so undeniable, that it would answer little purpose to enlarge in its illustration. It is, however, exceedingly necessary that the importance of this requisite should be clearly and adequately conceived. How can a man's rights be protected from encroachment, if what are his rights be uncertain or unknown? If the boundary by which his rights are distinguished is clear and conspicuous, it is itself a protection. It warns off invaders; it serves to strike them with awe; for it directs the eyes and indignation of mankind immediately and certainly to the offender. Where the boundary, on the other hand, is obscure and uncertain, so far scope is allowed for encroachment and invasion. When the question, to which of two men an article of property belongs, comes for decision to the judge, it is easy, if accurate marks are affixed, to point out and determine the rights of each. If no marks are attached, or such only as are obscure and variable, the decision must be arbitrary and uncertain. To that extent the benefit derived from the creation and existence of rights is diminished.

Definition of rights the first instrument of protection.

It is therefore demonstrable, and we may say demonstrated (the demonstration not being difficult), that in the inquiry respecting the means of protecting rights, the *definition of rights* may be entered at the head of the list. Without this as the groundwork, all other means are ineffectual. In proportion as rights can be ascertained, are the judicial functions and judicial apparatus capable of being employed to any beneficial purpose. In proportion to the facility with which they can be ascertained, is the extent of the benefit which the judicial functions are enabled to secure.

Such, then, is the first of the means necessary for the protection of rights. That they may receive the most perfect possible protection, they must be as accurately as possible defined.

Definition of the acts by which rights are violated, &c. another instrument of protection.

In supposing that rights have need of protection, we suppose that there are acts by which rights are violated. With regard to those acts, the object is twofold; to redress the evil of the act when it has taken place, and to prevent the performance of such acts in future. To prevent the performance, two classes of means present themselves; to watch till the act is about to be committed, and then to interpose; or to create motives which shall prevent the will to commit. It is but a small number of cases in which the first can be done; the latter is, therefore, the grand desideratum. From the view of these circumstances, we discover two other articles in the catalogue of means. Those acts by which rights are violated require to be made accurately known; in other words, to be defined; and the motives which are fitted to prevent them must be duly applied. Motives sufficient to that end can only be found in the painful class; and the act by which they are applied is denominated punishment. The definition, therefore, of offences, or of the acts by which rights are violated, and which it is expedient to punish, and the definition of the penalties by which they are prevented, are equally necessary with the definition of rights themselves. The reasons which demonstrate this necessity are so nearly the same with those which demonstrate the necessity of the definition of rights, that we deem it superfluous to repeat them.

Civil and penal code—what.

The definition of rights constitutes that part of law which has been generally denominated the *civil code*. The definition of offences and punishments constitutes that other part of law which has been generally denominated the criminal or *penal code*.

Code of procedure—what.

When rights are distributed, and the acts by which they may be violated are forbidden, an agency is required, by which that distribution may be maintained, and the violators of it punished. That agency is denominated judicature. The powers by which this agency is constituted require to be accurately defined, and the mode in which the agency itself is to be carried on must be fixed and pointed out by clear and determinate rules. These rules and definitions prescribe the form and practice of the courts, or mode in which the judicial functions are performed; and constitute that branch of law which has been called the *code of procedure.*

us Ju- r Body aw,—

These three codes, the civil code, the penal code, and code of procedure, form together the whole subject of jurisprudence. Of the three, it sufficiently appears that the last exists only for the sake of the other two. Courts and their operations are provided, that the provisions of the civil and penal codes may not be without their effect. It is to be considered, therefore, as subordinate, and merely instrumental, in respect to the other two. They form the main body of the law; this is an accessary to the main body, though an accessary of indispensable use. It would be of great advantage to affix characteristic names to distinguish from one another the main and accessary parts of law. Unexceptionable names, however, it is not easy to find. Mr Bentham, the great improver of this branch of knowledge, has called the civil and penal codes together by the name of "substantive law," the code of procedure by that of "adjective law;" not, we may be satisfied, because he approved of those names, but because the language hardly afforded others to which equal objections would not apply. In the very sense in which either the term accessary or the term adjective can be applied to the code of procedure, both may be applied to the penal code, as it respects the civil. The penal code exists purely for the sake of the civil, that the rights which are ordained by the legislature, and marked out by the terms of the code, may be saved from infringement. The civil code is therefore the end and object of all the rest. The code of procedure, however, is auxiliary to each of the other two; the penal code to no more than one.

Having now explained the nature of the three codes which constitute the body of law necessary for the protection of rights, it remains that we illustrate, as much in detail as our limits will permit, what is required for the perfection of each.

isre- d for erfec- of the code.

III.—The grand object of the civil code is the definition of rights. Rights are sometimes more, sometimes less extensive. Thus the right of a man to a horse may solely extend to use him in riding from one stage to another; or it may extend to the power of doing with him as he pleases. In like manner, the rights of a man with respect to a person may extend only to some momentary service, or they may go the length of slavery. Even slavery itself does not imply rights always equally extensive. In some cases it implies rights as extensive over the slave as over the inferior animals.

All rights, when the essence of them is spoken of, are powers; powers to an individual which the governing members of the community guarantee; powers, more or less extensive, of making either a person or a thing subservient to the gratification of his desires. To be made to gratify the desire of an individual, is to be made to render him a *service.* And the term *service* may, fortunately, be applied to both persons and things. A man receives a service from the field when it produces a crop, as well as from the servant and the horse who ploughed it. In one meaning of the word service, it implies only active service, or that rendered by the voluntary operations of sentient beings. In the present case, however, it is employed to denote both active and passive services. It is evident, that in every case in which any thing inanimate is rendered subservient to the gratification of a desire, the service is, properly speaking, a passive service. It is also evident, that even animate beings are rendered subservient to the gratification of desires in a way which may equally be called passive.

It is necessary to request attention to the explanation which is here given of the meaning in which the term *service* is to be employed; as both the English and the Roman lawyers use it in a very restricted sense. Here it is employed to denote the whole of that ministration to the gratification of our desires, which we are entitled, in consequence of rights, to derive either from persons or from things. Rights are powers, and the powers are means for the obtaining of services. We have now, therefore, a language, by the help of which we may speak with tolerable clearness.

Our object is to define rights, and rights are powers. But these powers can be defined, only by a reference to the services which they are the means of obtaining.

Operations preliminary to the definition of rights.

The first thing, therefore, to be done for the definition of rights is, to make out a list of all the kinds of services which the legislature permits an individual to derive, first, from persons, and secondly, from things. This would not be a matter of very great difficulty. It would be right to begin with the most simple cases, and go on to the more complex. Thus, of the services derivable from a person, some are limited to a single species of act, and that within a limited time, and at a particular place. Others are services, consisting of various acts, limited or not limited in space and time. And, lastly, are the whole services which a man is capable of rendering, without limitation as to either space or time. Considerable pains would be necessary to make the list complete; and not only considerable pains, but considerable logic, would be necessary to classify the services, in other words, make them up into lots, the most convenient for the purpose in question, and to fix the extent of each by an exact definition. It is obvious, that as soon as all the possible gradations in the services which one human being can render to another, are exhibited by such enumeration and assortment, it is easy for the legislature to point out exactly whatever portion of these services it is its will to give any individual a right to.

The same considerations apply to the class of things. In being made subservient to the gratification of our desires, they also render services. In proportion as a man has the right to derive those services from them, they are said to be his property. The whole of the services which are capable of being derived from them may, without much difficulty, be enumerated and classified; and when they are so, those which it may be the pleasure of the legislature to make any one's property may be very easily and distinctly pointed out.

We may take land for an example. All the different services which are capable of being derived from the land may be enumerated, and, being classed under convenient heads, may be referred to with perfect certainty; and any portion of them which is made the property of any individual may thus be accurately described. A man may have a right simply to pasture a field; to pasture it for a day, or a year, or a hundred years. He may have a right to crop it; and that either in a particular manner, or in any manner he pleases, for a year, or for any other time. He may have a right to use it for any purpose, and that during a limited time, or an unlimited time. The services which it is capable of rendering may belong to him in common with a number of other persons, or they may all belong to himself.

In illustration of this subject we may notice a classification of the services derivable from the land, made, though very rudely, by the English law. Blackstone, who, like other English lawyers, has on this, as on all other occasions, no idea of any other classification than that which is made by the technical terms of the English law, has distinguished certain lots of the services derivable from the land, under the name of "estates therein; estates with respect to, 1*st*, quantity of interest; 2*dly*, time of enjoyment; 3*dly*, number and connection of the tenants." That is, estates in fee simple, comprehending the whole of the services which are capable of being derived from the land, unlimited in point of time; estates in fee tail, implying always limitation in point of time, and often a limitation in respect to some of the services; estates for years; estates at will; estates at sufferance; estates on condition; estates in remainder; estates in reversion; estates in jointenancy; estates in coparcenary; estates in common. The Roman law has made no enumeration or classification of the services derivable from any thing, not even from the land. It speaks of property in the abstract, and in two states; property in possession, and property in action. The English law does the same thing in regard to all other property but the land. "Property, in chattels personal, is either in possession or in action," says Blackstone. He does, indeed, add, "the property of chattels personal is liable to remainders, if created by will, to jointenancy, and to tenancy in common."

The services derivable from other articles of property than land, need not be divided under many heads. A piece of plate, for example, may render certain services without alteration of its form; it may be incapable of rendering other services till it has received an alteration of its form. It is chiefly, therefore, by limitation of time, that the various quantities of interest in such articles need to be determined. A man's right may extend to the use of a silver cup, for a day, or a year, or for his life. During this time the different services which it is capable of rendering have no occasion to be divided. They go naturally altogether. An unlimited right to its services implies the power of using it, either with or without alteration of its form, and without limitation of time. In most instances the limited right would be called loan, though, in the case of heir-looms and some others, there is a limited use to which the term loan is not customarily applied.

In speaking of the rights which a man may have to persons; as master, as father, as husband, and so on, there is one case so remarkable, that it requires a few words to be added in its explanation. It is that of one's own person. In this case the rights of the individual have no proper limitation beyond the obligations under which he is laid, in consequence either of the rights conferred upon others, or of the means which are thought necessary for protecting them.

If we have enabled our readers to form a tolerable conception of what we desire to be accomplished, under the title of an enumeration and commodious classification of the services derivable from persons and things, we have performed what we proposed. The enumeration and classification themselves are evidently incommensurate with the design of an article in the present work. That they are practicable may be confidently taken for granted. In fact, they amount to nothing more than a description of the different degrees in which the property of a thing may be possessed; a point which is decided upon in every legal dispute. If this be done from time to time, for one article after another, it may be done once for all.

We have already said, that rights are powers, powers for the obtaining of certain services. We have also said, that those powers can be defined only by a reference to the services which they are the means of obtaining. When those services are enumerated and classified, what remains is easy. A right to those services must begin, and it may end. The legislature has only to determine what fact shall be considered as giving a beginning to each right, and what shall be considered as putting an end to it, and then the whole business is accomplished.

Two things necessary for the definition of a right.

It is evident that, for the definition of rights, two things are necessary. The first is, an exact description of the extent of the right; the second is, the description of the fact which gives birth to it. The extent of the right is described by reference to the lots of services, in the title to which services all rights consist. The facts which the convenient enjoyment of rights has pointed out as the fittest for giving commencement to rights, have been pretty well ascertained from the earliest period of society; and there has, in fact, been a very great conformity with respect to them in the laws of all nations.

The following is an imperfect enumeration of them: *An expression of the will of the legislature,* when it makes any disposition with regard to property; *occupancy,* when a man takes what belongs to nobody; *labour; donation; contract; succession.* Of these six causes of the commencement of a right, there is a remarkable distinction between the first three and the last three. The first three give commencement to a right in favour of one individual, without necessarily putting an end to a right enjoyed by any other individual. The last three give commencement to a right in favour of one individual, only by making the same right to cease in favour of another individual. When a man, by donation, gives a horse to another man, the horse ceases to be the property of the one man, by the very same act by which he becomes the property of the other; so in the case of sale, or any other contract.

It is necessary for the legislature, in order that each man may know what are the objects of desire which he may enjoy, to fix, not only what are the facts which shall give commencement to a right, but what are the facts which shall put an end to it. In respect to these facts, also, there is a great harmony in the laws of all nations.

There is first the will of the legislature. When it confers a right, it may confer it either for a limited or for an unlimited time. In the term unlimited time, we include the power of tradition, or transfer, in all its shapes. If the time is limited, by the declaration of the legislature, either to a certain number of years, or the life of the party, the fact which terminates the right is obvious. If a man possesses a right unlimited in point of time, the events are three by which it has been commonly fixed that it may be terminated: 1. some expression of his own will, in the way of gift or contract; 2. some act of delinquency; or, 3. his death.

The possessor of a right unlimited in point of time, may, in the way of gift or contract, transfer his right either for a limited or for an unlimited time. Thus the owner of a piece of land may lease it for a term of years. He may also, in this way, convey the whole of the services which it is capable of rendering, or only a part of them. In this transaction, one event gives birth to a right in favour of the man who receives the lease, and terminates a right which was possessed by the man who gives it; another event, namely, the arrival of the period assigned for the termination of the lease, terminates the right of the man who had received the lease, and revives the former right of the man who gave it.

Acts of delinquency have been made to terminate rights, by the laws of most nations, in the various modes of forfeiture and pecuniary penalty.

The mode in which the event of death should terminate rights has been variously regulated. Sometimes it has been allowed to terminate them simply; and what a man left at his death was open to the first occupant. All but rude nations, however, have determined the persons to whom the rights which a man possessed without limitation of time, shall pass at his death. The will of the former owner, when expressed, is commonly allowed to settle the matter. When that is not expressed, it has by most legislators been regulated that his rights shall pass to his next of kin.

What is the extent of each right, by what event it shall receive its commencement, and by what event it shall be terminated; this is all which is necessary to be predetermined with respect to it. To do this is the duty of the legislature. When this is done, the inquiry of the judge is clear and simple. Does such a right belong to such a man? This question always resolves itself into two others. Did any of the events which give commencement to a right happen in this case? And did any of those events which terminate a right not happen in this case? These are questions of fact as distinguished from law, and are to be determined by the production of evidence. If a man proves that an event which gives commencement to a right happened in his case, and if another man cannot prove that an event which terminates a right happened subsequently in that case, the right of the first man is established.

If we have now ascertained the importance and practicability of a civil code, and have shown what is to be done in order to obtain the benefit of it, we shall conclude, with some confidence, that we have rendered a great service to mankind. We proceed to the consideration of the penal code. The object of that code is, the acts by which rights may be violated.

at is
essary
the per-
ion of
penal
e.

IV.—In the term violation, we include all those acts by which the powers conveyed by a right are prevented from operating according to the will of the owner.

With respect to a part of such acts, all that it is found convenient to do, through the instrumentality of judicature, is, to remove the obstruction which prevents the enjoyment of the right, without inflicting any penalty for creating it. Thus, if a debt is not paid when due, the right is violated of the man who ought to receive it. Enough, however, is in this case supposed to be done, if the man who owes the debt is constrained to make payment. The act of secretly abstracting, with a view to appropriate a property of perhaps less value, would be an act which the laws of all nations would punish as theft.

Of injurious acts, those alone to the commission of which it has been deemed expedient that penalties should be annexed, are considered as the object of the penal code. Of injurious acts so perfect an analysis has been exhibited by Mr Bentham; so perfectly, too, have the grounds been laid down upon which those acts which are destined for punishment should be selected from the rest; and so accurately have the principles according to which punishment should be meted out been displayed by that great philosopher, that, on this part of the subject, the philosophy of law is not far from complete.

s meet
punish-
t.

As acts are declared to be offences, and are made subject to punishment solely for the protection of rights, it is evident that all acts which enter into the penal code are acts which infringe rights, either directly or indirectly. Those which infringe them *directly*, are those by which injury is done to some individual or individuals; a blow, for example, an act of theft, and so on. We include also, under this division, all acts the *effects* of which produce an immediate infringement of rights; destroying a mound, for example, to inundate the lands of another man; importation of infection, by which the health or lives of others may be destroyed. Those acts by means of which rights are affected *indirectly*, are those which bear immediately upon the means which the state has provided for the protection of rights. The means which the state has provided for the protection of rights are the operations of government generally. All acts, therefore, meet for punishment, are acts which disturb either individuals in the enjoyment of their rights, or the operations required for the protection of those rights. The latter, though mediately, and not immediately, hurtful, are apt to be more extensively mischievous than the former. An act which infringes upon a right immediately, is commonly injurious only to one individual, or a small number of individuals; an act which prevents any of the operations of government from proceeding in its natural course, is injurious to all those individuals to whose protection the due course of that operation is useful. Permit acts which interrupt all the operations of government, and all rights are practically destroyed.

If, as it thus appears, acts are meet for punishment, only because they infringe a right, or because they interrupt the operations provided for the protection of rights, it is evident, that, in the definition of one set of those acts, must be included the specification of the right which is infringed; and, in the definition of the other, must be included the specification of the operation disturbed. Before, therefore, an accurate penal code can exist, there must exist an accurate civil code, and also what we may call a constitutional or political code; the latter consisting of an accurate definition of the powers created for the purposes of government, and of the limitations applied to their exercise.

What is required to the definition of an offence.

From what has been said, it may appear that the definition of offences, by which name we shall hereafter distinguish punishable acts, consists necessarily of two parts. The first part is the specification of the right infringed, or the operation of government disturbed; and the second part is the definition of the mode. Thus, for the definition of an act of theft, the right which the act has violated must be distinctly marked, and also the mode in which the violation has been committed. In one and the same class of offences, those against property, for example, the mode in which the violation is performed, is that chiefly which constitutes the difference between one offence and another. In a theft and a robbery, the right violated may be exactly the same; the mode in which the violation was effected constitutes the difference.

For several purposes of the penal code, it is useful, that, in the specification of the right violated, the value of what has been violated, in other words, the amount of the evil sustained, should sometimes be included. It is evident that the value of rights can be judged of ultimately, only by a reference to human feelings. Of these feelings, however, certain outward marks must be taken as the standard. In offences which concern property, the modes of valuation are familiarly known. In injuries to the person, those marks which denote injuries regarded by mankind in general as differing in magnitude; the size, for example, or position, of a wound; in injuries to reputation, the words used, and the occasion when, and so forth, are the only means of distinction which can be employed.

It may be necessary also to remark, that, in that part of the definition which relates to the mode, are to be distinguished the parties, when more than one, who engage in the same offence with different degrees of criminality; meaning, by different degrees of criminality, nothing more than demand for different degrees of punishment. The chief classes of such persons are those of principals and accessaries; and of accessaries, both those before and those after the fact.

In the definition of the mode, the act is first to be described in its ordinary shape. The act, however, may be attended with aggravating circumstances on the one hand, or extenuating circumstances on the other; presenting a demand for increased punishment in the first case, and diminished punishment in the second. Mr Bentham has logically remarked, that the circumstances which are to be regarded as aggravating, and the circumstances which are to be regarded as extenuating, being pretty nearly the same in all cases, they may be defined, in a separate chapter, once for all. This being done, the code proceeds in the following manner:—The definition is given of the offence in its ordinary shape, and the appropriate punishment is annexed; then immediately follows the same offence with aggravating circumstances; punishment so much the more severe: the same offence with extenuating circumstances; punishment so much the less.

Thus far we have spoken of the definition of offences, into which we have entered the less in detail, because we do not think there is much of controversy on the subject. Many persons, who doubt the possibility of framing a civil code, though, after the preceding exposition of the subject, it is a doubt which could not, we should imagine, very easily maintain itself, allow that offences may all be defined; and that it is possible to prevent the monstrous iniquity of punishing men for acts, as offences, which they have not the means of knowing to be such.

The doctrine of punishment.

V.—After offences, comes the consideration of the punishment to be annexed to them. This is a subject of considerable detail; it has been, however, so fully and admirably treated by Mr Bentham, that only some of the more general considerations, necessary to mark out the place and importance of the topic, need here to be introduced.

When a right has been infringed, there are two things, it is evident, which ought to be done: the injury which has been sustained by the individual ought to be repaired, and means ought to be taken to prevent the occurrence of a like evil in future.

Satisfaction.

The doctrine of satisfaction is not at all difficult, as far as regards the regulating principles; the complication is all in the detail. The greater number of injuries are those which concern property. A pecuniary value can generally be set upon injuries of this sort, though it is not very easy to determine the *pretium affectionis*, a matter of considerable importance, which the English law, so much made up of clumsiness in one part, and false refinement in another, wholly overlooks. For injuries to the person, also, it is most frequently in the pecuniary shape alone that any compensation can be made. In making these estimates, some general marks are all that can be conveniently defined by the law, and a considerable discretion must be left to the judge. Indeed, the question of damages is always a question of fact, which must be determined by the evidence adduced in each instance.

It accords with the feelings of every man to say, that he who has committed an injury should be made to repair it. One part of punishment, therefore, ought, wherever special reason does not intervene, to consist in making satisfaction to the party injured. Pecuniary satisfaction, where the delinquent is rich, may be a small part of the due punishment; still, however, there is an obvious propriety in making it a part so far as it can go. In the cases in which the delinquent has no property, there is the same propriety in making his labour subservient to that end. Hard labour, with the most economical fare, till the produce of the labour equals the amount of the satisfaction required, is therefore a species of punishment recommended by the strongest considerations. It is not said that labour so limited would always be sufficient punishment, and there are many cases in which it would be too much; but even then it should go as far as it can in the one case, and as far as it ought in the other.

When the injury is done to reputation, there is a manifest propriety in making the injurer contribute to the reparation, wherever it can be done. In many of the cases, too, the proper mode is abundantly obvious; all those, for example, where the publication of falsehood is the injurious act. The author of the injury may be obliged to declare, in a way as public as that of the offence, and as well calculated as possible for the reparation of the injury, that he has been solemnly adjudged to have propagated a falsehood, and is condemned to publish his own shame.

In the case of those offences which affect rights indirectly, namely, by affecting the securities provided for them, satisfaction seldom can have any place, because no determinate individual or individuals have sustained an injury.

This may suffice in exposition of the first thing which is desirable where an injury has been committed; namely, that reparation should be made. The second is, that measures should be adopted for preventing the future occurrence of similar events.

Penalties.

Acts are performed only because there are motives to the performance of them. Of course injurious acts are performed only because there are motives to the performance of them.

Corporal restraint being out of the question where all the members of the community are concerned, it is evident that only two means remain for preventing injurious acts; either, first, to take away the motives which provoke to them; or, secondly, to apply motives sufficient for the prevention of them.

From the very nature of many of the acts, it is impossible to take away the motives which provoke to them. From property stolen it is impossible to detach the value of the property; from vengeance it is impossible to detach the hope of that relief which is sought by the blow that is aimed.

What is wanted, then, is a sufficiency of motive in each instance to counteract the motives which lead to the crime. Whatever the motives of the alluring kind which lead to an act, if you give stronger motives of the same kind to abstain from the act, the act will of course be prevented. The man who would steal from you L.5, will assuredly not do so if he knows that he shall receive L.6 for abstaining.

The question may then be started, Why should not all crimes be prevented in this way, since reward is much more desirable and humane than punishment? The answer is most satisfactory, and is built upon a ground which ought to receive profound attention on many occasions on which it is treated with the most perfect disregard. No reward can be given to one man or set of men, but at the expense of some man or set of men. What is reward to one, is therefore punishment to others. If L.6 be given to the man who would steal L.5, it must be taken from some one or more individuals of the community. If one man is elevated by any title or distinction, all the rest, with regard to him, are degraded and depressed. This is utterly unavoidable. The one event is necessarily included in the other. The giving of rewards, therefore, is a matter of serious import. It is not that simple act, that pure creation of good, which it is often so fraudulently given out to be, and so credulously and foolishly admitted to be.

Other reasons, which prove the insufficiency of rewards for preventing injurious acts, are too obvious to require to be mentioned. We shall not therefore dwell upon this topic. This at least is sufficiently evident, that, to counteract the motives which lead to the commission of an act, we have but two methods. If we cannot apply motives of the pleasurable sort to induce the party to abstain from committing the act, we must apply such motives of the painful sort as will outweigh the motives which prompt to the performance. To prevent, by such means, a theft of L.5, it is absolutely necessary to affix to that act a degree of punishment which shall outweigh the advantage of possessing L.5.

We have now, it is evident, obtained the principle by which punishment ought to be regulated. We desire to prevent certain acts. That is our end, and the whole of our end. We shall assuredly prevent any acts, if we attach to them motives of the painful kind, sufficient to outweigh the motives of the opposite kind which lead to the performance. If we apply a less quantity of evil than is sufficient for outweighing those motives, the act will still be performed, and the evil will be inflicted to no purpose; it will be so much suffering in waste. If we apply a greater quantity of evil than is necessary, we incur a similar inconvenience; we create a quantity of evil which is absolutely useless; the act which it is the tendency of the motives of the pleasurable kind to produce, will be prevented, if the motives of the painful kind outweigh them in the smallest degree, as certainly as if it outweigh them to any degree whatsoever. As soon, therefore, as the legislator has reached that point, he ought immediately to stop. Every atom of punishment which goes beyond, is so much uncompensated evil, so much human misery created without any corresponding good. It is pure unmingled mischief.

As no exact measure, indeed, can be taken of the quantity of pain which will outweigh a supposed quantity of pleasure, it is sometimes necessary to risk going somewhat beyond the mark, in order to make sure of not falling short of it. And, in the case of acts of which the evil is very great, of the higher order of crimes, in short, it may be expedient to risk a considerable degree of excess in order to make sure of reaching the point of efficiency.

In estimating the quantity of evil which it may be necessary to create, in order to compensate the motive which leads to a mischievous act, two circumstances should be taken into the account. These are certainty and proximity. It is of the less importance here to enter far into the illustration of these topics, that they are now pretty generally understood. It is well known that the prospect of an evil which is to happen within an hour, or two hours, produces a much greater uneasiness than the prospect of the very same evil removed to the distance of years. Every man knows that he will die within a certain number of years; many are aware that they cannot live beyond a few years; and this knowledge produces no uneasiness. The effort, on the other hand, which enables a man to behave with tranquillity on the prospect of immediate death, is supposed to be so difficult, that it is this which makes the hero. It is therefore of the greatest importance that punishment should be immediate; because, in that case, a much smaller quantity of evil suffices. It is imperatively required by the laws of benevolence, that, if evil is a necessary means to our end, every expedient should be used to reduce it to the smallest quantity possible. It is cruelty, it belongs only to a malignant nature, to apply evil in a way which demands a quantity of it greater than would otherwise have been required. Suppose a law, that no act of theft should be punished or challenged till twenty years after the commission, or till the life of the thief was supposed to be near its end. It is evident that all punishment in this case, that death, in the greatest torture, would be nearly destitute of power. This is partly the ground of the complaint, of the little efficacy of religious punishment, though dreadful beyond expression in the degree.

The want of certainty is a defect of equal importance. If it is a matter of doubt whether a threatened evil will take place, the imagination is prone to magnify the chance of its not happening; and, by indulgence, magnifies it to such a degree, that the opposite chance at last excites a comparatively feeble influence. This is a remarkable law of human nature, from the influence of which even the most wise and prudent of men are not exempt; and of which the influence is predominant in those inconsiderate minds which are the most apt to give way to the allurements of vice. To illustrate this law, the influence of the religious punishments affords the most instructive of all examples. The punishments themselves go far beyond what the imagination can conceive. It is the complaint of divines, and the observation of all the world, that, with the great body of men, the efficacy of them is exceedingly small. The reason is, that to the want of proximity is added the greatest uncertainty. If a man puts his fingers in the candle, he knows that he will be punished, and immediately, by being burned. If a man commits even a heinous sin, he has no fear of receiving the religious punishment immediately, and he conceives that, in the mercy of his Judge, in repentance and faith, he has a chance of escaping it altogether. This chance his imagination exaggerates, and most men can, in this way, go on sinning with tranquillity, to the end of their days. If all punishments were as certain and immediate as that of putting a finger in the candle, the smallest quantity, it is evident, beyond what would form a counterbalance to the advantage of the forbidden act, would suffice for its prevention. If uncertainty is admitted to any considerable degree, no quantity of evil will suffice. It is a fact which experience has most fully established, and which is now recognised in the most vulgar legislation, that undue severity of punishment runs counter to its end. This it does by increasing uncertainty; because men are indisposed to be the instruments of inflicting evil by which their feelings are lacerated. That legislation, therefore, is bad which does not take measures for the greatest possible degree of proximity and certainty in the punishments which it applies.

The sources are three from which motives of the painful sort, applicable to the purposes of the legislator, are capable of being drawn:—*1st*, The physical; *2dly*, the moral; and, *3dly*, the religious.

I. Pains from the physical source may be communicated to a man through,

1. His person,
2. His connections,
3. His property.

Through his person, they may be communicated in four principal ways,—by death, disablement, restraint and constraint, simple pain.

A man's connections are either public or private; private, as spouse, parent, servant, master, &c.; public, as ruler, subject, teacher, scholar, and so on.

The modes in which a man is punished through his property need no explanation.

II. Pains from the moral source are the pains which are derived from the unfavourable sentiments of mankind. For the strength of the pains derived from this source, we must refer to the writers who have treated of this part of human nature. It is sufficient here to advert to what is universally recognised, that these pains are capable of rising to a height, with which hardly any other pains, incident to our nature, can be compared; that there is a certain degree of unfavourableness in the sentiments of his fellow-creatures, under which hardly any man not below the standard of humanity can endure to live.

The importance of this powerful agency for the prevention of injurious acts is too obvious to need to be illustrated. If sufficiently at command, it would almost supersede the use of other means. It is, therefore, one of the first objects to the legislator to know in what manner he can employ the pains of the popular sanction with the greatest possible effect.

To know how to direct the unfavourable sentiments of mankind, it is necessary to know in as complete, that is, in as comprehensive a way as possible, what it is that gives them birth. Without entering into the metaphysics of the question, it is a sufficient practical answer, for the present purpose, to say, that the unfavourable sentiments of men are excited by everything which hurts them. They love that which gives them pleasure; hate that which gives them pain. Those acts of other men which give them pleasure or save them from pain, acts of beneficence, acts of veracity, and so on, they love. Acts, on the other hand, which give them pain, mendacity, and so on, they hate. These sentiments, when the state of mind is contemplated out of which the acts are supposed to arise, are transformed into approbation and disapprobation, in all their stages and degrees; up to that of the highest veneration, down to that of the deepest abhorrence and contempt.

The unfavourable sentiments which the legislator would excite towards forbidden acts must, therefore, in each man, arise from his conception of the mischievousness of those acts. That conception depends upon three circumstances: *1st*, The view which he himself takes of the act; *2dly*, the view which appears to be taken by other people; *3dly*, every thing which operates to render more or less permanently present to his mind his own and other men's conception of its mischievousness. From these circumstances, the practical rules for applying this great power as an instrument of the legislator for the prevention of mischievous acts are easily deduced. 1. Let the best measures be taken for giving the people a correct view of the mischievousness of the act; and then their unfavourable sentiments will be duly excited. 2. Let proper pains be taken that the people shall know every mischievous act that is committed, and know its author; that so no evil act may, by concealment, escape the punishment which their unfavourable sentiments imply. 3. Let the legislature, as the leading section of the public, make publication of its own unfavourable sentiments; let it brand the act with infamy. 4. Let the same publication of his own unfavourable sentiments be made by the judge in the shape of reprimand and other declarations. 5. The legislature may increase the effect of these declarations, where the case requires it, by symbolical marks; or, 6. by personal exposure. 7. The legislature may so order matters in certain cases, that the mischievous act can be done only through another act already infamous; as when it is more infamous to break a vow to God than to make false declarations to men, a witness may be made to swear that he will tell the truth. 8. As the favourable sentiments of mankind are powerfully excited towards wealth, a man suffers through the popular sanction when his property is so diminished as to lessen his rank.

III. In pointing and proportioning the apprehension of divine punishment, the legislator can do three things:

1. He can declare his own apprehension, and the measure of it, which should be as exactly proportioned as possible to the mischievousness of the acts:

2. He can hire other people to declare similar apprehensions, and to make the most of the means which are available for their propagation:

3. He may discountenance the pointing of religious apprehensions to any acts which are not mischievous; or the pointing of them more strongly to acts which are slightly, than to acts which are deeply mischievous. Whatever power of restraining from mischievous acts may be lodged in religious apprehensions, is commonly misapplied and wasted. It would be worth the cost, therefore, of pretty forcible means to prevent such a misapplication and waste of religious fears.[1]

In drawing from one or more of these sources, a lot of punishment adapted to each particular case, the following properties, desirable in a lot of punishment, ought to be steadily borne in view. Every lot of punishment ought, as much as possible, to be,

1. Susceptible of graduation, so as to be applied in different degrees.

2. Measurable, that the difference of degrees may be duly ascertained.

3. Equable, that is, calculated to operate with the same intensity upon all persons.

4. Such that the thought of the punishment may naturally excite the thought of the crime.

5. Such that the conception of it may be naturally vivid and intense.

6. Public, addressed to the senses.

7. Reformative.

8. Disabling; viz. from crime.

9. Remediable; viz. if afterwards found to be undeserved.

10. Compensative; viz. to the party injured.

11. Productive; viz. to the community, as labour.

Of all the instruments of punishment which have yet occurred to the ingenuity of man, there is none which unites these desirable qualities in anything like an equal degree with the *Panopticon Penitentiary*, as devised and described by Mr Bentham.

One general rule applies in the case of all the lots of punishment. It is this: That the private good which has operated as the motive to the injurious action should, in all possible cases, be cut off, and the expected enjoyment prevented. Where this can be done completely, all the additional punishment necessary is only that which would suffice to compensate the want of certainty and proximity in the act of deprivation; for no man would commit a crime which he was sure he could not profit by; no man would steal, if he knew that the property stolen would that minute be taken from him. The interests which are capable of being promoted by a criminal act may be summed up under the following titles:

1. Money, or money's worth.
2. Power.
3. Revenge.
4. Vanity, emulation.
5. Sensual pleasure, chiefly venereal.
6. Safety in respect to legal punishment.

With respect to four of these interests, viz. money, power, vanity, and safety in respect to legal punishment, the contemplated benefit is capable, in many cases, of being completely intercepted.

In the case in which revenge has operated through the degradation of the party suffering, the evil-doer may be disappointed by re-exaltation of the degraded party.

Sensual pleasure, having been enjoyed, is beyond the reach of this operation.

It is highly worthy of observation, that, among the advantages constituting the motives to crime, those which can be cut off, and from the enjoyment of which the offender can be precluded, constitute by far the most frequent incentives to crime.

[1] Nothing which can in any degree interfere with the rights of conscience, including whatever interpretation any man may put upon the words of Scripture, is here understood. It is the object of the legislator to encourage acts which are useful, prevent acts which are hurtful, to society. But religious hopes and fears are often applied, not to promote acts which are useful, prevent acts which are hurtful, to society; in which way alone they are capable of conducing to the views of the legislator; but to mere ceremonies. And cases are not wanting in which they are applied to produce acts that are hurtful, prevent those that are useful, to society. As far as religious motives are attached to the useful instead of the useless or hurtful objects, society is benefited. It is this benefit which it is recommended to the legislator to pursue.

This must suffice as a summary of what should be said on the mode of applying pain most usefully for the prevention of certain acts. It only remains to add, that the following are the cases in which it may be pronounced unfit that pain should be employed for that purpose:

1. Where the evil to the community does not overbalance the good to the individual.

2. Where the evil necessary for the punishment would outweigh the evil of the act.

3. Where the evil created is not calculated to prevent the act.

4. Where the end could be obtained by other means.

The code of procedure.

VII.—We have now, therefore, stated what the limits of this discourse enable us to adduce on the subject of the main body of the law; the enactments of the legislature with respect to rights, and with respect to those acts by which rights are violated. It remains that we consider that subsidiary branch of law, by which an agency is constituted for the purpose of carrying those enactments into effect. The inquiry here is, 1. what are the operations essential to that agency; 2. by what agents are they most likely to be well performed; and, 3. what are the best securities that can be taken for the good conduct of those agents.

It most significantly illustrates the manner in which ignorance gropes its way in the dark, to observe that the agency, the sole end of which is to carry into execution the civil and penal laws, was created first, and was in operation for ages, before the idea of the other branches of law was even tolerably framed. It is also worthy of remark, that the men whose wisdom rules our affairs, are in the habit of calling the mode in which ignorance gropes its way in the dark, by the name of experience; the mode of acting upon a plan, and with forethought, by the names of theory and speculation.

There is instruction in observing the mode in which this inverted course of law-making was pursued. Men disputed; and their disputes were attended with the most destructive consequences. Originally, the king, at the head of the military force, and his subordinates, each at the head of a section of that force, interfered in those disputes. After a time, the king appointed functionaries, under the name of judges, for that particular service. Those judges decided, without any rule, by their own discretion. The feelings of the community, grounded upon their experience of what tended to good and evil upon the whole, pointed vaguely to certain things as right, to other things as wrong; and to these the judge, as often as he was *bona fide*, conformed his decision. The mode was similar both in arbitrating and in punishing.

As punishing, especially in the severer cases, was an act which made a vivid impression upon the mind, the mode in which that act had been performed in previous cases was apt to be remembered; of the several modes, that which was most approved by the public would naturally be followed the most frequently, and at last there would be a species of scandal, if it was unnecessarily departed from. In this way a uniformity, more or less perfect, was established, in punishing the more heinous offences; and in regard to them custom first established what had some small portion of the attributes of a law.

In those cases in which, without a call for punishment, the authoritative termination of a dispute was all that was required, the experience of what was necessary, not only for any degree of mutual comfort, but even for the means of subsistence, soon established a few leading points of uniformity. Thus, when a man had cultivated a piece of ground which belonged to nobody more peculiarly than to himself, it was evidently necessary that the crop should be considered as belonging to him; otherwise, no crops would be raised, and the community would be deprived of the means of subsistence.

These general feelings, with the remembrance, more or less perfect, of what had been done in similar cases, were the only guide; and it is surprising to what an extent, over the surface of the whole globe, law has, in all ages, remained in that state of imperfect existence, if, indeed, with any propriety, it can be called a state of existence. In every part of Asia, and in all ages, law has remained in that state of existence or non-existence. In Europe, where, at a pretty early period, it became the practice to record in writing the proceedings of the judges, the natural propensity of referring to the past as a rule for the present begat in time a species of obligation of being directed by the examples which had already been set. This created a uniformity and certainty, which, however imperfect, afforded something better than the arbitrary proceedings of Asiatic judges. Yet this was a benefit which had a dreadful alloy. A body, not of law, but of decisions, out of which, on each particular occasion, a law for that particular occasion, as out of the crude ore, was to be smelted, hammered, and wire-drawn, was the natural material out of which to manufacture a system of chicane. How accurately the system of law, in the several nations of Europe, has conformed to the character of a system of chicane, is matter of present and lamentable experience. The uncertainty, the delay, the vexation and expense, and that immorality of the worst species with which they inundate the community, are not the only evils, great as they are, of laws constructed upon such a plan. A system of laws, so constructed, becomes an instrument of conservation for the barbarous customs and ideas of the times in which they were engendered; and infests society with the evils of an age which it has left behind.

To conceive the operations which are necessary to give effect to the enactments of the legislature, it is necessary to conceive the occasions which call for them.

When the legislature has established rights, so long as there is no dispute about those rights, and so long as there is no complaint of any violation of them, so long there is no occasion for any agency to give to the enactments of the legislature their effect. The moment, however, one person says, the right to that object is mine, and another person says no, but the right to that object is mine; or the moment any man complains that such or such a right belonging to him another man has violated, that moment occasion for the agency in question begins.

It is evident, also, that the operations necessary to give effect to the enactments of the legislature are confined to those two occasions, namely, that on which a right is disputed, and that on which it has been violated. On the occasions on which a right is disputed, it is requisite to determine to whom it belongs. On the occasions on which a right has been violated, it is sometimes only required to compel reparation to the injured party; sometimes it is necessary, besides, to inflict punishment upon the offender. The question is, What are the operations required for these several results?

Where a right is disputed, all possible cases may be resolved into that of A who affirms, and B who denies. That right is mine, says A; it is not yours, says B.

The first question to be asked of A is, which, among those facts which the legislature has determined shall give commencement to rights, happened in such a manner as to give commencement to that which is claimed as a right by him.

If no such fact is affirmed, the right does not exist. If some such fact is affirmed, it may be met by the opponent in one of two ways. B either may deny the fact, and affirm that the right never had a commencement; or he may allow the fact, and admit that the right had a commencement, but affirm that there had subsequently happened one of those facts which put an end to rights: admitting that A bought the horse, and had a right to him in the month of July, he might affirm that A sold him again in August, and by that transaction put an end to his right.

When B meets the affirmation of A in the first way, that is, by denying the commencement of the right, he may do it in either of two ways. He may deny the investitive fact which A affirms, or, not denying the fact, he may affirm some antecedent fact which deprived it of its investitive power. Thus, if A affirmed that he got the property by occupancy, B may affirm that it was not open to occupancy, but the property of another person. If A affirmed that he got the property by succession to his father, B may allow the fact of the succession, but affirm that the property did not belong to the father of A at the time of his death.

Whenever the legislature has accurately determined what are the facts which shall give commencement, and what those which shall give termination, to a right, the whole confused and intricate mass of what in English law is called *pleading*, reduces itself to these clear and simple elements. A begins by affirming some one of the facts which gives commencement to a right. B may deny this fact directly. A affirms contract, for example; B denies it; and then of course comes the evidence. Or, instead of denying it, B may affirm an antecedent fact which deprived the fact affirmed by A of its investitive force; or he may affirm a subsequent fact, which put an end to the right. In those two cases in which B affirms a new fact, A must be called upon for a reply; in other words, asked whether he admits or denies it. If he admits, there is an end of course to the claim of A. If he denies, then again we have affirmation and denial upon a matter of fact, which is to be determined by the production of evidence.

This is the first part of the proceeding, neither intricate nor obscure. The next is, the adduction of evidence. A fact is disputed; affirmed on the one side, denied on the other. A produces evidence to prove the fact, B produces evidence to disprove it. The decision is on the one side or the other, and the dispute is at an end.

If both parties obey the decision, there is no occasion for another act. If the losing party disobeys, force is necessary to compel obedience. This is called execution, and terminates the agency required.

It is needless to particularize a penal proceeding, all the possible varieties of which fall under one or other of the cases illustrated.

Thus, when a man is charged with a crime, the prosecutor affirms one of the acts violating rights, to which punishment is annexed by the legislator. The defendant can meet this affirmation in one of two ways only. First, he may deny the act, and then the second stage of proceeding, the adduction of evidence, immediately takes place. Or, not denying the act, he may affirm some previous act, which prevented it from having the effect of violating a right. Not denying the fact of taking the horse out of the field with a view to appropriate him, he may affirm a previous purchase, gift, &c. The adduction of evidence has nothing peculiar in the case of a penal proceeding at law. In the last stage, that of execution, the peculiar act of inflicting punishment is required.

Having thus a view, though very summary, of the operations required, we shall be the better able to judge of the agents necessary for the performance.

The stages, we have observed, are three. The *first* is that in which the plaintiff adduces the fact on which he relies, and is met by the defendant either with a denial of the fact, or the affirmation of another fact which, to maintain the suit, the plaintiff must deny. The *second* is that in which evidence, to prove or disprove the fact on which the affirmation and denial of the parties ultimately rests, is adduced and decided upon. The *third* is that in which the operations are performed necessary for giving effect to the sentence of the judge.

First stage of the judicial business.

What is desirable in the operations of the first stage is, 1*st*, That the affirmations and negations with respect to the facts should be true; and, 2*dly*, that the facts themselves should be such as really to have the quality ascribed to them. For the first of these purposes, all the securities which the nature of the case admits of, should be taken, for the veracity of the parties. There is the same sort of reason that the parties should speak truly, as that the witnesses should speak truly. They should speak, therefore, under all the sanctions and penalties of a witness. They cannot, indeed, in many cases swear to the existence or non-existence of the fact, which may not have been within their cognizance. But they can always swear to the state of their belief with respect to it. For the second of the above purposes, namely, that it may be known whether the facts affirmed and denied are such as to possess the quality ascribed to them, two things are necessary: the first is, that all investitive and divestitive facts, and all acts by which rights are violated, should have been clearly predetermined by the legislature; in other words, that there should be a well-made code: the second is, that the affirmations and denials with respect to them should be made in the presence of somebody capable of telling exactly whether they have the quality ascribed to them or not. The judge is a person with this knowledge, and to him alone can the power of deciding on matters so essential to the result of the inquiry be intrusted.

To have this important part of the business done, then, in the best possible way, it is necessary that the parties should meet in the very first instance in the presence of the judge. A is asked, upon his oath, to mention the fact which he believes confers upon him or has violated his right. If it is not a fact capable of having that effect, he is told so, and his claim is at an end. If it is a fact capable of having that effect, B is asked whether he denies it; or whether he affirms another fact, either one of those which, happening previously, would prevent it from having its imputed effect, or, in a civil case, one of those which, happening subsequently, would put an end to the right to which the previous fact gave commencement. If he affirmed only a fact which could have neither of these effects, the pretension of B would be without foundation.

Done in this manner, the clearness, the quickness, and the certainty of the whole proceeding are demonstrated. Remarkable it is, that every one of the rules for doing it in the best possible manner is departed from by the English law, and that to the greatest possible extent. No security whatsoever is taken that the parties shall speak the truth; they are left with perfect impunity, aptly by Mr Bentham denominated the *mendacity-license*, to tell as many lies as they please. The legislature has never enumerated and defined the facts which give commencement, or put a period to or violate rights; the subject, therefore, remains in a state of confusion, obscurity, and uncertainty. And, lastly, the parties do not make their affirmations and negations before the judge, who would tell them whether the facts which they allege could or could not have the virtue ascribed to them; they make them in secret and in writing, each along with his attorney, who has a motive to make them, not in the way most conducive to the interests of his client, but in the way most conducive to his own interests, and those of his confederates, from the bottom to the top of the profession. First, A, the plaintiff, writes what is called the declaration, an instrument for the most part full of irrelevant absurdity and lies; and this he deposits in an office, where the attorney of B, the defendant, obtains a copy of it, on paying a fee. Next B, the defendant, meets the declaration of A, by what is called a plea, the form of which is not less absurd than that of the declaration. The plea is written and put into the same office, out of which the attorney of the opposite party obtains a copy of it on similar terms. The plea may be of two sorts; either, 1*st*, a dilatory plea, as it is called; or, 2*dly*, a plea to the action. To this plea the plaintiff may make a *replication*, proceeding through the same process. To the replication the defendant may put in a *rejoinder*. The plaintiff may answer the rejoinder by a *sur-rejoinder*. This, again, the defendant may oppose by a *rebutter*, and the plaintiff may answer him by a *sur-rebutter*.

All this takes place without being once seen or heard of by the judge; and no sooner has it come before him than some flaw is perhaps discovered in it, whereupon he quashes the whole, and sends it to be performed again from the beginning.

This mischievous mess, which exists in defiance and mockery of reason, English lawyers inform us, is a strict, and pure, and beautiful exemplification of the rules of logic. This is a common language of theirs. It is a language which clearly demonstrates the state of their minds. All that they see in the system of pleading is the mode of performing it. What they know of logic is little more than the name.

The agency necessary for the performance of this portion of the business is some person who, when he hears a fact affirmed and denied, can tell whether it is one of those facts to which the legislature has attached the power of giving commencement or of putting a period to rights. It is evident, that on such occasion any one person, with the requisite knowledge, attention, and probity, is as competent to the task as a hundred. If he is single, the attention and probity is likely to be the greatest, as responsibility is not weakened merely, it is almost annihilated, by being shared. There should be one judge, therefore, and not more, to superintend that branch of procedure which consists of pleading.

ond ge of the cial iness.

The agency best adapted to the business of the second stage of judicature is that which next demands our attention. It is the business of taking evidence; in other words, the doing all that is necessary to ascertain whether the disputed fact happened, or did not happen.

The subject of evidence is a matter of complexity in the detail. And where any thing complex is to be stated in words, there is always difficulty in the expression, how plain soever the ideas. Such general considerations, however, as we can even here adduce, will, we hope, throw sufficient light upon the subject, to leave no doubt with respect to the conclusions which we have it in view to establish. This is one of the topics connected with law which Mr Bentham has exhausted, though a small part only of what he has written upon it has yet seen the light.[1]

With respect to all facts legally operative, that is, which give or take away rights, it is desirable that evidence amounting to proof should if possible always exist. With respect to a great proportion of them, it is in the power of the legislature to take measures that evidence of them shall be collected at the moment of their happening, and shall be preserved. This is the case with all those of which an evidentiary writing can be made and preserved by registration; all contracts, births, deaths, marriages, and so on. The proportion is really very great of the whole number of facts legally operative, in regard to which a legislature, by proper means, might secure the existence of evidence, and to that extent might either prevent disputes, or render the decision of them easy. That so little of this most important and obvious work has anywhere been done, only shows how ill the legislatures of the world have hitherto performed their duty. It is in the power of the legislature, by a proper classification, to have an accurate formulary for the different species of *contracts*, *wills*, and other *evidentiary writings*. Those formularies, properly made and printed with blanks to fill up, would render the business of *conveyancing*, which in England is a boundless, trackless, and almost impenetrable jungle, abounding with expense, with delay, and vexation to parties, with wealth and almost boundless power over the fortunes of other men to lawyers, a thing of the greatest simplicity, certainty, and ease.

Into the question of what might be and ought to be done by the legislature, for making and preserving evidence of the principal facts by which rights are made to begin or to end, we cannot enter at length on the present occasion. The great importance of the subject is evident from what we have thus shortly advanced.

The business of him who is only called upon to determine whether a disputed fact did or did not happen, is, to make the best use of all the evidence which exists, whether it were or were not desirable that more had been made to exist. For the best use of that which exists, three things are necessary:

1*st*, That the whole of it should be made to bear, that is, should be taken and applied.

2*dly*, That it should be taken in those circumstances which are most conducive to trust-worthiness.

3*dly*, That the proper value should be set upon each article, and upon the whole.

1. That the evidence may be taken as completely as possible, two things are necessary. The first is, that the judge should have power to send for, and to compel the attendance of, all persons and things which may be capable of affording evidence. The second is, that the evidence should all be taken, and nothing be omitted or lost.

It is not necessary here to enter into any details with respect to the first of those requisites. The necessity of the power is obvious, and the end to be attained is so precise and perspicuous, that there can be no difficulty in conceiving the mode of putting together and applying the means. There is no limit, it is obvious, to the physical power which should be placed at the disposal of the judge. He ought to have the right of calling upon every man, upon the whole community, to aid him in any act which is necessary to the performance of any part of his judicial duty; because any force opposed to the performance of that duty, there ought to be a force sufficient promptly to overcome. It is convenient, however, to the community, instead of being liable to be called upon individually, for the performance of the ordinary services auxiliary to the business of the judge, to provide him with a proper number of officers paid for attending to execute his commands. Their principal business, as regards this stage of the judicial proceedings, is, to serve notice upon any persons whose own presence, or that of any writing or other thing which they may possess, is required by the judge. Persons or things subjected immediately to the operations of judicature have a particular name in English. They are said to be *forthcoming*, a word which has an exact equivalent in few other languages, and is exceedingly appropriate and useful. It is of the greatest convenience, when a concrete term, the use of which is very frequent, has an abstract term corresponding to it; as good has goodness; hard, hardness; and so on. There was not any word in the language corre-

[1] This part of Mr Bentham's writings has been presented to the public by Mr Dumont, the first of translators and redacteurs, in that happy form which he has given to other portions of that philosopher's manuscripts.

sponding in this way to *forthcoming*. Mr Bentham, perceiving the great need of it, made the term *forthcomingness;* not exceptionable on the score either of harshness or obscurity. The small wits thought proper to laugh at him. We shall, nevertheless,—sorry at the same time that we cannot supply a defect in the language without offending them,—make use of the word, in which we find great appropriateness and great convenience. This particular branch, therefore, of the judicial agency, is that which relates to *forthcomingness;* and forthcomingness is required for two purposes, both for evidence and for justiciability; for evidence, that a true decision may be passed; for justiciability, that the sentence of the judge may not fail of its intended effect.

So much with respect to the forthcomingness of evidence. The second condition required to give the decision the benefit of all existing evidence is, that the whole should be taken, and that not any part of it which can be taken without preponderant inconvenience should be excluded and lost.

Of the several articles of evidence, some will always be of more importance, some of less; and some may be of very little importance; but whether of little or of much, it is always desirable that all should be taken, and every the smallest portion counted for what it is worth. The discovery of truth is promoted by taking advantage of every thing which tends to throw light upon the subject of dispute.

These propositions it may appear to be useless, indeed impertinent, formally to state. They are too evident, it may be said, to be disputed, and too important to be overlooked. Important as they are, and undisputed by all the rest of the world, they are not only disputed, but trampled upon, by lawyers, especially English lawyers. They have unhappily established a set of rules in direct opposition to them. These rules they applaud in all forms of expression, and celebrate as guards and fences of all that is dear to mankind.

In all causes, they have determined that persons so and so situated, things so and so situated, though apt to be pregnant with information beyond all other persons and things, shall not be admitted as sources of evidence. Thus, in English law, we have incompetency of witnesses, that is, exclusion of them, 1*st,* from want of understanding; 2*dly*, from defect of religious principle; 3*dly*, from infamy of character; 4*thly*, from interest. These are undisguised modes of exclusion; besides which, there is an extensive assortment of disguised modes. Under this title comes the rule, that only the best evidence be given which the nature of the case admits of; according to which, it often happens that the only evidence which can be had is excluded. Under this title also falls the rule, making certain kinds of evidence conclusive, by which proceeding all other evidence is excluded. To the same list belongs the rule that hearsay evidence is not admissible. The rules, so extensive in their application, by which writings are wholly rejected, only because they want certain formularies, are rules of exclusion; and so are the limitations with respect to time, and to number of witnesses. Into the very extensive subject, however, of the absurdity and mischievousness of the rules of evidence in English law, we cannot pretend so much as to enter. A remarkable exemplification of them was afforded on the trial of Warren Hastings, to which, for this purpose, the reader may be referred. (See Mill's *History of British India*, book vi. chap. ii.)

The only conceivable reasons for the exclusion of evidence are three:

1. Irrelevancy.
2. Inconvenience in obtaining and producing.
3. Danger of deception.

With regard to irrelevancy, the decision is clear. What has no tendency either to prove or disprove the point in question, it would be loss of time to receive.

With regard to inconvenience, it is no doubt liable to happen, that when all the good which can be expected from the obtaining of a lot of evidence is compared with the evil of the delay, cost, and vexation, inseparable from the obtaining of it, the evil may be more than an overmatch for the good. In all such cases it is expedient that the lot of evidence should be foregone.

As a guard against the danger of deception, it is equally certain that no evidence ought ever to be excluded. An account of all the reasons by which the absurdity of exclusion on this ground is demonstrated, and of the wide and deplorable mischief which, in the vulgar systems, is produced by it, would be far too extensive for the contracted limits of the present discourse. Reasons, however, decisive of the question, present themselves so obviously, that hardly any man, with an ordinary understanding, not fettered by prejudice, can look at the subject without perceiving them.

If evidence is to be received from no source from which evidence, liable to produce deception, is capable of coming, evidence must not be received at all. Evidence must be received from sources whence false evidence as well as true is liable to flow. To refuse all information from such sources, is not the way by which a knowledge of the truth can be obtained. This is the way to make sure of not having that knowledge. The means of obtaining it are, to receive information from every possible source, and to separate the bad from the good, under all those securities, and by the guidance of all those marks, of which understanding and attention know how to avail themselves.

It is not enough to say, we will receive information from those sources only which are least likely to yield deceptious evidence, refuse to receive it from those which are most likely. You are obliged to receive it from sources differing in almost all possible degrees of likelihood. Where are you to draw the line of separation? Is not the same discernment which guards you against the danger of false information from the sources which you deem the least likely to yield it, sufficient to guard you against it from those sources which you deem the most likely to do so? In fact it will be still more sufficient, because in this case you will be much more apt to be upon your guard. The very best information is, in truth, liable to be derived from the very worst of sources,—from a man who, you know, would not tell you one word of truth if he could help it.

The securities that a man will give true information, independently of those artificial securities which the legislature can apply equally to all, are, 1*st*, intelligence; 2*dly*, probity; 3*dly*, freedom from interest. Suppose that one or two or all of these securities are wanting, it only follows, that what he states should be heard with a proportional distrust. It may still be of the utmost importance to the discovery of the truth that he should be heard. Hear him with the proper allowances. This must always be more favourable to the discovery of the truth, than that he should not be heard at all. His testimony may appear, when heard, to be utterly unworthy of credence. But that could not be known till it was heard and examined. It might have so been, that it was not only worthy of credence, but completed the proof of a fact of the greatest possible importance. That a man should not be heard as a witness, on account of his religious creed, is an absurdity which we cannot descend to notice.

2. The second of the three things which we found necessary, as above, for making the best use judicially of whatever evidence to the fact in question exists, was, that it should be taken under those circumstances which are most

conducive to trust-worthiness. Those circumstances are constituted by the artificial securities, which arrangements can be made to apply. The following enumeration of them has been made by Mr Bentham (*Introduction to the Rationale of Evidence*, p. 54), and appears to be complete.

1. Punishment.
2. Shame.
3. Interrogation, including counter-interrogation.
4. Counter evidence,—admission of.
5. Writing,—use made of it for giving permanence, &c. to evidence.
6. Publicity,—to most purposes, and on most occasions.
7. Privacy,—to some purposes, and on some occasions.

For developing the import of these several securities, we can afford to say nothing. The principal operation of the judicial functionary in this part of the business is, to preside over the interrogation; to see that it is properly and completely performed. The question, then, what is the sort of agency best adapted for the performance of this part of the task of taking evidence, is not difficult to answer. There is nothing in it which one man, with the proper intellectual and moral qualifications, is not as capable of performing as any number of men.

3. All the existing evidence being collected and received, it only remains that the proper value should be attached to the several portions, and a corresponding decision pronounced.

It is sufficiently evident that, for the performance of this duty, no very precise instructions can be laid down. The value which belongs to an article of evidence often depends on minute and almost indescribable circumstances; and the result must be left to the sagacity and conscience of the judge.

At the same time, however, service to this end, and of the greatest importance, may be, and of course ought to be, rendered by the legislature. The different marks of trust-worthiness may, to a certain extent of particularity, be very correctly described. This being done, the difference between the value of any two lots of evidence to which those marks attach may be very exactly ascertained. One has a certain number of the marks of trust-worthiness, as laid down by the legislature; another has all these and so many more; the result is clear. It is evident, that as far, in this respect, as experience and foresight can go, nothing should be left undone by the legislature.

Another important service can be rendered by the legislature, and that is, to provide an accurate language for the judge; a language in which he can express precisely the degree of value which he allots to each article of evidence, and to the whole. Various expedients may be adopted for this purpose. A very obvious one is, to fix upon some particular, well-known article of evidence, the value of which all men appreciate equally; the clear testimony, for example, of a man of the ordinary degree of intelligence and probity, as a standard. Is the value to be expressed, which the judge attaches to any other article of evidence? If inferior to the standard, it falls below it by so many degrees, one, two, three, four; if superior, it rises above it by so many.

Having provided an accurate language, the legislature should take security that it be used; and admit of no vague and general expressions in the account of the value which the judge attaches to each article of the evidence on which he grounds his decision.

At the same time that the legislature insists upon the use of precise language in stating the value of evidence, it should insist upon reasons; upon receiving from the judge a precise statement of the grounds upon which he attaches such a value, and no other, to each and every article of evidence; that is, upon receiving a reference, as exact as language can give, to each of the circumstances which contributed to suggest to him that particular estimate which he says he has formed.

Of the importance of all these expedients we presume that no illustration is required.

Third stage of the judicial business.

We come now to the third and last stage of the business of judicature; when all that remains is to carry into effect the sentence of the judge.

When they upon whom the sentence operates are willing to obey, all that is necessary is to afford them notice of what it requires them to perform. In well-ordered countries, all but a very insignificant number will be found to be cases of this description. When opposition is to be overcome, a physical force must be provided, sufficient for the purpose. As there seems nothing mysterious in determining how this should be formed, and under what rules it should act, to secure the ends for which it is provided, with the smallest possible amount of collateral evil, we shall here take leave of the subject.

The judicial establishment, or the best form for giving effect to the laws.

VII.—We have now seen the whole of the operations to be performed. The parties are required to state before the judge the investitive or divestitive facts on which they rely. If they state, for this purpose, a fact which is not possessed of those qualities, they are immediately told that it is not possessed of them, and not calculated to support their claim. They come, by two or three steps at the longest, to a fact upon which the question ultimately turns, and which is either contested or not contested. In a great many cases it would not be contested. When the subject was stript of disguise, the party who had no right would generally see that he had no hope, and would acquiesce. The suit would thus be terminated without the adduction of evidence. When it was not, the cases would be frequent in which it might be terminated by the evidence which the parties brought along with them. In these cases, also, the first hearing would suffice. A vast majority of the whole number of suits would be included in these two sets of cases. For the decision of a vast majority, therefore, of the whole number of suits, a few minutes would suffice. When all the evidence could not be forthcoming at the first hearing, and only then, would a second hearing be required. In this mode of proceeding, justice would be, that without which it is not justice, expeditious and cheap.

In all this there is nothing which one man, with the appropriate intellectual and moral qualities, is not as competent to perform as any number of men. As one man is cheaper than any greater number, that is one reason why no more than one judge should be allowed to one tribunal.

The next object of inquiry is, to ascertain what securities can be provided that those who are intrusted with the business of judicature shall possess the requisite intellectual and moral endowments.

Securities for the intellectual endowments of the judge.

The intellectual endowments depend upon those who have the power of choosing and of dismissing the judges, and who do or do not appoint men whose knowledge and capacity are ascertained. The moral behaviour of the judges depends upon the interests which act upon them in the situation in which they are placed.

Into the question, who should have the appointment of the judges, we do not intend to enter. The answer would be different under different forms of government; and this is not the place to compare the different forms of government, either for this or any other of the ends of its institution. One thing only we shall state, because it carries its evidence along with it. Those who appoint the judges ought to have no interest contrary to the best administration of justice.

As the uprightness of the judge is assailed by interests inseparable from his situation, viz. the profit which he may derive from misdecision, it is necessary to counterbalance

Jurisprudence.

Securities for the moral qualities of the judge.

them by opposite interests, assuming the character of securities. Several of the securities which we have already seen applying to the situation of witness, apply also to the situation of judge: some are peculiar to each. The following is the list of those which apply to the situation of judge.

1. Punishment.
2. Shame.
3. Publicity.
4. Writing, for the sake of accuracy and permanency.
5. Singleness of the functionary.
6. Appeal.

For the *punishment* of the several kinds of judicial offences, provision ought to be made in the penal code.

In the case of the judge there is particular occasion to point accurately, and to strengthen to the utmost, the operation of *shame;* for in the situation of judge it is possible to be guilty of offences very numerous and very serious, without permitting so much of evidence to attach to any definite act, as would suffice to form a ground for punishment.

The great instrument for the application of shame is *publicity.* The importance of publicity, therefore, is paramount. It is not only the great instrument for creating and applying the moral sanction, the approbation and disapprobation of mankind; but it is of essential service towards the application of punishment, by making known the occasions on which it is deserved. It is not only a great security in itself, but it is the principle of life and strength to all other securities.

All other publicity is feeble and of little worth compared with that of the *press.* Not only, therefore, ought this to be allowed to operate with its utmost force upon the judge, but effectual provision ought to be made to cause it to operate upon him with its utmost force. Not only ought the judgment-hall to be rendered as convenient as possible for the reception of the public; not only ought the greatest freedom to be enjoyed in publishing the proceedings of the judge, and in publishing all manner of observations upon them, favourable or unfavourable; but measures ought to be taken to make a public, and to produce publication, where there is any chance that a voluntary public, and voluntary publication, would be wanting. For this purpose, unless other very important considerations intervene, the judgment-seat should always be in that place, within the district to which it belongs, where the most numerous and intelligent public, and the best means of publication, are to be had.

In England, where there is no definition of libel, and where the judges, therefore, are allowed to punish, under the name of libel, whatever writing they do not like, the publishing of unfavourable observations on the conduct of a judge, nay, in some instances, and these the highest in importance, the simple report of his proceedings, is treated as one of the most heinous of all possible offences. No wonder! Allow judges, or allow any men, to frame laws, and they will frame them, if they can, to answer their own purposes. Who would not, if he could, make a law to protect himself from censure? More especially if he were a man disposed to act in such a way as to deserve censure.

Would you allow falsehood to be published against the judge? The word falsehood is here ambiguous. It means both erroneous opinions, and false statements with regard to fact. Erroneous opinions we would undoubtedly permit, because we know no standard for ascertaining them, other than that which is afforded by public discussion; and because this is an adequate remedy for all the evil which erroneous opinions have any tendency to produce. Affirmation of facts injurious to the judge, if false, and made without reasonable grounds for having been believed to be true, we would prevent.

Allow facts injurious to the judge to be published, even when true; allow comments unfavourable to the judge to be made upon his actions, you discredit the administration of justice. Discredit the administration of justice, to which the people are resorting every day for the greatest of all possible benefits, protection from injury! As well talk of discrediting the business of a bread-baker, a meat-seller, if the fraudulent dealer is exposed to the censures of the public! Discredit the administration of justice, indeed, by taking measures of security against the vices of judges, indispensable for its perfection!

The importance of *recording, in permanent characters,* what takes place before the judge, we must content ourselves with assuming. We may do so, it is presumed, with propriety, on account of the facility with which the reasons present themselves. We must also leave it to our readers to draw the line of distinction between the occasions on which it is requisite, and the occasions on which it may be dispensed with; the occasions, for example, where everything is simple and clear, and all parties are satisfied.

It is a great security, both for diligent and for upright conduct in the judge, that he occupy *singly* the judgment-seat. When a man knows that the whole credit and reward of what is done well, the whole punishment and disgrace of what is done ill, will belong to himself, the motive to good conduct is exceedingly increased. When a man hopes that he can shuffle off the blame of negligence, the blame of unfairness, or fix a part of it on another, the uncertainty of the punishment operates, as we have already seen, to the diminution, and almost to the extinction, of its preventive force. Certain common, and even proverbial expressions, mark the general experience of that indifference with which a duty that belongs in common to many is apt to be performed. What is every body's business is nobody's. This is as true in the family as in the state; as true in judicature as in ordinary life. Much remains to be said upon this topic, which is one of great importance; but we must pass to the next.

Of the use of *appeal* as a security against the misconduct of the judge, there is the less occasion to adduce any proof, because it seems to be fully recognised by the practice of nations.

One thing, however, which is not recognised by that practice is, that if it is necessary in any one sort of causes, so it is in every other, without exception. Not a single reason can be given why it should exist in one set of cases, which is not equally strong to prove that it should exist in every other.

It is instructive to observe the cases in which it has been supposed that it ought to exist, and the cases in which it has been supposed that it might be omitted. The cases in which it has been thought necessary, are those which concern property of considerable value. Those in which it has been dispensed with are those which concern property of inconsiderable value. The first set of cases are those which are of importance to the aristocratical class, the second are those which are of no importance to that class. It is the aristocratical class who have made the laws: they have accordingly declared that the suits which were important to them should have the benefit of appeal; the suits not important to them should not have the benefit of appeal.

We recognise only one standard of importance, namely, influence upon human happiness and misery. The small sum of money for which the suit of the poor man is instituted is commonly of much greater importance to him, than the larger sum for which the suit of the rich man is instituted is to the rich. Again, for one rich man there are thousands and thousands of poor. In the calculation, then, of perfect benevolence, the suits for the small sums are not, as in the calculation of perfect aristocracy, those of the least, or rather no importance; they are of ten thousand times greater importance than the suits for the largest sums.

If an appeal ought to be had, how many *stages* should there be of appeal? This question, we imagine, is easily answered. If you go for a second judgment, you should, if possible, go to the very best source: and if you go at once to the best source, why go any farther?

What is required to be done, in the case of an appeal, is the first thing which deserves to be ascertained. An appeal takes place in consequence of a complaint against the previous judge. Where no complaint, there is no appeal, nor place for appeal.

A complaint against the judge must relate to his conduct, either at the first, the second, or the third stage, of the judicial operations.

If to his conduct at the first stage, it must be a complaint of his having permitted a party to rest upon a fact which had not the investitive or divestitive quality ascribed to it; and this implies either a mistake with respect to the law, or that he allowed the decision to turn upon a fact which did not embrace the merits of the question. It is evident that, for the decision of this question, all that is necessary is an exact copy of *the pleadings*, and transmission of it to the court of appeal.

If the complaint relates to his conduct at the second stage, it must turn upon one of two points; either that he did not take all the evidence, or that he did not properly determine its value.

If he did not take the evidence properly, by a failure either in assembling the sources of it, or in extracting it from them when assembled, the proper remedy is to send back the cause to him, with an order to supply the omission; or, if he be suspected of having failed wilfully, to send it to the judge of one of the neighbouring districts, to retake the evidence and decide.

If the complaint relates to a wrong estimate of the evidence, the statement of it transmitted to the court of appeal, with the reasons assigned by the judge for the value affixed to every portion of it, will enable the appellate court to decide.

With regard to the third stage, the only complaint there can be is, that the judge has not taken measures to execute his own sentence. If any inquiry is in this case to be made, the proper course is, that the appellate court refer it to one of the neighbouring judges. When a simple act is to be done, the proper order is to be despatched, and the proper penalties for non-performance exacted.

It thus appears, that for every thing which is required to be done by the appellate judicature, nothing whatsoever is required, as a foundation, but certain papers. The presence is not required either of parties or of witnesses.

As it is of no great consequence, in a country in which the means of communication are tolerably provided, whether papers have to be transmitted 50 or 500 miles, the distance, even though considerable, of the seat of the appellate jurisdiction is a matter of very little importance. The object, then, is to get the best seat; that is, the best public. The best public, generally speaking, is in the capital. The capital, then, is the proper seat of all appellate jurisdiction. And that there should be one judge, and one judge only, in each court of appeal, is proved by exactly the same reasons as those which apply to the courts of primary jurisdiction.

The question, how many courts there should be, as well of primary as of appellate jurisdiction, is to be determined by one thing, and one thing only; namely, the need there is for them. The number of the courts of primary jurisdiction must be determined, in some instances, by the number of suits; in some, by local extent. To render justice sufficiently accessible, the distance from the seat of judicature must not be great, though the number of accruing suits, either from the paucity or from the good conduct of the people, should be ever so small.

As the judgment-seat should never be empty, for the need of staying injustice is not confined to times and seasons, and as one judge may be sometimes ill, sometimes called to a distance even by the duties of his office, provision ought to be made for supplying his place. For this purpose, the proper expedient is a deputy. That the deputy should well perform his duty, the best security is, that he should be chosen and employed by the judge, the judge being responsible for the acts of the deputy as his own. Whatever it be which the judge cannot do, or cannot conveniently do, in that he may employ his deputy. If there is a great influx of causes, the deputy may be employed in some of the least complex and difficult. If there is any business not of first-rate importance, requiring the presence of the judge at a distance, the delegation of the deputy or deputies is the proper resource.

Besides the judge and his deputy, there are two adjuncts to every tribunal, which are of the utmost importance; indispensable, indeed, to the due administration of justice. These are, a *pursuer-general* and a *defender-general*. The business of both pursuer-general and defender-general is, to reclaim the execution of all laws in the execution of which the nation has a peculiar interest, though individuals may not. The peculiar business of the pursuer-general is to act on behalf of the administrative authority, in its character of plaintiff, and on behalf of every plaintiff who is without the means of engaging another advocate; to obviate any prejudice he sees likely to arise to justice from the conduct of plaintiffs, whether in civil matters or penal; and to perform, in the case of all offences where no private prosecutor appears, the office of prosecutor. The peculiar duty of the defender-general is to act on behalf of the administrative authority in its capacity of defendant, and on behalf of every defendant who has not the means of engaging another advocate, and to obviate any prejudice he sees likely to result to justice from want of skill or other causes on the part of a defendant who pleads his own cause, or on the part of the advocate who pleads it for him.

The courts of appeal, though all seated in the metropolis, ought to be as numerous as the speedy hearing of all the appeals which come to them requires. The judges of appeal ought all to be chosen from the judges of primary jurisdiction, not only on account of the education and the experience received, but as a step of promotion, and a proper motive to acquire the requisite education, and to merit approbation in the inferior employment. There is the same propriety, and for the same reason, in choosing the judges of primary jurisdiction from the deputies. (A. A. A.)

JURY, a certain number of men sworn to inquire into and try a matter of fact, and to declare the truth upon such evidence as shall appear before them.

JURY TRIAL. The method of trial by jury is one of the most ancient of judicial institutions; so ancient, indeed, that its origin lies beyond the commencement of authentic history amongst the nations of Europe, particularly in the north. In the earliest of the Scandinavian histories, it is spoken of or referred to as familiarly known. The oldest code of Iceland, composed in the beginning of the tenth century, also treats of it as an existing institution; and so also does the most ancient Norwegian code, the precise date of which has not been ascertained. Kofod Ancher, a sagacious critic and eminent lawyer, does not scruple to admit the authority of the Edda, from which it would appear that Odin had introduced this method of trial into Scandinavia. But all that the Edda says is, that Odin ordained the twelve Asagods to adjudge all causes in the metropolis of Asgard. It is curious to observe, however, that the old juries invariably consisted of twelve; a number which seems to characterise the institution as one of high antiquity; for as the verdict was commonly given by the majority, an uneven number would have been preferable, to avoid the contingency of an equality of votes. Saxo informs us, that Ragnar Lodbrok, who, according to Torfœus, governed Denmark between the years 750 and 790, first instituted trial by jury; but the authority of this monastic writer is not such as to induce us to attach much importance to his statement. In fact, the Edda is a much better historical authority than Saxo; and, according to that record, trial by jury is several centuries older than the commencement of Ragnar Lodbrok's reign, in the year 750 of our era. But the precise antiquity of this institution cannot now be determined. We find that it was in existence at the earliest dawn of northern history, and spoken of as a mode of trial then familiarly known; but beyond this all is conjecture. We can trace it as far back as a thousand years; this is the farthest limit to which legal antiquaries have carried their researches, the history of northern Europe, before that period, being involved in Cimmerian darkness.

It seems pretty certain, however, that, though trial by jury was early known in Scandinavia, yet it was not so generally resorted to before the beginning of the tenth century as afterwards. In these rude times, trial by battle often superseded trial by jury. Men of rank, or in other words warriors, always preferred it; they would have deemed it pusillanimous to submit any cause in which they were concerned to the decision of a jury. The weak and the aged alone claimed the benefit of this mode of trial; and women frequently appealed to it. Even after it had become common, the trial by battle, when demanded with certain legal formalities, was admitted in preference. In Scandinavia, however, this species of trial is of pagan origin; that is, it was in use prior to the introduction of Christianity into that northern region. But as the relations of society multiplied, and differences increased both in number and nicety, the inconvenience of such a mode of trial began to be felt. The *jus fortioris*, barbarous in itself, had no powers of adaptation. A man sometimes became involved in a new law-suit before he had recovered of his last wounds; some were prevented by the infirmity of age from prosecuting a cause in itself just; others had no male relations to espouse it for them; and a third class, though firmly convinced of the justice of their cause, were as fully persuaded of the superior strength or dexterity of their adversaries. Thus, the trial by battle became gradually unpopular; and hence, when the Christian faith began to be generally received, it rapidly declined, though without being entirely abolished.

In this state of things trial by jury would, in all probability, have become universal, if the clergy, who soon acquired great influence both with sovereigns and subjects, had not introduced a new mode of deciding causes. This was the Christian *ordeal*, which was more the result of circumstances than of any preconcerted design. The clergy had to preach a new faith to people slow of belief; and, as the arguments which they advanced in support of it were chiefly founded upon recorded or traditionary miracles, their sceptical hearers naturally asked, "Show us one such miracle, and we will believe." The validity of this reasoning has always been admitted by the Catholic clergy, who, accordingly, set about working miracles. Hence the origin of the Christian ordeal, which agreed with the trial by battle in this, that it was an appeal to heaven, though in a less rude and barbarous form. To a miracle said to have been performed by Bishop Pappo in Jutland, where, according to the legend, he put his hand in an iron glove red-hot, and withdrew it unhurt, is attributed the introduction of this method of trial into Denmark. This is a point which Ancher considers as established. But, whatever may have been the occasion of introducing it, the clergy endeavoured to substitute for every other kind of trial that which they called "the judgment of God;" and from this period the ordeal was frequently employed in all the countries of the north, particularly in Denmark, and in that part of Sweden called Scaney or Scania. In the code of laws still preserved, and known under the name of *Shaanske Lov*, or *Lex Scanica*, the ordeal of hot iron is expressly ordered to be employed, particularly in cases of theft. This mode of trial subsisted during two centuries and a half; but, though frequently employed during that period, it was always regarded with suspicion and distrust by the greater number of the laity. It afforded occasions for jugglery and deception to which the most ignorant could scarcely be altogether blind. By a little dexterity of management, the innocent might be condemned, and the guilty suffered to escape.

We have already seen that the insufficiency of the trial by battle was early felt, and that, as society advanced, the law of the stronger fell into disuse. The same fate likewise awaited the trial by ordeal, which, being substituted in its stead, long retarded the adoption of trial by jury. But, whilst each of these three modes struggled for pre-eminence, that by jury was always considered as the most *normal* or regular; and hence the appellation of *law*, which, in Denmark, was applied to a jury of a particular description. The trial by battle, and the ordeals, were no doubt recognised and admitted by the law; but every one felt that the trial by the country was the only one to which the term *legal* could with propriety be applied. That form of trial was the *law*, κατ' ἐξοχην, although the other forms were not contrary to the law; and this superior *legality* the ancients vindicated, in the strongest manner, by the term they employed. Thus, in the history of the northern judicatories, we recognise, first, the *trial by battle*; secondly, the *trial by ordeal*; and, thirdly, the *trial by jury*. This, however, is to be considered only as the order of general usage or practice; for, although some theorists have assumed that trial by battle is the most ancient mode, there is sufficient evidence to prove that which we have already stated, that amongst the northern nations trial by jury is at least of equal antiquity. In fact, it cannot be said that the most ancient codes sanction any other form of trial than that by jury. In none, not even in those of the tenth century, is the trial by battle even mentioned; and very few have prescribed the ordeals, which, being ecclesiastical inventions, must consequently be sought for chiefly in the ecclesiastical codes. But all the ancient laws abound with references to jury trial, and contain elaborate regulations respecting its form, applications, contingencies, and uses. Hence it may, with some confidence, be concluded that the trial by jury is the most ancient *strictly legal* mode of trial which obtained in the countries of the north.

The time was when it would have been considered necessary to inquire whether any enactment respecting jury trial occurs in the *Sachsenspiegel*; a code which, according to an opinion once universal amongst jurists, had been compiled in the time of Charlemagne. But Couring, in his work *De Origine Juris Germanici*, has demonstrated that the Sachsenspiegel was compiled subsequently to the year 1230, though soon after that period; and this is also the period to which a philologist, unaided by history or jurisprudence, would refer that compilation. In fact, the Sachsenspiegel itself contains evidence that it was composed after the council of Lateran, held in the year 1215; for it mentions a prohibition against matrimony in the fifth remove, which was first issued by that council under Innocent III., though the bull on the same subject was not published until 1230; and hence it is probable that the Sachsenspiegel was not compiled until after that year. But as jury trial had been introduced into Britain, and other northern countries, long before this period, it follows that the authority of the Sachsenspiegel (a crude collection of ancient customs, moral precepts, legendary divinity, and nursery tales), is of no avail whatever in the present question. Yet, even in this code, something may be found analogous to the institution of jury trial, though, upon examination, it will be found difficult to determine whether the mode of trial indicated in the Sachsenspiegel should not be considered as *wager of law*, rather than trial by jury in the strict acceptation of the terms.

The case is quite different with respect to the ancient Saxon as well as Frisian law, two codes (if that which may easily be printed on a sheet of paper deserves the name of code) of high antiquity. The Saxon law is written in Latin, a language unknown in Saxony before the time of Charlemagne. It was discovered in the library of Fulda, and first edited at Basil by John Herald, in the year 1557. It is a Christian code, addressed to the Saxons, over whom the ancestors of Charlemagne had no authority, and with whom they had little or no intercourse. Spelman (see his Glossary under the term *Lex Saxonum*) attributes this code to Harald Bluetooth, king of Denmark, who reigned about the middle of the tenth century; and in this opinion he is supported by Adam of Bremen, Helmold, and Albert. But are the laws which Harald gave to the Transalbians and Frisians identical with the *Leges Saxonum* of Fulda, and with the Frisian laws which Siccama edited? We cannot say that this is certain; but it is at least highly probable, and such undoubtedly was the opinion of Spelman. Mr T. G. Repp, who has discussed this subject with much learning and ability, sums up his reasoning by stating that the *Capitularia* and the *Leges* could not emanate from the same legislator; that the *Capitularia* are justly attributed to Charlemagne, who could not, therefore, be the author of the *Leges;* that, as the *Leges* abrogate an enactment of the *Capitularia*, the former are consequently of more recent date; and that, as there is only a question as to two legislators, if Charlemagne be not the author, the *Leges* must be ascribed to Harald.

From these codes, if they may be called such, we find that the Saxons had no juries in the strict modern acceptation of the term. They had only *wagers of law.* A man, when accused of a crime, either paid a certain fine, or, if he wished to establish his innocence, he convened a certain number of persons, before whom he cleared himself by oath of the crime with which he was charged. From the words used in the Saxon and Frisian law, it is not clear in what manner the *conjuratores* were bound to swear; but it seems probable that they only affirmed upon oath their belief that the accused was innocent. The number of the *conjuratores* varied according to the magnitude of the crime; and the fine, in case the accused failed to prove his innocence, varied in the same ratio. For crimes of the least aggravated kind only three compurgators were required; for those of a more heinous character six were necessary; and for such as were marked by peculiar atrocity, eleven, the accused himself being the twelfth. But there were some crimes for which no fine was deemed a sufficient expiation; and in these cases no wager of law is mentioned, because it was not allowed. From the nature and constitution of this mode of expurgation, it is obvious that unanimity was indispensable. This seems to be implied in the words *Undecima manu jurat;* nor could it well be otherwise, seeing that the accused chose his own jurors or compurgators.

Although Norway derived from Sweden the stock of its actual population, and the first seeds of civilization, yet, strangely enough, there are preserved Norwegian codes of higher antiquity than any now extant in Sweden. The history of Norwegian law has been divided into three periods; the first commencing in the reign of Hakon Athelstane, about the year 940; the second in the reign of Magnus, about 1274; and the third in 1397, at the union of Calmar. During all these periods, the trial by jury was more or less used, and invariably prescribed by law. In the first and second periods its use was universal, scarcely any cause of importance being decided without the intervention of a jury; but in the second period, the authority of the jury was modified by the judges acquiring greater authority in every judicial decision, and exercising, as they still do, an influence on the verdict; and, during the third, this authority and influence increased so greatly, that, by the end of the seventeenth century, the functions of the jury had become almost nominal, and, in many cases, were entirely superseded. The constitution of Norwegian juries is clearly explained in Lagabœtir's amended Law of Gulathing (b. i. c. 2 and 3), promulgated by King Magnus; *thing*, in the Scandinavian countries, signifying an assembly of the deputies of the people. The Lögman or Lawman presided, and his function originally was to recite the laws of the land, which he knew by heart; but after the promulgation of King Magnus's code, he had only to state the king's written law, to interpret it, and to point out the portion which applied to each particular case. It is not certain by whom, practically, juries were most frequently selected; but, from the northern codes, it appears that they might be chosen, first, by the deputies from their own number; secondly, by the lawman; thirdly, by the officers of the crown; and, lastly, by the parties themselves. It seems probable, however, that in Norway, juries were commonly chosen by the deputies. In the old Saxon, Danish, and Icelandic laws, a simple majority of the jury decided finally, and without appeal, in every case brought before them. But Magnus, in the event of a difference of opinion, gave the power of decision, not to the majority, but to the lawman along with the minority; reserving to himself the privilege of reversing their verdict, in the last resort, and, if he so pleased, affirming the deliverance of the majority. Further, by the code of this prince, the lawman was for the first time constituted a judge; the judicial authority of the crown was extended; unanimity was not insisted on, any more than in other Scandinavian laws; the king was virtually constituted supreme judge; and it was provided, that in all cases where the law did not decide, that was to be considered as the law which the jurors agreed upon.

We find jury trial described in the ancient codes of Sweden, a country where the regulations respecting it are in some instances stricter and more detailed than in Norway, where this institution has been more fully developed for the trial of every description of causes, and where, also, it has longer subsisted in full force. There were several kinds or species of jury in Sweden, viz the Lawman's, the Bishop's, and the Hundred's jury; but in all, the decision of the majority was final. The circumstances and ceremonies attending the election of jurors, the qualifications which rendered them eligible, the parties who elected them, the oath which they took before proceeding to try a case, and the validity of their deliverance or verdict, together with the functions of the lawman, will all be found stated and explained in Mr Repp's very curious book, to which the reader is referred. The king's jury consisted of twelve, and constituted a species of appeal court; it took cognisance of all offences against the public law of the state calculated to disturb or molest the people; and its decision was in every case final. No servant could be a juror; they required to be men having a fixed residence; and persons of infamous character or lawless habits were also excluded. The absence of a juror subjected the absentee to a heavy fine. Causes of every description appear to have been tried by Swedish juries. Important questions of property, as well as criminal cases of every kind, were referred to their decision; they formed a sort of mixed tribunal, by which the law as well as the fact was determined; and, in particular circumstances, they acted as a court of review, as in the case of the king's jury on the Landsthing, before which causes o. great importance came ultimately for decision. In fact, the only limitation (if limitation it may be called) in the authority of the jury to judge and decide, consisted in this, that cases of minor importance which occurred between terms, were adjudicated by the magistrate or the lawman, whilst all causes of moment were reserved for the cognisance of the jury.

The subject of Danish juries has been ably treated by Peter Kofod Ancher, for many years professor of the civil law in the university of Copenhagen, a writer who, in his *Dansk Lovhistorie* (Copenhagen, 1769–1776, in 2 vols. 4to), has surveyed ancient judicial institutions with a scrutinising eye. Ancher is by no means an admirer of this form of trial; but, as he is a conscientious and critical historian, he takes pains to place every fact in its true light, without reference to his own particular views or opinions. According to him, there were four kinds of persons employed in the ancient courts of Denmark to adjudicate causes; and these were either regular jurors, or *conjuratores* in a wager of law, or persons who, from the principles on which they were nominated, resembled these. He then proceeds to consider each of the four classes separately, viz. first, the *Tingmænd* or Thingmen, that is, those who frequent a Thing, or are enjoined by law to be present at it; secondly, the *Nævninger*, or regular juries, an institution of very high antiquity in Denmark; thirdly, the *Sandemænd* or Truthsmen, who were employed for deciding important causes, and took cognisance of homicide, cutting and maiming, rape, armed aggression, disputes respecting boundaries, and questions in which church property was concerned; and, lastly, the Wager of Law in Denmark. For ample details under each of these heads, we refer to Ancher's work above mentioned, and also to the distinct and satisfactory abridgment of his investigations, given by Mr Repp in his book on Ancient Juries. It is sufficient to state here, that in Denmark trial by jury was not resorted to excepting in causes of importance, and that particular care was taken that none but good and impartial men should be chosen as jurors. They were selected from the inhabitants of a district generally; no friend or relative of the parties could be chosen; and they required to be men of substance, "three-marks-men," who could pay a compensation to the injured party, in case they found a wrong verdict. The number of Danish jurors was originally twelve, a number common to all the northern countries; but, at subsequent periods, the law of Denmark in this respect was somewhat changed. In Scania the jurors were twelve, but the accused was permitted to challenge three; and the Scanian law provided that the prosecutor should either nominate fifteen, or that, if three were challenged, he should pray a *tales* to complete the number twelve. The Jutland law, chary of numbers, provided that there should only be eight jurors in each hundred, or two in each quarter; but *kindred jury*, as it was called, consisted of twelve, as well as juries which took cognisance of forgery, arson, and highway robbery. By the law of Erik, the number of jurors in the more important class of cases was *thirteen*, and in the less important *seven*, that is, twelve, and the half of twelve, with one additional to secure a majority. In fact, the basis of all the numbers of jurors is the number twelve. In Denmark, as in Sweden and in Iceland, the cause was decided by the suffrages of the majority of the jurors impannelled in each case.

From these historical notices, it appears that trial by jury, in one or other of the various forms under which it is found, was not only of great antiquity amongst the northern nations, but employed to an extent of which, in this country, we have hitherto had no adequate conception. Nor can it be doubted that, for the institution which we now justly regard as the palladium of liberty, and one of the best safeguards against the arbitrary abuse of power, and which time and experience have enabled us to adapt to a more advanced state of society, we are indebted to those nations which we are perhaps a little too prone to undervalue, and which, even at a period of comparative barbarism, seemed to have fully divined the benefits which might accrue from this mode of deciding causes, whether civil or criminal. For accounts of the origin, progress, and improvement of jury trial in our own country, we must refer the reader generally to its history, and, in a particular manner, to the different institutional writers. (See Repp's *Historical Treatise on Trial by Jury, Wager of Law, and other co-ordinate Institutions;* also Blackstone's *Commentaries on the Law of England*, b. iii. c. 22, § 6.) (A.)

JUS DELIBERANDI, in *Scotch Law*, that right which an heir has, by law, of deliberating for a certain time whether he will represent his predecessor.

Jus Devolutum, in *Scotch Law*, the right of the church to present a minister to a vacant parish, in the event of the patron neglecting to exercise that right within the time limited by law.

Jus Mariti, in *Scotch Law*, the right which the husband acquires to his wife's moveable estate, in virtue of the marriage.

Jus Relictæ, in *Scotch Law*, the right which the wife has in the goods in communion, in case of the previous decease of the husband.

Jus Preventionis, in *Scotch Law*, the preferable right of jurisdiction acquired by a court, in any cause to which other courts are equally competent, by having exercised the first act of jurisdiction.

Jus Civile, amongst the Romans, signified no more than the interpretation given by the learned, of the laws of the Twelve Tables, though the phrase is now extended to the whole system of the Roman laws.

Jus Civitatis signifies the freedom of the city of Rome, which entitled those persons who had obtained it to most of the privileges of Roman citizens; yet it differed from the *Jus Quiritium*, which extended to all the advantages which a free native of Rome was entitled to. The difference, in fact, was much the same as that between *denization* and *naturalization* with us.

Jus Honorarium was a name given to those Roman laws which were made up of edicts of the supreme magistrates, particularly the prætors.

Jus Imaginis was the right of using pictures and statues amongst the Romans, and had some resemblance to the right of bearing a coat of arms amongst us. This honour was allowed to none but those whose ancestors or themselves had borne some *curule office*, that is, had been *Curule Ædile*, *Censor*, *Prætor*, or *Consul*.

The use of statues or pictures, which the *Jus Imaginis* conferred, was that of exhibiting them in funeral processions.

Jus Papirianum included the laws of Romulus, Numa, and other kings of Rome, collected into a body by Sextus Papirius, who lived in the time of Tarquin the Proud.

Jus Trium Liberorum was a privilege granted to such persons in the city of Rome as had three children, by which they were exempted from all troublesome offices. The same exemption was granted to any person who lived in other parts of Italy having four children; and those who lived in the provinces, provided they had five, or, as some say, seven children, were entitled to the same immunity.

JUSSIEU, Antoine de, doctor of physic, professor of botany in the Royal Garden at Paris, and a member of the *Académie des Sciences*, was born at Lyons in the year 1686, and educated at Montpellier, where he took his degree of doctor of physic, after which he became associated with the faculty of Paris. Although much occupied in the practice of medicine in the capital, he was ardently devoted to the study of botany, having, in the earlier part of his life, visited Spain and the southern provinces of France in search of plants. When stationary at Paris, he communicated various essays to the academy, which are printed in its *Mémoires.* These are chiefly botanical, illustrating the characters or the qualities of various exotics, at that period not well known; but he has given several papers also, on extraneous fossils, and a few other subjects of natural history. He furnished the two *Appendices* to Tournefort's *Institutiones Rei Herbariæ*, and edited the *Icones* of Barrelier. He also published an historical account of the magnificent collection of drawings of plants and animals, originally begun under the auspices of Gaston duke of Orleans, and continued down to the present times. When Linnæus visited Paris in 1738, he, in a letter to Haller, mentioned the elder Jussieu, as "much engaged in medical practice, well versed in the knowledge of the species of plants, though too prone to multiply them, and strictly confined to the ideas and principles of Tournefort." In one important point, however, which could hardly escape Linnæus, and ought not to be forgotten, he emancipated himself from the errors of his master, for he perfectly understood, and fully admitted, the doctrine of the sexes of plants. A letter of his, completely explaining this phenomenon on the most correct principles, is given by Bradley, in his *Philosophical Account of the Works of Nature* (p. 25–32). He died of an apoplectic fit, at Paris, on the 22d of April 1758, aged seventy-two.

Jussieu, *Bernard de*, younger brother of the preceding, and, like him, a physician, and a member of the *Académie des Sciences*, was still more devoted to the philosophical as well as practical study of botany, and ranks amongst the greatest names in that science, as having first attempted to form a system according to the *natural affinities of plants.* He was born at Lyons in 1699, and appears to have accompanied or followed his brother to Paris, where he occupied, under him, the place of botanical demonstrator in the *Jardin du Roi*, and at length succeeded him as professor of botany. If his communications to the academy were less numerous than those of his brother, they were of a rather superior character. In one of them, published in the *Mémoires* of that body for 1742, he enters on the subject, then scarcely touched by any person, of the animal nature of certain marine productions, previously taken for plants; and we perceive, in his inquiries, dawnings of that meridian light which our countryman Ellis afterwards threw on these curious tribes. On other occasions he explained the flowers of the *Littorella*, and, with much acuteness, the more obscure fructification of the *Pilularia.* He wrote, in conjunction with the learned Comte de Caylus, on the *Papyrus;* and he gave an improved edition of Tournefort's *History of the Plants about Paris*, in 1725.

Linnæus became personally acquainted with this ingenious man at Paris in 1738, and maintained, for some years, an intimate correspondence with him. They could not be long in each other's company without discussing the natural affinities of plants; a study which seems to have been much advanced, if not first excited, in the mind of Linnæus, by his correspondence with Haller. Bernard de Jussieu had probably about the same time been led to consider it by his own contemplations; for the system of Tournefort, in which he was educated, is too artificial in principle to have given him any such ideas. In its execution, indeed, that great author is led, by his own good sense, into some natural and philosophical views, even in spite of his system; and these may possibly have caught the attention of Jussieu. However this may be, mutual satisfaction and instruction could not but flow from the intercourse of Bernard de Jussieu and Linnæus. They traced out together the characters and the limits of various natural assemblages or orders. Every day produced, and every letter communicated, some new discovery. But as the multifarious hordes of the north appear originally to have used one common tongue, which, after they were dispersed, divided, and cultivated, when it came to be written, assumed the form of various distinct languages; so these two botanical philosophers, when their more intimate intercourse had ceased, pursued different paths, and went far towards different conclusions. Linnæus, after throwing the whole vegetable creation, more or less completely, into natural groups, became more and more persuaded that it was not only impracticable to connect them by one synoptic clue or system, but that not one of his assemblages or orders was capable of precise and unexceptionable definition. On the other hand, Bernard de Jussieu, to the last, aimed at a general scheme of classification, though he accomplished little more than throwing his several orders into larger assemblages, and disposing the whole, as indeed Linnæus himself has done, in one series, according to their relationship to each other. The French botanist is recorded to have spoken with great diffidence of his own performance, and he has written nothing of a general classification. But he often gave hints, in lectures or conversation, by which others perhaps profited. This appears from the preface to the *Genera Plantarum* of his distinguished nephew, Antoine Laurent de Jussieu, botanical professor at Paris, who, following up the ideas of his uncle, and sacrificing something to technical convenience, at the expense of nature, contrived to exhibit a tolerably natural system, founded on methodical principles.

It would be to little purpose to discuss, at the present day, the claims of Linnæus or of Bernard de Jussieu to originality in the study of natural orders. Professor de Candolle has justly asserted, that they had the same object in view, and adopted, in the main, the same principles. Bernard de Jussieu having, in a letter dated the 15th of February 1742, congratulated Linnæus on his appointment to the botanical chair at Upsal, says, "*Floræ devotus omninò poteris viam quam monstrasti facilem ampliùs aperire, naturalemque methodum tandem perficere, quam desiderant et expectant botanophyli omnes.*" In a subsequent letter of the 7th May, 1746, he also tells his Swedish friend, "*Scio quantum emolumentum receperint qui secundum tua principia student; memet experientia docuit.*" This is enough to settle the question, though great allowance is perhaps due to the modesty of Jussieu, who was less disposed to honour himself than his friend.

His biographer, the celebrated Marquis de Condorcet, records his singularly amiable and unaffected manners. These, during his occupation of arranging, according to natural classes, the garden of Trianon, attracted the notice and esteem of his sovereign, Louis XV. to whom any unsophisticated character or object could not but form an agreeable relaxation from the routine of a court. Jussieu obtained plants and seeds to be sent to his friend in the king's name. He pursued his innocent and useful studies till his death, which happened in 1777, in his seventy-ninth year.

A compendious view of his nephew's system, and a comparison of their natural orders with those of Linnæus, may be seen under the article BOTANY.

JUST, or JOUST, a sportive kind of combat on horseback, man against man, armed with lances. The word is by some derived from the French *jouste*, formed from the Latin *juxta*, because the combatants fought near one another. Salmasius derives it from the modern Greek *zoustra*, or rather ζουστρα, which is used in this sense by Nicephorus Gregorius. Others derive it from *justa*, which in the corrupt age of the Latin tongue was used for this exercise, because it was supposed to be a juster and more equal combat than that of the tournament.

The difference between jousts and tournaments consists in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports and engagements made for gallantry and diversions. Jousts were those particular combats where the parties were near each other, and engaged with lance and sword. It may be added, that the tournament was frequently performed by a number of cavaliers, who fought in a body; whereas the joust was a single combat of one man against another. Though the jousts were usually made in tournaments after a general rencontre of all the cavaliers, yet they were sometimes singly, and independent of any tournament. (See CHIVALRY and TOURNAMENT.)

JUST, *St*, a parish of Cornwall, in the hundred of Powder, 269 miles from London, in which is comprehended the borough-town of St Mawes. It is opposite to the port of Falmouth. The inhabitants amounted in 1801 to 1416, in 1811 to 1639, in 1821 to 1648, and in 1831 to 1558.

JUST, *St*, a large parish of the county of Cornwall, in the hundred of Penwith, 295 miles from London. It is in one of the mining districts, which affords employment to the inhabitants, who amounted in 1801 to 2779, in 1811 to 3057, in 1821 to 3666, and in 1831 to 4667.

JUSTICE, in a moral sense, is one of the four cardinal virtues, which consists in giving every person his due.

Civilians distinguish justice into two kinds, *communicative* and *distributive*. The former establishes fair dealing in the mutual commerce between man and man, and includes sincerity in our discourse, as well as integrity in our dealings. *Distributive* justice is that by which the differences of mankind are decided according to the rules of equity. The former is the justice of private individuals, the latter that of princes and magistrates.

JUSTICE is also an appellation given to a person deputed by the king to administer justice to his subjects, and whose authority arises from his deputation, and not by right of magistracy.

JUSTICE-CLERK OF SCOTLAND, the vice-president of the Court of Justiciary, in absence of the lord-justice-general. This officer was originally no other than the clerk to the Justiciar or Justice Court of Scotland, as the name indeed imports; and his progress from the table to the bench is singular, and not a little curious.

In early times there were two justice-clerks, as there were likewise two justiciars, one on either side of the Forth; and as the jurisdiction of the Justice Court was then nearly universal in respect of the matters cognisable there, and very high in degree, the office of clerk was of considerable importance, and enjoyed by persons of station in society. Thus we find that Adam Forrester of Corstorphine, justice-clerk benorth Forth (*temp.* Dav. II.), was in 1373 provost, or, as that officer was then called, alderman, of the town of Edinburgh, and in 1382 sheriff of the shire; and in 19 Rob. II., he was keeper of the great seal, in the absence of the chancellor, who had gone abroad.

In the beginning of the fifteenth century, the justice-clerks began also to act as public prosecutors before the justiciars, the latter being previously, it would seem, themselves the prosecutors, as the sheriffs were in their county-courts before the institution of procurators-fiscal; and, in the beginning of the next century, as the office of justiciar came into the hands of a single individual, so likewise did that of justice-clerk. The offices of justice-clerk and king's advocate (an officer of whom we have little account previously to the end of the fifteenth century) appear to have had at this time so many duties in common, that Henryson of Fordel, and Lawson of Hierigs, succeeded each other in them respectively; and the two offices having become vacant by the fall of those individuals at the fatal field of Flodden, Wischeart of Pittarrow was thereupon appointed to both places; but in his time a deputy began to be appointed to officiate as clerk to the Justice Court, Wischeart probably directing his chief attention to his duty as public prosecutor. On his death the offices of justice-clerk and king's advocate were again separated; and to the former Crawfurd of Oxengangs was appointed. On the institution of the present Court of Session, Crawfurd, then justice-clerk, was advanced, as were likewise the king's advocate, treasurer, and clerk-register, upon reasons of public policy; the deliberations of the court being at that time, and till the revolution, in secret with shut doors, agreeably to the practice of the papal tribunals, the principles of which, the court, as may be supposed from its ecclesiastical constitution, had very largely imbibed. The justice-clerk continued in this threefold character of clerk of the Justice Court (but discharging the duties by deputy), lord of Session, and public prosecutor, for some time, when he was at length superseded in the last capacity altogether by the lord-advocate; and in the degree in which he was so superseded he appears to have been appointed an assessor to the lord-justice-general, equally with the other lords of Session. In the time of the excellent Sir Robert Murray, who was appointed to the office in 1651, he began to be styled "lord-justice-clerk." In 1663, Sir John Home was appointed, and, the same year, declared by act of Privy Council a constituent judge of the Justice Court; and in 1672, a statute passed, constituting the lord-justice-clerk vice-president of the court, to preside in absence of the lord-justice-general.

In the Court of Session the justice-clerk had no pre-eminence, till the time of that distinguished lawyer, Miller of Barskimming, who, on his appointment, took his seat by desire of the court, on the right of the lord president; and on the division of the Court of Session into two chambers in 1811, the lord-justice-clerk was made *ex-officio* president of the Second Division, though he is not necessarily a lord of Session. (U. U. U.)

JUSTICES of the Peace, are persons of interest and credit appointed by the king's commission, to keep the peace of the county where they live.

JUSTICIAR, or JUSTICE-GENERAL OF SCOTLAND, officially the chief judge of the supreme criminal court of Scotland, but of old, as in England, the chief justice of the kingdom. The origin of this high office cannot, from the want of records, be traced. There can scarcely be a doubt, however, but that it was derived to us from England after the Norman conquest. The earliest notice we have of it is in the time of Malc. IV.; and then *two* justiciars appear, a justiciar of *Scotland*, and a justiciar of *Lothian*, or the territory subject to the king of Scots south of the Forth. Here, as in England, the justiciar was the king's chief officer, and at the head, not only of the *law* in all its departments, civil, criminal, and maritime, but also of the *military force* of the kingdom, *caput legis et militiæ;* and accordingly we find several instances of the martial prowess, as well as judicial authority, of the justiciar of Scotland in early times, particularly of the valiant justiciaries *Buchan* and *Durward*, in the middle of the thirteenth century. Durward, indeed, during his temporary removal from office, is known to have joined the standard of King Henry III. of England in the French campaign; and Fordun's character of him is more that of a gallant military officer than a sober gownsman.

In 1296, a single justiciar appears for the whole kingdom, in the person of Sir William de Ormesby, a justice of the Common Pleas in England, who was constituted by King Edward I. lord-justiciar of Scotland; but this appointment was of short continuance. In 1305, the English monarch having again put down the Scotch, distributed the kingdom into four districts, and appointed for each district two justices; an arrangement in which the English Justinian had certainly an eye to the judicial system of England, and to the introduction of justices in eyre or of assize, as delegates of the *aula regia*, or justice-deputes, such as were established in that country. The death of Edward, however, soon afterwards put an end to the project; and the old practice of having two justiciars was returned to, and continued till the time of King James IV., but under the designation of a justiciar *north of Forth*, and a justiciar of *Lothian*, or *south of Forth*.

Soon after the fatal battle of Flodden, in the beginning of the sixteenth century, the office of justiciar, or, as he was now styled, justice-general (in contradistinction to the special justices now frequently appointed, as well for particular places as for particular trials), came again into the hands of a single individual, viz. the Earl of Argyll, in which noble family it was hereditary for a century. The High Court of Justiciary, also, began then to be settled at Edinburgh; whereas, before, the parliament and superior courts were held chiefly north of Forth.

Towards the end of the same century, an alteration was made on the manner of going circuit. In the time of King Robert III., the justiciars were each required to pass twice in circuit through every shire of their jurisdiction. But by 1587, cap. 82, instead of passing through the realm from shire to shire successively, the realm was divided into four quarters, and two senators or advocates of the College of Justice were appointed as justice-deputes for each quarter. This system continued about a century, when, by 1672, cap. 16, instead of the former justice-deputes, certain lords of Session were constituted commissioners of Justiciary, along with the justice-general, and the justice-clerk was made vice-president of the court, to preside in absence of the justice-general; an arrangement which has continued to the present day.

The jurisdiction and the powers of the justiciar of England are known to have been distributed amongst the superior courts now existing there. The history of the powers possessed by the justiciar of Scotland we shall now notice. In England the justiciar became a formidable officer, a terror at once to the crown and the people. It does not appear that such was ever the case in Scotland. This no doubt arose much from the early partition of the office into a justiciary north and south of Forth. But his great adversary was the lord-chancellor, as the organ and instrument of the papal clergy, in whose hands the office of chancellor had here, as in the other countries of Europe, long been vested. The high office of justiciar was the envy of the ecclesiastics, always noted for their ambition; but it being forbidden them by the papal constitutions, as a secular tribunal and a place of blood, they could not directly seize upon it as they had done upon the office of chancellor. They therefore set about filching its jurisdiction; and in 1425 the first Court of Session was erected, composed of the chancellor, and with him "certaine discreete persones of the three estates," chosen by the king, with power to judge in all matters competent to the king and his council. In 1503, the Court of Daily Council was instituted instead of the Court of the Session; and at length, in 1532, the present Court of Session and College of Justice was established at Edinburgh, with a jurisdiction in all civil causes. From that time forward, the civil jurisdiction of the justiciar (whose office, it will be remembered, was now hereditary in the family of Argyll, and consequently feeble and inefficient) ceased. And not only so, but its relative importance expired, and the Court of Session became the supreme court of the kingdom; for, by clerical ability, or by lay subserviency not found in England, where the old common law has ever continued the antagonist of Roman jurisprudence, an act passed here (1540, cap. 72), requiring all sheriffs and other temporal judges to copy the proceedings (not of the justiciar, as heretofore, but) of the Court of Session. The triumph of the papal clergy was then complete; the old common law ceased; its records became obsolete, and are to this day of apocryphal authority; and the civil and canon laws became, what they were in use to be denominated, the *common law* of Scotland. And what the Court of Session effected in the civil jurisdiction of the justiciar, the Court of Admiralty did in its maritime jurisdiction. That court was little known before the end of the sixteenth century. About that time Mr Alexander King, advocate, was appointed judge of the Admiralty; and almost immediately, owing to the compilation of his *Treatise on Maritime Law* (perhaps the earliest regular work on that branch of jurisprudence in Britain), the Court of Admiralty rose to importance; and in 1681 it was declared a sovereign judicature, and the high-admiral, the king's lieutenant, and justice-general on the seas. In our own day, however, the High Court of Admiralty has been abolished, and the Court of Justiciary has re-acquired a criminal jurisdiction on the seas. As respects the military power once possessed by the justiciar, that departed from him long ago, and became vested in the army itself, superintended by the crown; yet to this day a recognition of the ancient power may be observed at the Justiciary circuits.

The supreme judicative power of Scotland is therefore now vested in the Courts of Session and Justiciary. The justice-general being now wholly nominal, and a sinecure, the chief judge of Justiciary is the justice-clerk, and the puisne judges are certain lords of Session. The justice-clerk is also president of the Second Division of the Court of Session, though, which is singular, he is not necessarily a lord of Session; and by a late act of parliament, the president of the Court of Session is, on the termination of the existing interest, to assume the office of justice-general. In effect, therefore, though in a very bungling and awkward sort of way the Court of Session will, on the act in question coming into operation, take the place and jurisdiction of the ancient justiciar. (U. U. U.)

JUSTICIARY, or COURT OF JUSTICIARY, in Scotland. See SCOTLAND.

JUSTIFICATION, in *Law*, signifies a maintaining or showing a sufficient reason in court why the defendant did what he is called to answer.

JUSTIFICATION, in *Theology*, that act of grace which renders a man just in the sight of God, and worthy of eternal happiness.

Different sects of Christians hold very different opinions concerning the doctrine of justification; some contending for justification by faith alone, and others for justification by good works.

JUSTIN, commonly called *Justin Martyr*, one of the earliest and most learned writers of the eastern church, was born at Neapoli, the ancient Sechem of Palestine. His father, Priseus, a Gentile Greek, brought him up in his own religion, and had him educated in all the learning of Greece. To complete his studies, he travelled to Egypt, and followed the sect of Plato. But one day walking by the sea side wrapt in contemplation, he was met by a grave person, of a venerable aspect, who, falling into discourse with him, turned the conversation by degrees from the excellence of Platonism to the superior perfection of Christianity, and reasoned so well, as to raise in him an ardent curiosity to inquire into the merits of that religion. The consequence of this inquiry was, that he was converted about the year 132. On his embracing the Christian religion, he quitted neither the profession nor the habit of a philosopher; but a persecution having broken out under Antoninus, he composed an *Apology for the Christians;* and afterwards presented another to the Emperor Marcus Aurelius, in which he vindicated the innocence and holiness of the Christian religion, against Crescens a Cynic philosopher, and other calumniators. He did honour to Christianity by his learning and the purity of his manners; and suffered martyrdom in the year 167. Besides his two Apologies, there are still extant his *Dialogue with Trypho*, a Jew; two treatises addressed to the Gentiles, and one on the unity of God. Other works are also ascribed to him. The best editions of St Justin are those of Robert Stephens, in 1551 and 1571, in Greek and Latin; that of Morell, in Greek and Latin, in 1656; and that of Prudentius Marandus, a learned Benedictine, in 1742, in folio. His works have also been published separately.

JUSTINIAN, the first Roman emperor of his name, and more celebrated for his code of laws than for the military achievements which distinguished his reign, was nephew of Justin I. and succeeded to the imperial purple on the death of his uncle in 527. He began his reign with the character of being a religious prince; and having published severe laws against heretics, and repaired ruined places of worship, he openly declared himself the protector of the church. But whilst thus engaged in re-establishing Christianity at home, he carried his arms against the enemies of the empire abroad, and, through his generals, proved so successful, that he in some measure reinstated it in its ancient glory. By means of Belisarius, the greatest captain of his age, the Persians were conquered, and the Vandals exterminated; Africa was regained; the Goths in Italy were subdued; the Moors were defeated; and the Roman empire was restored almost to its primitive glory. But, in the midst of these successes, the Emperor was endangered by a powerful faction at home; Hypalius, Pompeius, and Probus, nephews of the Emperor Anastasius, the immediate predecessor of Justin, raised an insurrection to dethrone him, and it required all the energy of Belisarius, seconded by Mundus, to put down the rebellion. This, however, was at length effected; the conspiracy was broken, and the ringleaders were capitally punished. The empire being now in the full enjoyment of profound peace and tranquillity, Justinian made the best use of it, by collecting the immense variety and number of the Roman laws into one body. To this end he selected ten of the most able lawyers in the empire, who, having revised the Gregorian, Theodosian, and Hermogenian codes, compiled one body, called *Codex Justinianus*. This may be called the statute law, as consisting of the rescripts of the emperors. But the reduction of the other part was a much more difficult task. It was made up of the decisions of the judges and other magistrates, together with the authoritative opinions of the most eminent lawyers, all which lay scattered, without any order, in no less than two thousand volumes. These were reduced to the number of fifty books; but ten years were spent in the reduction. The design was completed in the year 553, and the name of *Digest* or *Pandects* given to it. Besides these, for the use chiefly of young students in the law, and to facilitate that study, Justinian ordered four books of Institutes to be drawn up, containing an abstract or abridgment of the text of all the laws; and, lastly, the laws of a date posterior to that of the former were, in the year 541, thrown into one volume, called the *Novellæ*, or New Constitutions. See Civil Law.

This transaction has immortalised the name of Justinian, who, in other respects, was neither a great nor a good man, and whose name was held in abhorrence by the people, partly on account of his rash and inconsiderate conduct in ecclesiastical matters, but still more by reason of the heavy burdens which he imposed on them. He died suddenly in 565, after a reign of thirty-nine years, at the advanced age of eighty-three. Justinian built a great number of churches, particularly the famous St Sophia at Constantinople, which is esteemed a masterpiece of architectural design.

JUSTINIANI, St Laurence, the first patriarch of Venice, descended of a noble family, was born there in the year 1381. He died in 1485, leaving several religious works, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. He was beatified by Clement VII. in 1524, and canonized by Alexander VIII. in 1690.

Justiniani, *Augustin*, bishop of Nebbio, one of the most learned men of his time, was descended from a branch of the same noble family with the preceding, and born at Genoa in 1480. He assisted at the fifth council of Lateran, where he opposed some articles of the concordat between France and the court of Rome. Francis I. made him his almoner; and he was for five years regius professor of Hebrew at Paris. He returned to Genoa in 1522, where he discharged all the duties of a good prelate; whilst learning and piety flourished in his diocese. He perished at sea in his passage from Genoa to Nebbio, in 1536. He composed several pieces, the most considerable of which is *Psalterium Hebræum, Græcum, Arabicum, et Chaldaicum, cum tribus Latinis interpretationibus et glossis.* This was the first psalter of the kind printed. There is also ascribed to this prelate a translation of Maimonides's *More Nevochim.*

JUSTINUS, a Latin historian, whose name appears in some manuscripts as M. Junianus Justinus, and in others, Justinus Frontinus. We are unable to fix with precision the period during which he flourished, though some have placed him in the reign of Antoninus, A. D. 160, from the name of that emperor being found in the dedication according to some manuscripts, though it is doubted whether this dedication be genuine. Of his private history we know nothing. Justin abridged the history of Trogus Pompeius, who wrote in the reign of Augustus. Its title runs thus: *Historiarum Philippicarum, et totius mundi originum et terræ situs ex Trogo Pompeio excerptarum, libri xliv. a Nino ad Cæsarem Augustum.* The first six books may be considered as an introduction to the history of Macedonia, which is found in books vii. viii. ix. xi.—xvii. xxiv.—xxvi. xxviii.—xxx. xxxiii. Justin tells us that he omitted every thing which he considered as either unnecessary or likely to be displeasing to the reader, and in this way he has passed over all the geograpical information of Trogus. He is particularly deficient in chronological arrangement, though his style is in general simple and correct. The Prologi which are found attached to each book were not written by Justin, but by some old grammarian. Editio princeps, Venet. 1470, per Jenson, and Rome, 1470, 1471. It has often been published along with Florus: Mediol. 1476; ed. Bongarsius, Par. 1581; ed. Lemaire, Par. 1823; e recen. Gron. et cum var. not. ed. Frotscher, Lips. 1827, 3 vols.

JUSTNESS, the exactness or regularity of any thing. Justness is chiefly used in speaking of thought, language, and sentiments. The justness of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject. Justness of language consists in using proper and well-chosen terms; in not saying either too much or too little.

JUTERBOCK, a city of the circle of that name, in the Prussian province of Brandenburg, on the river Elbe, containing 569 houses, and 3394 inhabitants, employed in making cloth, leather, shoes, and linen goods.

JUTLAND, a large peninsula, which makes the principal part of the kingdom of Denmark. See DENMARK.

JUVENALIS, DECIMUS or DECIUS JUNIUS, a celebrated Roman satirist, respecting whose personal history only a few scanty notices have been preserved, chiefly in a life of the poet usually ascribed to Suetonius. Juvenal was a native of Aquinum, now Aquino, a city of Latium, on the Via Latina, a few miles from the left bank of the Liris; but whether he was the son of a freeman by birth or by adoption, is a point which cannot now be decided. Neither is the exact date of his birth or death known, though it seems most consonant to the other facts stated respecting him, to conclude that he must have been born about A. D. 42, in the reign of the Emperor Claudius. Some have believed him to have been the pupil of Quintilian, and Fronto, the preceptor of the two Antonines; but the time during which they flourished disproves this supposition. Juvenal seems to have pursued in his early years the study of rhetoric with much ardour, more as a recreation than with the view of employing it in the practical affairs of the forum; and it was not until he was far advanced in years that his genius for poetry fully developed itself. It is said that a passage in one of his Satires (vii. 87–92), which lashes with an unsparing hand the court of Domitian, was thought by the favourite of the day to aim indirectly at the conduct of Hadrian; and the emperor marked his displeasure by banishment from Rome to the most remote district of Egypt, though under the pretext of an appointment as *præfectus cohortis.* He had now reached his eightieth year, A. D. 121, and his age was not suited to bear a change of climate or the fatigues of a camp. He is said to have died in Egypt, though some make him return to Italy.

Of the works of Juvenal we possess a collection of sixteen satires, divided by grammarians into five books. The last satire is considered by some as not being the production of Juvenal. They were not written and published in the same order in which we now possess them. The character of the Satires of Juvenal is very different from that of the Satires of Horace. Whilst Horace laughs in a good-natured tone at the follies of mankind, Juvenal pursues their crimes with all the unmitigated bitterness of scorn. The picture which he at times presents is so hideous, that the mind revolts at its contemplation; and it is impossible not to believe but the same effect might have been produced if the poet had been somewhat less minute in his details. The corruption of manners which had at this time pervaded every class of the Romans, was certainly of the most revolting kind, and supplied ample materials for the pen of the satirist. Yet there is an exaggerated tone, and an air of rhetorical declamation, throughout his satires, which lessen greatly their effect. This is also the fault to be found with all the writings of his age, produced evidently by a desire of astonishing the imagination with bold and novel descriptions. The first edition of Juvenal was probably that published along with Persius, at Rome, 1470. The best is that of Ruperti, Lips. 1801, which has often been reprinted. It has been translated into English by Holyday, Oxf. 1616, 1673; by Stapleton, six Satires, Oxf. 1644; by Dryden, Lond. 1697; by Owen, Lond. 1785; and by Madan, Lond. 1789. The best translation into French is said to be that of Dusaulx, Paris, 1770, 1816, 5th ed., or of Raoul-Rochette, Paris, 1812.

JUVENCUS, CAIUS VECTICUS AQUILINUS, one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put the life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed closely the text of the evangelists; but his verses are written in bad taste and in worse Latin.

JUVENTAS, in *Mythology*, the goddess who presided over youth amongst the Romans. This goddess was long honoured in the capitol, where Servius Tullius erected a statue to her. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proserpine. The Greeks called the goddess of youth Hebe; but it has been generally supposed that this was not the same with the Roman Juventas.

JUXON, DR WILLIAM, archbishop of Canterbury, was born at Chichester in 1582. He was educated at Merchant Tailors' School, and thence elected into St John's College, Oxford, of which he became president. King Charles I. made him bishop of London, and in 1635 promoted him to the office of lord high treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved so well in the administration, that he soon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when he prudently resigned the staff, to avoid the storm which then threatened the court and the clergy. In the following February an act passed, depriving the bishops of their votes in parliament, and incapacitating them from exercising any temporal jurisdiction. In these leading steps, as well as in the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as a bishop nor as a treasurer was a single accusation brought against him in the long parliament. During the civil wars he resided at his palace at Fulham, where his meek, inoffensive, and affable manners, notwithstanding his remaining steady in his loyalty to the king, procured him the visits of the principal persons of the opposite party, and respect from all. In 1648 he attended his majesty at the treaty in the Isle of Wight; and, by his particular desire, waited upon him at Cotton House, Westminster, the day after the commencement of his trial, during which he frequently visited him in the office of a spiritual father; and his majesty declared he was the greatest comfort to him in that afflicting situation. He likewise attended his majesty on the scaffold, where the king, taking off his cloak and george, gave him the latter. After the execution, Bishop Juxon took care of the body, which he accompanied to the royal chapel at Windsor, and stood ready, with the common-prayer book in his hands, to perform the last ceremony for the king; but he was prevented by Colonel Whichcot, governor of the castle. He continued in the quiet possession of Fulham Palace till the ensuing year, 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy till the restoration, when he was presented to the see of Canterbury; and, during the little time he enjoyed it, expended, in buildings and reparations at Lambeth Palace and Croydon House, near L.15,000. He died in 1663, having bequeathed L.7000 to St John's College, and to other charitable uses near L.5000. He published a sermon on Luke, xviii. 31, and Some Considerations upon the Act of Uniformity.

K.

K, the tenth letter, and seventh consonant, of our alphabet, being formed by a guttural expression of the breath through the mouth, together with a depression of the lower jaw, and an opening of the teeth. Its sound is much the same with that of the hard *c*, or *qu*, and it is used for the most part only before *e*, *i*, and *n*, in the beginning of words, as *ken*, *kill*, *know*, and the like. It used formerly to be always joined with *c* at the end of words, but is at present very properly omitted, at least in words derived from the Latin. Thus, for *publick*, *musick*, we now say *public*, *music*, and so on. However, in monosyllables it is still retained, as *jack*, *block*, *mock*, and the like.

K was borrowed from the Greek *kappa*, and was but little used amongst the Latins. Priscian looked on it as a superfluous letter, and says that it was never to be used except in words borrowed from the Greek. Dausquius, after Sallust, observes that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word *kalendæ*, where it sometimes stands instead of *c*. Carthage, however, is frequently spelt on medals with a K, SALVIS AUG. ET CAES. FEL. KART.; and sometimes the letter K alone stood for *Carthage*. M. Berger has observed, that a capital K, on the reverse of the medals of the emperors of Constantinople, signified *Konstantinus;* and that on the Greek medals it signified ΚΟΙΛΗ ΣΥΡΙΑ, *Cœle-Syria*. Quintilian tells us, that in his time, some people had a mistaken notion, that wherever the letters *c* and *a* occurred at the beginning of a word, *k* ought to be used instead of the *c*. Lipsius observes, that K was a stigma anciently marked on the foreheads of criminals with a red-hot iron.

The letter K has various significations in old charters and diplomas; for instance, KR. stood for *chorus;* KR. C. for *cara civitas;* KRM. for *carmen;* KR. AM. N. for *carus amicus noster;* KS. *chaos;* KT. *capite tonsus*, &c. The French never use the letter *k* excepting in a few terms of art and proper names borrowed from other languages. Ablancourt, in his dialogue of the letters, introduces K as complaining that he has been often in a fair way of being banished from the French alphabet, and confined to the countries of the north.

K is also a numeral letter, signifying 250, according to the verse,

> K quoque ducentos et quinquaginta tenebit.

When it had a stroke above it, $\bar{K}$, this letter stood for 250,000. K on the French coinage denotes money coined at Bordeaux.

KAARTA, one of the many kingdoms into which the western part of Africa is divided, and of which little or nothing is known, excepting that it is of considerable extent, but, from the arenaceous nature of the soil, very scanty in all vegetable productions, with the exception of the lotus. The capital is called Kemmoo; but the king has, besides, two strong fortresses, Joko and Gedingooma, to which he can flee for security when his dominions are invaded by the forces of the neighbouring states. Kasson, formerly an independent country, is now incorporated with Kaarta. It is about fifty miles from north to south, and nearly the same from east to west; but, though small, it is well peopled, and is a beautiful and fertile country. Kasson is likewise considered as rich in gold, silver, and coffee. The capital is called Kooniakary. The commerce of the states in this quarter consists in exchanging gold, ivory, and slaves, for European goods.

KABANIA, a fortress of Asiatic Russia, being part of the line formed for the defence of the government of Tobolsk. There are seventy-five houses without the fort. It is 270 miles south of Tobolsk.

KABANOUA, or KABANOUSKA, a fortress of Asiatic Russia, in the government of Tomsk, for protecting the frontier against the Kirghises. It is eighty-six miles south of Tomsk.

KABARDA, a territory of Asia, in the Russian government of Caucasus, inhabited by the principal of those nations known under the name of Circassians. The Terek, along the southern bank of which it extends, separates it from the Russian government of Caucasus. It is divided into the Great and Little Kabarda, the frontier of which reaches from the shore of the Caspian to the river Malka, whilst the latter extends thence to the environs of the city of Mosdok. They are both subject to Russia, but they are governed internally by their own princes.

KABOUR, a river of Asia, in the pashalik of Bagdad, which rises near Merdin, and pursues a southerly course, until it receives the Mygdonius, when it enters the Euphrates at Kerkesia, the ancient Circessium.

KABRONANG, an island in the Eastern Seas, about eighteen miles in circumference. It is in a high state of cultivation, and may be seen about eighteen leagues off, being distinguished by a high-peaked hill about the middle. It is separated from Salibabo island, which lies to the north-west, by a strait about four miles wide. Long. 126. 35. E. Lat. 3. 50. N.

KACHTAN, or CACHTAN, a small district of Yemen, in Arabia, situated in a mountainous district, about six days' journey north-north-east from Saade.

KADESH, KADESH-BARNEA, or EN-MISHPAT, in *Ancient Geography*, a city celebrated for several remarkable events. At Kadesh, Miriam the sister of Moses died; and here it was that Moses and Aaron, showing a distrust in God's power, when they smote the rock at the waters of strife, were condemned to die without the consolation of entering the promised land. The king of Kadesh was one of the princes killed by Joshua. This city was given to the tribe of Judah, and was situated about eight leagues to the south of Hebron.

KADIRGUNGE, a town of Hindustan, in the province of Agra, and district of Furruckabad, surrounded by a mud wall. It is situated near the south-west bank of the Ganges, and forty-three miles north-north-west from Furruckabad. Long. 79. 2. E. Lat. 27. 50. N.

KADMONÆI, or CADMONÆI, in *Ancient Geography*, a people of Palestine, said to have dwelt at the foot of Mount Hermon, which lies to the eastward, and is the reason of the appellation, with respect to Libanus, Phœnicia, and the northern parts of Palestine. They were also called *Hevæi*.

KADOM, a city of European Russia, in the province of Tambow. It is situated in a woody district, mostly inhabited by Tartars. The population amounts to 5100 persons.

Much wax and honey is collected in the neighbourhood. It is 230 miles east-south-east from Moscow.

KAFFA, a city of the Russian empire, in Europe, in the Crimea. It was formerly the capital of that peninsula, and the residence of the khan; and, from the end of the thirteenth till the middle of the fifteenth century, it maintained, by its flourishing trade, which was chiefly with Genoa, a population of 100,000. It was taken by the Turks in 1474, since which time its trade has vastly declined. It was taken by the Russians in 1770, and given back again to the khan in 1774. But it was, with the whole of the Crimea, given up to Russia in 1783, which cession was confirmed by the treaty of 1792, concluded at Jassy, between Turkey and Russia. It stands on a bay of the Black Sea, on the side of a hill. It was declared a free port by the Russians in 1798. It is the seat of the provincial government, has some trade in the products of the soil of the peninsula, and contains 5000 inhabitants. There is a Greek theatre, a botanic garden, and a museum of antiquities, established in the neighbourhood. It is sometimes called by the Russians Feodosia.

KAFFILAR KOOK, a village of Persia, surrounded by a range of high mountains of the same name, on the road from Sultania to Sennah, and seventy miles north-north-east of the latter place.

KAFFRARIA, Kafferland, or Caffraria, a territory extending along the eastern shores of South Africa, from the eastern boundary line of the Cape of Good Hope to Delagoa Bay, a distance of between 600 and 700 miles. It extends inwards to the country of the Boshuanas, between 200 and 300 miles from the sea; but this frontier has never been properly explored, and consequently cannot be correctly defined. To this coast the Portuguese gave the name of Natal, which has been followed by navigators, but is of course not in use amongst the natives as a designation of their territory. Of this region of the globe, either as regards its physical aspect or natural productions, little is known, and that little is confined to isolated parts, and not to the country as a whole. In some portions of it sandy plains spread out in unfruitful barrenness for many miles; but others are exceedingly fertile, consisting of fine savannahs, intersected with small clumps of trees, and carpeted with a rich variety of herbaceous plants, whilst excellent streamlets, meandering amongst the shrubbery in the centre of the valleys, give life and beauty to the landscape. These are chiefly to be met with at the base of a chain of high mountains stretching into the vicinity of Delagoa Bay. The ridge was recently crossed by one of the missionaries resident in this quarter, who says, that on reaching the summit, fine grassy plains, thickly inhabited, were seen spreading out in every direction, it being the summer residence and grazing-place of those clans who live along the base of the mountain. The pasturage was good and abundant, the climate remarkably fine, and the general aspect of the country, the trees, and shrubs, and other features, strikingly resembled those in many parts of England, whilst the whole appeared watered by numerous rills. The mountainous range which divides the sea-border from the interior is in some parts 6000 feet in height; and the most distinguishing geological feature which they possess is the presence of a superincumbent stratum of sandstone. High detached masses are found in many places standing some feet above the surface of the earth. The upper part of a mountain visited by the individual alluded to, presented to the eye immense precipices capped with large rhomboidal tables, and projecting angles forming a sort of cornice to the face. On the side of the declivities there was a description of prismatic quartz crystals in a corroded state, and evidently undergoing the process of decomposition; a circumstance which is observable in all the mountains of South Africa, and will no doubt yearly give rise to an increasing extent of soil. Iron-stone is everywhere found in Kaffraria, and also considerable quantities of ochre of various kinds, presenting itself under different circumstances. The coast of Natal has been described by one of the most recent authorities as looking like a large park, varied with hill and dale, displaying occasionally through a luxuriant valley the distant prospect of blue mountainous ridges. On other parts of the coast the landscape was equally beautiful; clusters of trees, hills, vales, and glens composing the foreground, whilst in the distance, divided by a deep valley or chasm, a range of craggy mountains extended in a parallel direction to the limits of vision. There are a great many rivers on the Kaffraria coast, of which the Kaï or Ky, and Keiskamma, are amongst the largest. The entrance of the former is one of the most picturesque and extraordinary in the world, as it forms, by its abrupt and perpendicular heights, a natural lock, "wanting only a flood-gate to make it a wet dock." That part of the coast where Port Natal is situated possesses so many advantages, that proposals have been lately made to the British government to have it regularly settled. The memorial of the merchants and other inhabitants of the Cape of Good Hope embodies various reasons for laying the case before the "king in council;" and as it likewise conveys a description of the country, we shall give an abstract from it.

The arguments brought forward are, that the country in the vicinity of Port Natal was originally purchased by the Dutch, and held by them as a dependency of the Cape of Good Hope, and, of course, along with the latter colony, was ceded to Great Britain in 1814; that since the year 1824, Port Natal has been almost constantly occupied by British subjects, by permission of the governor of Cape Colony; that these persons had succeeded in opening a trade with the natives, which has gradually increased in extent, from the encouragement offered by the Zoolas, who are favourable to Europeans, but whose residence there is attended with great risk in the absence of a government establishment, which would be a protection to the trader, and likewise prevent the frequent collision of the Zoola and Kaffre tribes. The pastures of the country between these tribes are of a highly favourable description. It is well wooded with large timber, and watered by upwards of one hundred rivers and running streams, some of which are larger than the chief rivers of Cape Colony. The soil is fertile, and has produced three crops of Kaffre and Indian corn in the year. The rains are periodical, and the climate is cooler than that of the Cape, and highly salubrious. The bay of Port Natal is an exceedingly fine harbour, but the entrance is narrow, and has a bar of shifting sand. There are six feet of water on the bar, with a run of six feet, and at spring-tides the depth is fourteen. "There are a considerable number of natives, a laborious and well-conducted people, who are the remains of the tribes who formerly occupied the country purchased and ceded by the Dutch, and who, having attached themselves to the white inhabitants, are living in its vicinity under their auspices, unmolested by the Zoolas." The memorial goes on to state, that such an establishment as that contemplated would prevent the irregular trading which is carried on at Port Natal, and advance the civilization and moral improvement of the neighbouring tribes, besides protecting the Kaffres. The ceded territory is said to extend about two hundred miles along the coast to the westward, and one hundred miles inland; and, from the capabilities of the country for maintaining a large population, and carrying on an extensive trade, a comparatively small military force is all that is required.

The name Kaffre (in Arabic Kafir, signifying an unbeliever or pagan) was given by the early Portuguese navigators to the natives of the entire eastern coast of Africa. The

Kaffraria. Dutch settlers at the Cape, therefore, when, in their migrations eastward, they discovered a race of men entirely different from the Hottentots, called them Kaffres. This name, in its most extensive application, designates several African tribes, who are again distinguished by other appellations; and colonial usage has almost appropriated the generic term Kaffre to the tribe in closest contact with the colony, and who call themselves Amakósa. Their northern neighbours are called the Amatêmbu, which the Dutch have metamorphosed into Tembooger, and the English into Tambookies. Farther east is located the Amaponda or Amambo, which has been corrupted into Mambookies. The latter are the most industrious of the three nations, but the Amakósa are considered the most warlike. Still farther to the east of the Amaponda are the Zoolas, to whom reference has already been made. The descent of these races of men has been attributed to the Bedouins or wandering Arabs; and this conjecture is by no means improbable, for they are distinct from both negroes and Hottentots; whilst the people above mentioned, having penetrated into every part of Southern Africa, may have reached this country by skirting the Red Sea, and journeying southward by the sea-coast, so as to avoid the great desert of sand by which Africa is divided into two parts. Their character, manners, modes of building, and other circumstances, also favour the assumption. The middle of the seventeenth century has been assumed as the period when they first acquired territory here from the native tribes. The Amakósa Kaffres have been frequently described by individuals who have visited their country. Their features are Asiatic, their physical endowments considerable, and their intellectual qualities respectable, although, from their remaining still in an uncivilized, and almost entirely savage state, the latter have not had a fair opportunity of developing themselves. But we shall recur to the subject of their character and future prospects at the close of this article.

One of the principal articles of trade amongst the Kaffres is the barter of cattle for young women of the Tambookie tribe, who are short, stout, and muscular; and these are preferred by the chiefs to females of their own people. In the warm season a thin apron constitutes their sole bodily attire; but in winter a cloak is used, made of the skins of wild beasts, admirably curried. The head, even in the hottest weather, is never protected by any covering; and they seldom use shoes, except on undertaking a long journey, when they condescend to wear a rude substitute for them. The bodies of both sexes are tatooed; and those of the young men who correspond to the fops of more civilized nations paint their skins and curl their hair. Their arms are the javelin, a large shield of buffalo hide, and a short club. The women exhibit taste in the arrangement of their dress, particularly for the head, which consists of a turban made of skin, and profusely ornamented with beads. A mantle of skin, variously bedecked with beads and other showy trinkets, is worn; and the only distinction between the dress of the chieftain's wives and those of the lower ranks consists in the greater profusion of ornaments possessed by the former, but of which all are alike vain. There is no change, the whole wardrobe of the female being that which she carries about with her, and sleeps in; for bed-clothes they have none. Their huts are generally about twelve feet diameter, with a raised floor, and a gutter for a drain. They are constructed by setting up poles erect, then bending the tops till they meet, when they are tied together with fibres. This skeleton of a dwelling is then thatched outside with rushes, and plastered inside with clay or cow dung. Little time is spent in these primitive abodes, for the excellence of the climate admits of the people living much in the open air. The Kaffre hamlet generally consists of about a dozen of such huts; and the sites of these, as well as the cattle folds, are chosen with reference to the pasturage ground, as the safety and multiplication of their flocks is the chief care of these modern Arcadians. Horses have lately been brought amongst them, previous to the introduction of which the ox was their only beast of burden. Sheep and goats have greatly multiplied with them.

The grain which they chiefly cultivate is a kind of millet, *holcus sorgium;* a small quantity of Indian corn, and some pumpkins, are likewise grown; but a species of sugar-cane called mifi is produced in great abundance, and of this they are extremely fond. Their diet, however, is chiefly milk in a sour, curdled state. They abhor swine's flesh, keep no poultry, are averse to fish, but indulge in eating the flesh of their cattle, which they prepare in a very disgusting manner. They are nearly strangers to spirituous liquors, but have as substitutes a kind of mead, and a tolerably good beer prepared from malted millet. Although naturally brave and warlike, they prefer an indolent, pastoral life, hunting being an occasional pastime. They are excellent herdsmen, and extremely expert in the management of their oxen, which they train to obey with perfect docility the will of their masters. They are carefully sheltered and secured in pens, and milked morning and evening in their folds. The hides are made into garments by the men, who also exhibit some dexterity as artisans in fashioning weapons, axes, and the like. The women, however, officiate as the architects of the dwellings; and they also weave a superior sort of mat from a fine rush, which displays some taste in the execution. Their whole household utensils consist of a sleeping mat, a leathern milk sack, a calibash, and an earthen pot for cooking.

Their form of government is that of hereditary chieftains, or clansmen. The chiefs are legislators as well as judges, but the old men of the tribe assemble on necessary occasions, forming a sort of jury, and they have also a voice in decisions, which are generally founded on precedents, orally and faithfully transmitted from sire to son. Their laws are few and simple. The courts, which all have the privilege of attending, are held in the open air, and each party to a suit pleads his own cause. In their religion, although no regular system of idolatry exists amongst them, they are addicted to sorcery, spells, and charms. They reverence a Supreme Being, and believe in the immortality of the soul, yet never associate with it the idea of future rewards and punishments. With the exception of a few unimportant matters connected with the burying of the dead, their religious or solemn ceremonies present nothing worthy of particular notice.

Much light has recently been thrown on the present condition and future prospects of this people, by papers relative to the Cape of Good Hope, which were laid before government in 1835. From these it appears that a system of aggression, and an unjustifiable appropriation, on the part of the whites, have from time to time roused the savage energies of the Kaffres, and impelled them to make severe reprisals on their European spoilers. The longing of the colonists for the well-watered valleys of the Kaffres, and of the latter for the colonial cattle, which are much superior to their own, still are, as they have always been, the sources of irritation. The Dutch boors, an unscrupulous race of men, seem from time to time to have treated the aboriginal population very unceremoniously. In the year 1834, matters arrived at a crisis. A portion of land on the western side of the Keiskamma had, for many years, been occupied by the herds of the Kaffres, by permission of the colonial government. This indulgence was said to have been abused, and the immediate expulsion of the transgressors took place. This happened in November 1833. The Kaffres retaliated, and, at the close of 1834, the depredations in the colony had reached an alarming height. The savages poured into the colony in great numbers, wasted the farms, drove off the cattle, and murdered not a few of the inhabitants. An army of 4000 men was marched against the invaders, who were driven far beyond the boundary line which formerly separated Kafferland from Cape Colony, and not only forced them to confine themselves within the new limits prescribed, but to pay a heavy fine. Treaties have been entered into between some of the native chiefs and the colonial government, by which the river Ky is constituted the boundary of the colony; an arrangement which deprives the Amatêmbu people, who did no harm, of their independence. Tracts of country have been assigned to the Kaffre chiefs of several families, who acknowledge themselves to be subjects of Great Britain, and who are to pay a fat ox annually as a quit-rent for the lands which they occupy. They are now, so far at least, brought within the pale of the English government; but how the plan will succeed is still a matter of uncertainty and speculation. (For further particulars on this subject, see *Edinburgh Review*, vol. lxiii.)

KAHLORE, a Sikh town of Hindustan, in the province of Lahore, situated on the banks of the Sutlege, above Macowall, and near the mountains through which that river enters Hindustan. There is also a town of this name situated at a short distance north-east from the city of Lahore.

KAIBALLS, a people of Asiatic Russia, who reside near the source of the Yenesei. They appear to be an intermixture of the Samoyeds with the Tartar race.

KAINSI, the Hottentot name of a species of antelope, denominated by the Dutch, on account of its agility, *klip-springer.* It is of a yellowish-gray colour, and of the size of a kid of a year old.

KAINSKE, a small fortified town of Asiatic Russia, in the government of Tomsk, situated on a small river of the same name. It is placed as a defence to the Tartars of the steppe of Barabinsk, against the incursions of the Kalmucks and Kirghises.

KAIR, a large fortified town of Hindustan, in the province of Aurungabad, situated on the south bank of the Godavery.

KAIRWAN, a city of Africa, in the province of Tunis, the first seat of Saracenic empire in Barbary, and still ranking second only to Tunis in trade and population. It is a walled town, situated in a barren sandy plain, and dependent for its supply of water upon a capacious reservoir, filled by the rains, and a pond which becomes nearly dry in summer, when it exhales a noxious effluvium. The situation is undoubtedly ill chosen, yet it appears to occupy an ancient site, and it derives importance from its situation. Shaw, in his *Travels*, gives the following account of it. "We have at Kairwan several fragments of ancient architecture; and the great mosque, which is accounted to be the most magnificent, as well as the most sacred, in Barbary, is supported by an almost incredible number of pillars. The inhabitants told me (for a Christian is not permitted in Barbary to enter the mosques) that there are no fewer than five hundred. Yet among the great variety of columns, and other ancient materials, that were employed in this large and beautiful structure, I could not be informed of one single inscription." The name which it bears seems to be the same with *caravan*, and might therefore originally designate the place where the Arabs had their principal station in subduing this portion of Africa. It was founded by Hucba or Akbar, in the fiftieth year of the hejira, "under the modest title," says Gibbon, "of the station of a caravan." The population is said to amount to above 50,000. Long. 9. 57. E. Lat. 35. 36. N.

KAISERSLAUTERN, a city of Bavaria, the capital of the district of the same name, in the province of the Rhine. The district extends over 706 square miles, and contains 98,400 inhabitants. It is in a mountainous country, filled with mines, and a great part covered with woods. The city is situated on the river Lauter, and is surrounded with walls, containing three churches, 380 houses, and 2810 inhabitants. There are manufactories of cotton goods and hosiery, and several blast-furnaces. It is remarkable for three battles fought there between the Prussians and the French, one in 1793, the other two in 1794. Long. 7. 41. E. Lat. 49. 26. N.

KAJAAGA, or GALAM, a kingdom of Western Africa, extending from within a few miles of the Cataract of Feloo in the east (where it is bounded by Kasson), about forty miles west of the Falume, to the north of Geereer Creek, which divides it from Foota. On the south it is bounded by Bondoo. The most complete description of this country is that contained in Major Gray's *Travels in Africa*, who visited it in 1819. At that time Kajaaga was composed of a series of towns situated on either bank of the river Senegal. It formerly extended several miles in the direction of Bondoo, Foota, and Bambouk, but had shrunk into its present dimensions in consequence of the encroachments of the neighbouring tribes, with whom a war was kept up, and who were enabled to carry it on more successfully from disagreements amongst the various branches of the royal family. The river Fa-lemmê (which signifies "small river") divides it into Upper and Lower Kajaaga. The former is governed by the Tonca of Maghana, and the latter by the Tonca of Tuabo. These towns constitute the capitals of the respective divisions, but neither acknowledge the supremacy of the other, although previously and of right it belonged to the former, near which is situated Fort St Joseph, now deserted and in ruins. This was the point at which the French attempted to carry on the commerce of the Upper Senegal, and a voyage thither was calculated to realize cent. per cent.; but the unhealthiness of the climate, the difficulties of the navigation, and the constant hazard of being plundered by a succession of barbarous chiefs, who occupy the banks, render it a very precarious speculation. The Serawoollies, who are located in this quarter, rank amongst the most industrious of the African tribes, and have engrossed the trade of Bambouk, Manding, and most of the upper districts of the Senegal as well as the Niger.

The face of the country is very mountainous, and covered to a considerable extent with wood, a large portion of which is well adapted to common uses. The vegetable productions, like those of Bondoo, are corn of four different kinds, together with rice, pumpions, water melons, gourds, sorrell, onions, tobacco, red pepper, pistachios, cotton, and indigo. Numbers of tamarinds, baobabs, rhamnus lotus, and other fruit-trees, are likewise scattered about the beautiful and picturesque valleys. This country differs from Bondoo only in its proximity to the river, and in its partial inundation during the rains. The commerce consists in the exchange of the cotton cloths manufactured in the country, and the superabundance of their provisions, for European merchandise, such as fire-arms, gunpowder, India goods, hardware, amber, coral, and glass beads. These are again exchanged with their neighbours of Kaarta, Kasson, and Bambouk, for gold, ivory, and slaves, who are in their turn sold to vessels from Senegal. The manufactures of Kajaaga are nearly similar to those of the neighbouring kingdoms, consisting of wearing apparel, household furniture, together with implements of husbandry, carpenters', blacksmiths', and leather-workers' tools, and knives, spear and arrow heads, bridle-bits, stirrups, and a variety of other small articles. But they have an advantage over their neighbours in some respects, particularly in the weaving and dyeing of cotton; "and," Major Gray observes, "whether it be that the humidity of the soil on the banks of the river is more congenial to the growth of the cotton and indigo, or that the manufacturers are more expert, I cannot say; but certain it is, that they can dye a much finer blue than I have before seen in Africa." The dress of the people is far from being inelegant or inconvenient. The men wear on the head a white cotton cap, very neatly worked with different coloured silks or worsteds; whilst a shirt of white cotton, with short sleeves, worn next the skin, covers the body from the neck to about the thigh, and is surmounted by a very large one of the same materials, descending below the knees, as do also the small clothes, which are very roomy above, and generally of a blue colour. They wear their hair cut close; and the cap, which is always white, is of a very graceful form, and embroidered. The dress of the women, who are extremely neat in their persons, is handsome; and they are very fond of such ornaments as amber, coral, and glass beads of different colours, wherewith they bedeck different parts of their bodies. In their living they are proverbially fond of animal food; indeed a putrid hippopotamus floating down the Senegal is considered as a prize, the division of which, when dragged to shore, sometimes occasions strife amongst the captors. From a state of paganism, these people are gradually veering round to the tenets of Mahommed. Some towns are wholly inhabited by priests, who are by far the most wealthy and respectable members of the community. There is a mosque in every town, and the times of worship are strictly attended to by the priests and their disciples. Great numbers of dates are grown in all the towns, which are beautifully shaded with large trees of the fig and other kinds of timber; and being well walled, present a more respectable appearance than might be expected amongst a people whose means are so limited. In their persons they are rather robust, and of a grave and sober deportment. Their colour is a jet black, which they are at much pains to preserve, by profusely anointing their bodies with rancid butter. They are considered as more friendly to Europeans than any other of the surrounding tribes, probably from the long existence of a state of commercial intercourse between them and the inhabitants of Senegal, with whom they claim relationship, and towards whom they show much attachment. The advantages which they derive from their local situation render them enemies to the people of Bondoo, who have nothing to do with the river except through the medium of the Kajaaga country. Hence the exertions which have been made by Bondoo to subjugate the nations, and kindle up intestine warfare between the inhabitants of the upper and lower states; and this to a certain extent they have succeeded in effecting. But with these barbarous races of men, amongst whom war is a regular trade, and moral restraint can be but imperfectly recognised, there is such a continual fluctuation of affairs, that it is hazardous to assign limits to the territory which they possess, or to say what the form of government is at any given time; for the predatory inroad of a neighbouring foe may totally alter both in the course of a single day. According to Major Gray's account, the succession to the crown is not hereditary, but descends in a regular line to the eldest branch of a numerous race called Batcheries, who are the undisputed chiefs of the country. The population was considerably increased by an influx of inhabitants from the north bank of the river, who were obliged to quit their own country on account of the exorbitant demands of the Kaartans, to whom they paid tribute. But what the total amount may at present be it is impossible to form a conjecture.

KAKETI, the most easterly and mountainous province of Georgia, in Asia, the surface of which is covered with the ruins of fortresses, villages, and towns, owing to the numerous wars, both foreign and domestic, to which it has been exposed. It is now subject to the dominion of Russia, having been formerly governed by its own princes. Some degree of order has been restored under the rigorous rule of Russia, and both commerce and population are extending.

KAKKABBAN, an island in the Eastern Seas, and one of the cluster called Maratuba, forty miles from the east coast of Borneo. Long. 116. 40. E. Lat. 2. 8. N.

KAKORH, a large town of Hindustan, in the province of Ajmeer, situated at the southern extremity of a range of hills.

KAKREZE, a district of Hindustan, in the province of Gujerat, which consists of eighty-four villages, belonging to several Hindu chiefs. Its principal towns are Therah and Oon, at the latter of which the district commences. Kakreze is fifteen miles to the north of Rahdunpoor.

KALAMATA, a town of Greece, in the Morea, the capital of a circle of the same name. It stands at the mouth of the river Pirnascha, on the Gulf of Koron, and contains 2500 inhabitants, partly employed in the fishery, and in cultivating olives.

KALASIN, a city of the province of Twer, in Russia, the capital of a circle of its own name, which contains one city, 650 villages, and 64,210 inhabitants. The city stands at the mouth of the Chabna, where that river falls into the Volga. It contains 640 houses, and 3820 inhabitants. Long. 38. 38. E. Lat. 57. 20. N.

KALATIGAS, a small river of the island of Java, near its eastern extremity. It is the termination of the fine military road made by order of General Daendels, the French governor, and which extends in length from Batavia 684 miles.

KALATOA ISLE, an island in the Eastern Seas, about thirty miles in circumference, surrounded by a cluster of other islands or rocks, on which the English ship the Ocean was lost in 1797. Long. 122. 15. E. Lat. 7. 18. S.

KALBE, a city, the chief place of a circle of the same name, in the province of Saxony, in Prussia, and situated on the river Saale. It is celebrated for its manufactures of friezes, flannels, and hosiery. It is fortified, and contains 781 houses, with 4427 inhabitants. Long. 11. 39. 1. E. Lat. 51. 54. 52. N.

KALDER DAG, a lofty range of mountains in Asia Minor, extending eastward from Osium Kara Hissar to beyond Ak Shehr.

KALEIDOSCOPE.

KALEIDOSCOPE, an optical instrument, invented by Sir David Brewster, which, by a particular arrangement of mirrors, or reflecting surfaces, presents to the eye, placed in a certain position, symmetrical combinations of images, remarkable for their beauty and the infinite variations of which they are susceptible. The name is derived from the Greek words καλος, *beautiful*, ειδος, *a form* or *appearance*, and σκοπεω, *to see*.

History of the invention.

The effect of combining two or more plane mirrors, so as to produce a multiplication of images, had long been known and described by writers on optics. Baptista Porta, in his *Magia Naturalis*, gives an account of the construction of an instrument, which he calls *polyphaton*, in which two rectangular specula are united by two of their sides, so that they may be opened or shut like a book, and the angles varied; and also of a polygonal speculum, consisting of several mirrors arranged in a polygon, for multiplying in different directions the images of ob-

Kaleidoscope.

jects. Kircher, also, in his *Ars Magna Lucis et Umbræ*, describes, as an invention of his own, the former of these constructions, and distinctly traces the relation between the angle of inclination of the mirrors and the number of images formed. The very same contrivance was afterwards adopted by Bradley, for the purpose of assisting in the designing of garden plots and fortifications; and he states that, " from the most trifling designs, we may, by this means, produce some thousands of good draughts." But the particular application of this principle in the case where the two reflectors are inclined to one another at a small angle, so as to form a series of symmetric images, distinctly visible only in a particular position of the eye, was a discovery reserved for Sir David Brewster. The first idea of this remarkable property occurred to him in the course of some experiments in which he was engaged on the polarization of light, during the year 1814. But the only circumstance which at that time attracted his attention, was the circular arrangement of the images of a candle round a centre, and the multiplication of the sectors formed by the extremities of the plates of glass, between which the light had undergone several successive reflections. In repeating, at a subsequent period, some experiments of M. Biot on the action of homogeneous fluids upon polarised light, and in extending them to other fluids which he had not tried, Sir David Brewster happened, for greater convenience, to place them in a triangular trough, formed by two plates of glass, cemented together by two of their sides, so as to form an acute angle. The ends being closed up with pieces of plate-glass cemented to the other plates, the trough was placed horizontally, for the reception of the fluids. The eye being necessarily placed without the trough, and at one end, some of the cement which had been pressed through between the plates at the object end of the trough appeared to be arranged in a remarkably regular and symmetrical manner. Pursuing the hint thus obtained, and investigating the subject optically, he discovered the leading principles of the kaleidoscope, in as far as the inclination of the reflectors, the position of the object and that of the eye, were concerned. He then constructed an instrument in its simplest form, and showed it to some of the members of the Royal Society of Edinburgh, who were much struck with the beauty of its effects. Several very material improvements were subsequently made by the inventor, in the construction and application of the instrument, for which he then took out a patent. But, in consequence of one of these instruments having found its way to London, its properties became generally known before any number of the patent kaleidoscopes could be prepared for sale. It very quickly became popular, and the sensation it excited in London throughout all ranks of people was astonishing. Kaleidoscopes were manufactured in immense numbers, and were sold as rapidly as they could be made. The instrument was in every body's hands, and people were everywhere seen, even at the corners of streets, looking through the kaleidoscope. It afforded delight to the poor as well as the rich; to the old as well as the young. Large cargoes of them were sent abroad, particularly to the East Indies. They very soon became known throughout Europe, and have been met with by travellers even in the most obscure and retired villages in Switzerland. Sir David Brewster states, that no fewer than two hundred thousand kaleidoscopes were sold in London and Paris in the space of three months; " and yet," says he, " out of this immense number, there is, perhaps, not one thousand constructed upon scientific principles, or capable of giving any thing like a correct idea of the power of the kaleidoscope; and of the millions who have witnessed its effects, there is perhaps not one hundred who have any idea of the principles upon which it is constructed, and of the mode in which those effects are produced." To convey a knowledge of these principles is the object of the present article.

Optical principles on which it acts.

It follows from the optical law of the equality of the angles which the incident and reflected rays make with a line perpendicular to the reflecting surface at the point of incidence, that rays which diverge from any object, and fall on a plane surface, will, after reflection, proceed in the same course as if they had immediately diverged from a point situated at the same distance behind the reflecting surface as the radiant point is before it. This point is called the *virtual focus* of those rays; and the eye receiving them will have the perception of a reversed image of the object in this situation. Thus the miror AA′ (Plate CCCXIX. fig. 1) will produce a reversed image of the object R, situated at the point S, in the line RpS, perpendicular to the surface of the mirror; and this image will appear in the same place whatever be the situation of the eye, as E, provided the reflected rays rE meet it.

Since the course of the reflected rays is the same as if they had immediately proceeded from a real object of S, where its image is seen, this image will, with relation to another mirror, have all the effect of a real object; and a second reflection of the rays by a new mirror at BB′, will produce, at the point T, equally distant from BB′ as S is, but on the other side of it, an image of the first image, visible to the eye at E by the twice reflected rays RqvE. As the first image was reversed with respect to the object, so the second image will be reversed with respect to the first, and therefore direct when compared with the object. The second image may, it is evident, by a new reflection from the first mirror, give rise to a third, which will now again, like the first image, be reversed; and so on, in succession, may a series of images alternately reversed and direct be produced on each side, by two mirrors only, in consequence of multiplied reflections, provided the mirrors are of sufficient extent to admit of them, and provided the eye be so placed as to receive the rays which are last reflected.

If the mirrors be parallel to each other (see fig. 2), the images of the intervening objects, AA′BB′, will be ranged in succession in a continued line on each side. If they be somewhat inclined to each other (as in fig. 3), the images will be disposed in the arch of a circle, having for its centre the point in which the directions of the mirror unite. If the mirrors be of sufficient length, or sufficiently inclined, so as actually to meet; and if, moreover, the angle they form be an even aliquot part of a circle, the images of all the objects situated in the space between them, ABC, fig. 4, will together occupy a circular field, and will be disposed in the form of sectors all round the circle.

General method of tracing the course of the rays.

This circular arrangement of the images, however legitimately it may have been deduced from the simplest law of optics, appears to be so extraordinary an illusion of the sense, as to call for somewhat further examination before we can feel perfectly assured that it is a necessary consequence of that law. Perhaps the most satisfactory method of prosecuting their examination is to investigate separately the mode in which each of the images results from the successive reflections by the two mirrors. A very simple and convenient rule may be laid down for enabling us to trace the whole course, however complex, of the rays which form these images; and this rule will be best understood by considering, as an example, its application to one of the remote images in the circular field. Thus, in the circular field AHL, fig. 5, divided into equal sectors by the radii CF, CG, CH, &c. let S be one of the remoter images of the object R, formed by four reflections from the mirrors AC, BC; and let E be the place of the eye. Draw the line ES, intersecting the radii already mentioned, in P, Q, T, V; make Cq equal to CQ, and join Pq; make Ct equal to CT, and join qt; make Cv equal to CV, and join tv and vR. Then Rvtq PE will be the real course of the rays, by which the image of R is seen at S by the eye at E; for it is sufficiently apparent, without the necessity of a formal demonstration, that by this construction, the equality of the angles of incidence and reflection is everywhere preserved. The different positions of the line PS, that is, PQ, QT, TV, and VS, are in fact the images of Pq, gt, tv, and vR respectively, which are so many portions of the real course of the reflected rays. It is evident that a similar construction will, in every other case, furnish us with the actual course of all the rays from which images result, through all their successive stages of reflection; and it has also the advantage of giving us the exact angles of incidence and reflection throughout the whole path.

We have hitherto, for the sake of perspicuity, supposed both the object and the eye, together with the path of the rays, to be in the same plane. But it is obvious that the same method of construction and of reasoning may be employed in tracing their course, if we suppose the mirrors to be prolonged in a direction perpendicular to the plane of the figure, and the eye raised above that plane. The space between the mirrors, instead of being the sector of a circle merely, is now the sector of a cylinder; which cylinder may be completed by supplying the other sectors which compose it, as is represented in fig. 8, where ACac and BCbc being the mirrors, the rest of the cylindrical space is occupied by complementary sectors. The course of the rays by which the eye at E will see the image S, for instance, of the object R, may readily be traced by drawing a straight line from E to S, which will pass through as many planes BCbc, &c. as the rays have suffered reflections. The portions of the lines ES, intercepted between these planes, may, as in the former case, be regarded as the images (either reversed or direct, as the case may be) of some portion of the actual path of the rays between the mirrors; A will occupy the same position with regard to the complementary sector it traverses, as the real path does in the original sector bounded by the mirrors. By drawing, in this sector, lines similarly situated with respect to its sides, as the several portions, PQ, QT, TS of the lines ES, are with respect to the sides of their respective sectors, we obtain the real course of the rays, RtqpE.

Creation of symmetrical appearances.

Symmetry appears to be the principal constituent of beauty in the forms given to the various works of art which have exercised the skill and ingenuity of man; and the richness of each individual ornament, as well as the pleasing effect of the whole assemblage, is generally in proportion as this principle has received a more perfect development. Even nature, in the multitude of forms with which she has invested the different tribes of the animal creation, has, with but few exceptions, followed the law of symmetry, in as far as respects the perfect similarity of the two sides of the body. In almost all the higher classes, or those which are comprehended under the great division of vertebrated animals, and in many of the inferior tribes, as in insects, one half of the animal form is the reflected image of the other half. A still higher degree of beauty, derived from a more extended symmetry of form, has been displayed in the structure of objects in the vegetable kingdom. Flowers, in particular, derive a peculiar beauty from their presenting to the eye a symmetrical combination of forms with reference to a common centre. This is also the general model followed in the structure of radiated animals, of which the star-fish and sea anemone are examples. In those works of art in which there is the greatest scope for the indulgence of fancy in the production of pleasing effects, the most perfect and successful kinds of ornament are those resulting from a symmetrical arrangement of parts, which is not confined to a single lateral repetition, but is extended in various directions in space, and is multiplied and alternated in different lines, and around different centres. It is the latter of these combinations, more especially, that is represented by the kaleidoscope, namely, the disposition of a certain number of pairs of images symmetrically disposed around one or more centres.

On examining the subject more minutely, we find that the first element of this symmetry consists in the union of any particular form, or of its direct image with its reversed image, by which a new form is created, composed of two simple forms similar to each other, and similarly situated with respect to a given line. If a succession of these compound forms be now arranged around a centre, they will combine into a perfect whole, in which all the similar parts are brought into union, and which must thus afford pleasure, by enabling the mind readily to take in and comprehend every part at a single glance. The operation of the kaleidoscope is, in this way, to create regularity and symmetry out of every form that is presented to it, however irregular in itself that form may be. Thus, out of the few simple lines contained in fig. 9, the appearance presented in fig. 6 is created by the instrument. It is scarcely necessary to observe, that the original lines, which occupy the sector between the mirrors, are seen by direct vision, and that their appearance unites itself on each side with their images seen by reflection. We shall in future designate the whole of the appearance thus produced by the kaleidoscope by the term *spectrum*.

Appearances of polygons, stars, curves.

If we examine the effect produced by each elementary portion of the compound figure of the spectrum, we shall find that any straight line reaching directly across the sector, as *fg* (fig. 9), is formed by the kaleidoscope into a regular polygon, having as many sides as the numbers into which the circular field is divided; if it be at right angles to either of the sides, the polygon will have only half the number of sides. A line, as *mn*, crossing the field between the mirrors in an oblique direction, is converted by the instrument into a polygon of the same number of sides as the former, but with salient and re-entering angles; that is, into the form of a star, with a number of rays equal to half the number of sectors. Another line crossing the field in an opposite direction gives another star, having its rays intermediate to those of the former. Curved lines form by their union a multitude of beautiful and elegant figures, of which the variety is inexhaustible. Each group, taken separately, possesses its peculiar and intrinsic beauty; but the effect of the whole assemblage is considerably heightened by the combination, and by the regularity of the relations that each part bears to all the others.

Requisite conditions.

Having thus given an account of the general principles upon which the kaleidoscope is constructed, and of the mode in which it acts, we are now prepared to direct our attention to the conditions which are required for the perfect performance of its functions.

Economy of light.

If the mirrors of the kaleidoscope could reflect the whole of the light which falls upon them, the images would possess the same degree of brilliancy as the objects from which they are derived; and their number would be limited only by the more or less favourable position of the mirrors, and of the eye with relation to the objects. But as a very large portion of the incident light is, in most cases, destroyed by reflection, it follows that each successive image will be fainter than that which preceded it; and that in the progress of the reflections we must very soon arrive at a limit beyond which they become no longer visible. It is found, from experiment, that the quantity of light lost by reflection is in all cases greatest when the rays fall perpendicularly on the mirror, and least when they fall with the great-

Kaleidoscope.

est obliquity. The difference is more considerable in the case of glass than in that of metallic surfaces. Thus, in a common looking-glass, the images of objects seen by holding it directly opposite to them are produced wholly by the surface of the quicksilver, those reflected by the glass being too faint to occasion any interference. If the glass be placed obliquely, so that the angles of incidence and reflection be large, a greater proportion of light will be reflected from the glass, and the images formed by it will be bright enough to be seen, and will mix themselves with the images from the quicksilver. At a certain angle, both sets of images will appear of equal brightness; and by still further increasing the obliquity, those produced by the quicksilver will gradually fade away, and vanish, leaving the images produced by the glass perfectly distinct, and nearly as brilliant as the objects themselves.

The following table, abridged from one given by Sir David Brewster, and founded on the experiments of Bouguer, shows the number of rays reflected from plate-glass at various angles of incidence, the number of incident rays being supposed to be 1000.

Complement of the Angles of Incidence.	Rays reflected out of 1000.	Complement of the Angles of Incidence.	Rays reflected out of 1000.
$2\frac{1}{2}°$	584	30°	112
5	543	35	79
$7\frac{1}{2}$	474	40	57
10	412	50	34
$12\frac{1}{2}$	356	60	27
15	299	70	25
20	222	80	25
25	157	90	25

With the help of this table, and the method above explained of tracing the course of the rays, and on investigating the angles of incidence, the degree of illumination of any part of the spectrum might be calculated, were it not for a new condition, termed *polarisation*, with which the rays of light are affected by reflection, and which may also contribute to the further loss of light, when the reflection is repeated at certain angles, and in certain positions of the plane in which it takes place; a circumstance which is not without its influence in the case of the kaleidoscope, especially in those constructed with glass mirrors.

As the effect which the kaleidoscope is intended to produce is to be the result of repeated reflections, it is an object of essential importance, in order that as little light may be lost as possible, that all these reflections should take place with the greatest obliquity. With this view, the mirrors should be of considerable length, and the eye should be raised above the field of view, and brought as near as possible to the planes of the mirrors; that is, as near as possible to the remote end of the line of their intersection. From this situation the remoter sectors will be seen by a greater quantity of light than from any other, and consequently the illumination of the spectrum will be more equal in every part. This position of the eye affords the further advantage of giving to the spectrum a circular appearance; for it is obvious, that if viewed from any other and more oblique situation, it would, from the laws of perspective, appear more or less elliptical. It is scarcely necessary to remark, that the eye cannot be mathematically in the line of junction of the mirrors, for no light would in that case reach it by reflection from them.

Proportions of the mirrors.

The essential parts of the kaleidoscope, then, are the two mirrors ACE and BCE (fig. 10), which should be from six to ten inches in length, and from one inch to an inch and a half in breadth at the object end C, while they are made narrower at the other end E. They are kept apart at their upper edges, and united along their lower edges CE, so as to form an angle which must be an even aliquot part of a circle. The angles 36°, 30°, $25\frac{5}{7}$°, $22\frac{1}{2}$°, 20°, or 18°, which divide the circumference of the circle respectively into 10, 12, 14, 16, 18, and 20 equal parts, are the only angles which can conveniently be employed with glass mirrors. The objects to be viewed must occupy the space ABC, between the ends of the mirrors, and must be situated in the plane formed by these lines. They are to be viewed from the opposite or narrow end *e*; the eye being placed near to the angular point E, formed by the junction of the ends of the mirrors. It should, however, be a little above this point, in order that a sufficient quantity of light may enter through the pupil. By trial, the proper distance at which the maximum of illumination is obtained will easily be found.

Accuracy in their junction.

It is of considerable importance that the junction of the mirrors be a perfectly straight line, free from roughness, and from particles of dust. Any irregularity in this line will interfere with the perfection of the image at that part most remote from the object. The projection of this line of junction of the mirrors on the field of view is a line CD, fig. 4, immediately opposite to the middle of the space between the mirrors. If tolerable pains have been taken to apply a straight and smooth edge of one mirror upon the surface of the other, and to preserve them clean, this line will scarcely be seen, more especially as the greater part of it is placed much nearer than the objects contemplated, and lies, therefore, within the distance to which the refractive powers of the eye are adapted; it is, therefore, seen only indistinctly.

Angle of their inclination.

Any deviation in the angle formed by the mirrors from that which accurately divides the circle into an even number of sectors, is quickly perceived by the eye, from the consequent irregularity which takes place in the compound figure of the spectrum at the part most remote from the object. This is illustrated by fig. 7, where the last ray of the star is seen to be imperfect, from the want of correspondence in the images which meet in the remote sector. If the angle be too small, the image is redundant, from a reduplication of one portion; if too large, the image presents a deficiency. But, in consequence of the aperture of the pupil being of sufficient size to admit portions of the images from both mirrors, reflected from the parts immediately adjacent to the line of their junction, these two images will be, for a certain space, seen in the same direction, and will consequently overlap and interfere with each other. As soon as the angle of the mirrors is rendered correct, the double images coalesce into one, and perfect symmetry is restored to the spectrum. It is necessary to observe, that the angle must be an *even* aliquot part of a circle; that is, must divide it into an even number of equal parts. If the division were into an odd number of parts, as in fig. 7, the discordance of the adjacent images at the remote sectors would be the greatest possible. This will appear from considering that the images in the successive sectors on each side, being alternately reversed and direct, those in the sectors immediately adjacent to the radius most remote from the mirrors, would both be of the same kind; the one, therefore, could not be the reverse of the other, a relation which, as we have already seen, is the elementary condition of symmetry in each pair of images. The corresponding parts of each, indeed, instead of being adjacent, would then be the most remote from one another. This circumstance, namely, the necessity of the angle of the mirrors being the even aliquot part of a circle, although it be an essential condition of the instrument, is not mentioned in the specification of Sir David Brewster's patent. It was first noticed by the author of this article in the *Annals of Philosophy*.

If we investigate the proportion of light distributed over

Kaleidoscope.

Dimensions of the mirrors.

the field of view, by considering the degrees of obliquity with which the rays impinge upon the mirrors, and also the number of reflections which they sustain, we shall find that it diminishes nearly in the same proportion as we recede from the edge of the sector bounded by the mirrors, and is least in the remotest sector. The line of equal illumination in each individual sector, or the *isophotal* line, as Sir David Brewster has termed it, is parallel to that radius of the sector which is nearest to the mirror on that side. It follows as a consequence, that the light will diminish in each sector in proportion as we recede from the angular point or common centre of the field. This last circumstance limits us to the magnitude which it would be proper to allow to the field of view, and therefore restricts us in the breadth of the mirrors when they are of a given length. In general, their breadth should not exceed one sixth of their length, and the angle subtended by the circular field will then be about 19°. The proper proportion, however, varies according to the angle at which the mirrors are inclined. The larger this angle, the greater latitude may be allowed in extending the field of view; while, if the angle be small, the number of reflections for completing the remote parts of the spectrum will be great; the light will become too faint to allow the eye to distinguish the parts at the circumference; and the diameter of the field must be contracted by lessening the breadth of the mirrors.

What has now been said relates only to the proportional length and breadth of the mirrors. With regard to their absolute size, we must be guided in our choice by other circumstances of convenience. As the length of the instrument determines the distance of the eye from the field, it should be such as to admit of the distinct vision of every part of the spectrum. This may be effected, if requisite, by interposing a convex lens, of the proper focal distance, between the eye and the narrow end of the mirrors.

Position of the objects.

The last circumstance we shall notice as essential to the perfect operation of the instrument, is, that the objects must be situated as nearly as possible in the plane ABC, fig. 10, formed by the ends of the mirrors. All deviations from this position are productive of irregularity in the spectrum. If the eye, indeed, were a mere mathematical point, and were it possible for it to receive the rays while placed at the very point of the angle E, the distance of the object from the mirrors would, in strictness, produce no deviation from symmetry. Let the plane MN be taken at a little distance from the ends of the mirrors, and the planes of the mirrors produced till they meet it in the lines *ac* and *bc*. It is evident that the space comprehended between these lines, is the only situation in that plane from whence rays can proceed so as to fall upon the mirrors; no object, therefore, which is not within that space, can have its image formed by reflection from the mirrors. The lines *ac* and *bc* are the projections of AC and BC as viewed from the point E. But if the eye be raised to *e*, it will be apparent that a space below the former, and bounded by the lines *de* and *fe*, which will now be the projections of AC and BC, will come into view. The objects situated in this space will have no corresponding images, and their introduction into the field of view will produce confusion in every part of the spectrum. The magnitude of this additional space, measured by the interval *cr*, which is unrepresented by the instrument, and which may be termed the *aberration*, is dependent upon and proportional to two separate causes, namely, the distance of the eye from the angular point, and the distance of the object from the mirrors. The deviation from regularity which it produces in the spectrum increases as the object approaches to the centre. An eye accustomed to observe and admire the symmetry of the combined images will instantly perceive it to be violated, even when the distance of the object Cc is less than the twentieth part of an inch. When the object is very distant, the defect of symmetry is so enormous, that, although the object is seen by direct vision, and also in some of the sectors, it is entirely invisible in the rest. If the object, on the other hand, be placed within the reflectors, a symmetrical spectrum will indeed be formed; but the centre of this spectrum will not coincide with the centre of the circular field of view, and its effect in producing a symmetrical picture is thereby entirely destroyed. In order to insure perfect mathematical symmetry, the objects should, strictly speaking, be limited to lines lying in the same plane, which plane must be exactly in contact with the ends of the mirrors.

Polycentral kaleidoscopes.

We have hitherto considered the effects resulting from the combination of only two mirrors, in which case the field of view is necessarily limited to a circle. But on the very same principles we may, by employing a greater number of mirrors, obtain an extension of this field in all directions, and produce groups of images around several centres, which shall be repeated in perpetual succession on every side. Kaleidoscopes of this description have on that account been called *Polycentral*, and, when properly constructed, their effects are exceedingly beautiful. With respect, also, to their utility, as applicable to the arts, they very far excel the simple kaleidoscope, inasmuch as the occasions requiring an ornamental design for a flat extended surface are of much more ordinary occurrence than those in which we are limited to a circular space. The principles upon which polycentral kaleidoscopes should be constructed, and the conditions to which they are limited, were first pointed out by the author of this article, in the *Annals of Philosophy* (vol. xi. p. 375), soon after the common instrument became known in London.

Only fo[ur] species [ad]mitted [of].

It is evident that, by joining together a number of mirrors, so as to compose the sides of a prism, we might obtain a succession of images in every possible direction. But we must recollect that, for the production of symmetrical combinations of images, we are restricted in our choice of a base for the required prism, to such angles only as will divide the circle into an *even* number of aliquot parts. This condition confines us to a very limited range. It excludes, in the first place, all angles above 90°; and, therefore, all polygons having more than four sides. Of four-sided polygons, the square and the rectangle, where all the angles are right angles, are the only figures that can give symmetrical combinations. After these, there remain only triangles; and, among all the possible varieties of triangles, we can take only such as are formed with angles of 90°, 60°, 45°, or 30°, which are the quotients of 360°, divided by 4, 6, 8, and 12; all the other even aliquot parts of the circle being excluded by the necessary condition that the sum of those angles must be equal to 180°. We are, therefore, limited to the three following species of triangles, represented in figures 15, 16, and 17:

The first having all its angles equal to..60°, 60°, and 60°;
The second its angles respectively equal to....................................90°, 45°, and 45°;
And the third its angles respectively equal to.................................90°, 60°, and 30°;
The sum of these angles, in each case, being 180°.

Let us now inquire into the effects resulting from each of these combinations.

Comparative effects of the

The comparative effects of these four species of polycentral kaleidoscopes are illustrated by figures 14, 15, 16, and 17, where A, in each case, represents the sections of the mirrors, or the base of each prism; B, the elements of each pattern; and C, the pattern itself, resulting from the series of reflected images.

It will be seen that the square polycentral kaleidoscope, fig. 14, produces a less pleasing effect than the others, because the attention being more particularly directed to the repetition of the same set of images in one direction only, the whole pattern appears composed of an alternation of longitudinal stripes. The direction of the stripes is determined by the general direction of the lines, in the elementary pattern approaching more to one of the sides of the base than to the other side. It is scarcely necessary to observe, that the spectrum produced by a rectangular is quite similar to that of a square kaleidoscope, only that it is more extended in one direction.

The first of the triangular polycentral kaleidoscopes (fig. 15), which has for the base of its prism an equilateral triangle, affords very regular combinations of images, disposed in three different directions, which cross each other at angles of 60° and 120°; thus presenting what may be called a triangular symmetry. The circumstance of each pair of images being combined in groups of three together in every part of the spectrum, has suggested the name of *Triascope* for this species of triangular polycentral kaleidoscope.

The second species of triangle (fig. 16), which may be made the base of the prism, is that composed of two contiguous sides, together with the connecting diagonal of a square; or, in other words, of a right-angled isosceles triangle. The result of this construction is to produce a division of the field of view into regular square compartments, having the base of the above-mentioned triangle for their sides. The very perfect symmetry which results from this construction is the source of remarkably beautiful designs; the predominant character of which is an arrangement of forms grouped together by fours at a time, and symmetrically disposed in squares. Such an instrument may, on this account, be called a *Tetrascope.*

The last species of triangular polycentric kaleidoscope, or that which takes for its base the half of an equilateral triangle (fig. 17), resulting from its division by a perpendicular drawn from an angle to the opposite side, affords also appearances of very considerable beauty. Here the predominant form is the hexagon, from the circumstance that the smallest of the angles, which is that of 30°, producing the greatest number of repetitions of the same image around one centre, the symmetry is most conspicuous with reference to that centre, and the attention of the spectator is immediately directed to the hexagonal compartments into which the field is thereby divided. As the pairs of images in these leading objects (such as the stars in the figure, which, it will be observed, have each six rays) are six in number, we shall, following the analogy of the other names, denominate this variety of the instrument a *Hexascope.* These names, derived from the circumstance which gives the chief character of symmetry to the extended spectrum, will perhaps be considered as sufficiently appropriate. They will, at all events, recommend themselves by their brevity, when we consider the very compound epithets which would otherwise be required in order to designate correctly the equiangular, triangular, polycentral kaleidoscope; the rectangular, isosceles, triangular, polycentral kaleidoscope; and the semi, equilateral, triangular, polycentral kaleidoscope.

As a plane surface of indefinite extent admits of subdivision, by regular polygons of the same kind, only in three ways, namely, by triangles, by squares, and by hexagons, so each of these modes of division is the result of a separate arrangement of three plane mirrors, namely, that of the triascope, the tetrascope, and the hexascope. Of these, the last two appear to be those more especially calculated to afford assistance to artists in the invention of ornamental patterns.

It is evident, that the principal advantage which the polycentral kaleidoscopes have over the simple ones, is the greater extension they give to the field of view. This field might, in theory, appear to be infinite; but in practice it soon becomes limited, from the great loss of light attendant on repeated reflections. The effects of polarization, in further diminishing the light, is also greater in them than in the simple kaleidoscope. On both these accounts, metallic are preferable to glass mirrors for their construction. The number of reflections required, in order to obtain any extent of spectrum, being greater than in the ordinary kinds of simple kaleidoscopes, the instrument must be of greater length comparatively with the breadth of the mirrors, as in this way the course of the rays will be more oblique with respect to the mirrors, and a larger portion of light will reach the eye. A greater obliquity is also obtained, with the same proportion between the length and breadth of the mirrors, by making them taper at the end next the eye. The instrument will then, see fig. 18, have the form of a truncated pyramid instead of a prism; ABC being the triangular base, to which the objects are to be applied, and *abc* the narrower end at which the eye is applied. It is true, that, in mathematical strictness, this construction is incorrect; for the mirrors in that case having necessarily a degree of inclination to the base, the spectrum will be composed of portions, not of a plane, but of a spherical surface, which does not admit of the same divisions; but the field really visible to the eye is too limited to render this inaccuracy of any consequence.

Construction of the simple kaleidoscope.

After the detailed explanation which has been given of the principles on which kaleidoscopes act, it will not be necessary to enter into any minute account of the methods of constructing them. A few practical directions may, however, be useful for the guidance of such as wish to provide themselves with this source of innocent amusement. In order to construct the simple kaleidoscope, two slips of plate-glass, about six or eight inches long, and about an inch or an inch and a half in breadth, must be procured. The best form for these plates is that represented in fig. 10, where one end of them is only half the breadth of the other. The newest plate-glass should be employed, as that which is old has frequently scratches and imperfections on its surface, which occasion a great loss of light. They should have been skilfully cut with a diamond, so that at least one of the edges may be perfectly smooth, and free from chips. If this be not the case, one of the edges must be made quite straight, and freed from all imperfections, by grinding it with very fine emery upon a flat surface, such as another piece of plate-glass. The posterior surfaces of each of the plates are now to be covered with a black varnish, or with black sealing-wax, so as to remove its reflective power. When this has been done, and the varnish is dry, take the plate of which the edge has been rendered perfect, and apply this edge against the surface of the other plate, as near as convenient to the edge of this latter plate, and keep the edges so applied in contact, by means of a strip of black silk or cloth glued along the back of the plates, so as to serve the purpose of a hinge, allowing of their opening and closing to a certain extent, like the leaves of a book. They are now to be adjusted to the proper angle, which may be done with the greatest accuracy, by directing the mirrors, placed as in fig. 10, to any line, or the straight edge of any object in contact with the broad ends, and very obliquely situated with respect to the edge of either of the mirrors; then, looking from the other end, open or shut the plates till the figure of a star appears, having six, se-

Kaleidoscope.

ven, eight, or any other number of rays which may be thought desirable, and observing that the images of the rays in the spectrum most remote from the object perfectly coalesce. The mirrors must now be fixed in their position by small arches of wood or brass, extending across the open ends of the plates AB in two or three places. These may at first be attached temporarily by means of sealing-wax; but they should afterwards be fastened more securely by other pieces glued to the plates in several places along the edges Ae, Be. The clearness of the effect of the instrument is much promoted by excluding all light, except what comes from the field of view; and this is best accomplished by laying a strip of black velvet, previous to the fixing of the pieces just described, all along the upper side of the instrument, so as to line the whole of the space between the upper edges of the mirrors. All reflection of light from that quarter is thus effectually precluded.

The plates thus prepared are to be placed in a tube, as represented in fig. 11, so that the broad ends of the mirrors shall barely project beyond the end of the tube; while the narrow end is placed so that the angle formed by the junction of the mirrors shall be a little below the middle of that end of the tube. The plates must then be kept in this position by pieces of cork or wood wedged in between them and the tube; taking care, however, that they press but lightly on the mirrors, for a very slight force is capable of bending and altering the figure, even of very thick plates of glass. A cover, with a circular aperture in the centre, is then to be fitted to the end *abc*, which should, in general, be furnished with a convex lens, whose focal length is an inch or two greater than the length of the mirrors, in order to allow the eye to see every part of the spectrum with perfect distinctness. Persons who are short-sighted will of course not require this lens; but it will still be expedient to close the end *abc* of the mirrors with a piece of plane glass, as a security against the introduction of dust.

Of polycentral kaleidoscopes.

In constructing polycentral kaleidoscopes, where three mirrors are employed, the third mirror occupies the place of the black velvet and connecting pieces already described. Great care should be taken to have three very perfect edges for the junctions of the plates with each other; and considerable attention should be paid to their being fixed at the exact angles required by the construction; and when once placed correctly, they are to be retained in their relative position by effectual securities. Similar remarks apply to the construction of square and rectangular polycentral kaleidoscopes.

Revolving object case.

The instrument, when so far completed, is now ready to be applied to the objects which are to form the spectrum. A case for holding these objects, and for communicating to them a revolving motion, is fitted to the object end of the tube. The best construction for such a case is the following: Upon the end of the tube *abcd*, fig. 12 (corresponding to the end of the mirrors ABC, fig. 11), is placed a ring of brass, *mn*, which moves easily upon the tube, and is kept in its place by a shoulder of brass on each side of it. A brass cell, MN, is then made to slip tightly upon the moveable ring *mn*, so that when the cell is turned round by means of the milled end at MN, the ring *mn* may move freely upon the tube. The objects are to be placed in a small box, consisting of two glasses, one transparent, and the other ground, kept at the distance of one eighth or one tenth of an inch by a brass rim. This brass rim should consist of two pieces which should screw into one another, so that the box can be opened by unscrewing it, and the objects changed at pleasure. This object box is placed at the bottom of the cell MN, as shown at OP; and the depth of the cell is such as to allow the side O to touch the end of the mirrors when the cell is slipped upon the ring *mn*. The instrument, when used, is to be held in one hand, with the angular point E downwards, and the cell is turned round with the other, so as to present the objects in succession before the aperture ACB, fig. 11.

Selection of proper objects.

The objects best fitted for producing pleasing effects are small fragments of coloured glass, of sufficient size to occupy a certain portion of the interval between the mirrors, but not so large as to engross the greater part, or to interfere with each other's motions, as they are made to fall in succession into the field of view, by the revolution of the case which holds them. Wires of glass, both spun and twisted, and of different colours and shades of colours, and of various shapes, both curvilineal and angular, may be intermixed with the larger masses of coloured glass, together with one or two beads, bugles, fine needles, bent metallic wires, small pieces of lace, and fragments of fine sea-weed. Looped curves like the figure 8, double curves like the letter S or the figure 3, circles, ovals, spirals, triangles, or lines bent into angles like the letter W or Z, have generally a good effect, either alone or in combination with other objects. Care should, however, be taken not to crowd the case with too many objects at a time, as an excess in this respect produces a degree of complexity totally inconsistent with beauty. In order to obtain a greater variety in the styles of patterns produced, a number of different cases, with objects, may be provided, so as to fit on occasionally, and be changed at pleasure.

Telescopic or compound kaleidoscope.

By Sir David Brewster's very ingenious contrivance of substituting for the case of objects above described, and which is applied in contact with the ends of the mirrors, a convex lens placed at a certain distance from them, the images of distant objects may be brought to occupy the exact place adapted for their reflection by the kaleidoscope, and may thus afford a still greater variety of symmetric combinations. This operation of the lens is illustrated by fig. 13, where the lens L forms an image of the object R at F, the space between the ends of the mirrors, which image is multiplied by the reflecting powers of the instrument, and forms a symmetric spectrum, precisely in the same way as if a real object of that size had occupied its place. The lens may be fitted to the end of a separate tube, external to that of the instrument, and capable of being drawn out upon it to the proper distance, which is known by observing when the spectrum appears perfectly symmetrical. The instrument in this form has been called the *Telescopic* or *Compound Kaleidoscope;* and is applicable to distant objects of every description, and equally so to those in motion as to those at rest. All their movements are represented with singular effect in the spectrum. A blazing fire viewed by it gives the appearance of beautiful fire-works, at one time rushing with great rapidity towards the centre, and at another issuing from it towards the circumference, or darting in splendid starriform corruscations over the field of vision. These varieties in the spectrum are occasioned both by turning the instrument round its axis, and by moving it forwards in any direction.

The compound kaleidoscope has thus a much more extended range than the common kind; and it has this further advantage, that it admits of the symmetry of the spectrum being rendered perfectly correct, since the images may be brought exactly to the ends of the mirrors; a condition which can never be completely obtained when the objects are confined in a glass case, as they must then always be separated from the mirrors by at least the thickness of the glass.

The focal length of the lens should always be much less than the length of the outer tube, and should in general be such as to be capable of forming an image at the lendar || lenda- ium stum. end of the mirrors, when the object is four or five inches from the lens. Its diameter should be such as that, when it is at its greatest distance from the mirrors, it shall still occupy the whole of the field of view which is seen by direct vision; or, in other words, that the eye shall not see any part of its edge.

Appli- on to magic lanthorn, & The exhibition of the effects of the kaleidoscope to a number of spectators at the same time, by throwing the images on a wall, after the manner of the magic lanthorn, or solar microscope, might be easily accomplished, if sufficient light could be procured for the illumination of the objects. The form of an instrument for this purpose is represented in fig. 20, where L is the lamp, the light from which being augmented by the reflector M, and concentrated by the very convex lens N, upon the transparent objects at the end of the kaleidoscope K, is formed into an image on the opposite wall by refraction through the lens P, the focal distance of which is somewhat shorter than the length of the tube. The brilliant light produced during combustion carried on by means of a stream of oxygen gas is peculiarly fitted for the exhibition of these effects, as was very successfully shown by Mr William Allan, in his lectures at Guy's Hospital, London.

By a contrivance on a similar principle, the patterns formed by the kaleidoscope may be copied, if thought necessary, by receiving them in a camera obscura. The readiest mode of tracing them, however, is by the use of a camera lucida, applied to the instrument at the end next the eye. The kaleidoscope might also be applied to the microscope, if it were worth while to multiply these applications; for which, however, considering the infinite variety of designs which the simpler instruments afford, there appears not to be the least necessity.

Solid kaleidoscopes. Instead of employing the exterior surfaces of glass as the reflectors, we may employ the interior surfaces of a prism of solid glass for that same purpose; and we may obtain in this way, as was shown by Sir David Brewster, a total instead of a partial reflection of light. This solid form of the instrument is peculiarly fitted for polycentral kaleidoscopes; but it is liable to the objection of its being extremely difficult to procure a piece of glass of sufficient size entirely free from veins, and also to obtain the perfect junction of the two reflecting planes.

Polyangular, annular, and rectilineal kaleidoscopes. Simple kaleidoscopes have been variously constructed with reference to the angles of inclination of the mirrors. In some instruments, called by Sir David Brewster *Polyangular Kaleidoscopes*, this angle may be varied at pleasure, by allowing the mirrors to move on their connecting edges as on a hinge, so as to open or close at pleasure by means of a screw. Others admit of the mirrors entirely separating, so as gradually to become parallel to each other, and thus give rectilineal or annular patterns, as is seen in figures 2 and 3. But there is no occasion to dwell more particularly on these subjects, as the circumstances of their construction and effects must be sufficiently obvious from what has been already said; and there is probably more ingenuity than utility in devising these variations. We shall therefore conclude, by merely noticing a convenient mode of uniting several of these instruments, which was suggested by the auther of this article, with a view to compare the effects of the simple and polycentric kaleidoscopes, applied to the very same set of objects. Fig. 20 shows a section of that instrument, in which *mn* are the mirrors of a simple kaleidoscope in the middle of the tube *t*, and which might be set to any angle; the mirrors *def* on one side forming a tetrascope, and *pqr* on the other, a hexascope. The whole was enclosed in the tube *t*, at the eye end of which were three separate apertures, in order to allow the observer to look through each in succession. The other end was fitted with a case of moveable objects, as in figure 12; and was also provided with an additional tube for the reception of a lens instead of the case, and capable of being drawn, so as to convert the whole into a telescopic instrument. The effect of the whole combination was very striking.

See Sir David Brewster's *Treatise on the Kaleidoscope*, Edinb. 1819; Harris's *Treatise on Optics;* Wood's *Optics;* Dr Roget *on the Kaleidoscope, in the Annals of Philosophy*, vol. xi. p. 375; and the *Compte rendu des Travaux de l'Académie de Dijon, pour* 1818, p. 108–117.

KALENDAR, a distribution of time, accommodated to the uses of life. See Calendar.

Kalendar, *Kalendarium*, originally denoted, amongst the Romans, a book containing an account of monies at interest, which became due upon the kalends of January, the usual time when the Roman usurers let out their money.

Kalendar Months, the solar months, as they stand in the kalendar, beginning with January.

Astronomical Kalendar, an instrument engraved upon copper-plates, printed on paper, and pasted on board, with a brass slider which carries a hair, and shows by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will show.

Kalendar Brothers, a sort of devout fraternities, composed of ecclesiastics as well as laymen, whose chief business it was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated *kalend-brothers*, because they usually met upon the kalends of each month, though in some places only once a quarter.

KALENDARIUM Festum. The Christians retained much of the ceremony and wantonness of the kalends of January, which for many ages was held as a festival, and celebrated by the clergy with great indecency, under the names of *festum kalendarum*, or *hypodiaconorum*, or *stultorum*, that is, "the feast of fools;" sometimes also *libertas decembrica*. The people met masked in the church, and in a ludicrous way proceeded to the election of a mock pope or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion. Fathers, councils, and popes, long laboured in vain to restrain this license, which prevailed even at the close of the fifteenth century.

Kalends. KALENDS, or Calends, in the Roman chronology, the first day of every month. The word is formed from a Greek word signifying to call or proclaim, because, before the publication of the Roman *fasti*, it was one of the offices of the *pontifices* to watch the appearance of the new moon, and give notice thereof to the *rex sacrificulus;* upon which a sacrifice being offered, the pontiff summoned the people together in the capitol, and there with a loud voice proclaimed the number of kalends, or the day whereon the nones would fall, which he did by repeating this formula as often as there were days of kalends, *Calo Juno Novella.* Hence the name of *calendæ* was given thereto, from *calo, calare.* This is the account given by Varro. Others derive the appellation from the circumstance, that the people being convened on this day, the pontifex called or proclaimed the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the *fasti* or kalendar to be set up in public places, that every body might know the differences of times, and the return of the festivals.

The kalends were reckoned backwards, or in a retrograde order. Thus the first of May being the kalends of May, the last or the 30th of April was the *pridie kalendas*, or second of the kalends of May; the 29th of April, the third of the kalends, or before the kalends; and so backwards to the 13th, where the ides commence; which are likewise numbered inversely to the fifth, where the nones begin; which are numbered after the same manner to the first day of the month, which is the kalends of April. See IDES and NONES.

The rules of computation by kalends are included in the following verses:

> Prima dies mensis cujusque est dicta *kalendæ:*
> Sex Maius nonas, October, Julius, et Mars;
> Quatuor at reliqui: habet idus quilibet octo.
> Inde dies reliquos omnes dic esse *kalendas;*
> Quas retro numerans dices a mense sequente.

To find the day of the kalends answering to any day of the month we are in; see how many days there are yet remaining of the month, and to that number add two. For example, suppose it the 22d day of April; it is then the 10th of the kalends of May. For April contains 30 days; and 22 taken from 30, there remain 8; to which two being added, the sum is 10. The reason of adding two is, because the last day of the month is called *secundo kalendas*, the last but one *tertio kalendas*, and so on.

The Roman writers themselves are at a loss to account for this absurd and whimsical manner of computing the days of the month; yet it is still kept up in the Roman chancery, and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

KALENDS are also used in church history to denote conferences anciently held by the clergy of each deanry, on the first day of every month, concerning their duty and conduct, especially in what related to the imposition of penance.

KALENDS of January, in Roman antiquity, was a solemn festival consecrated to Juno and Janus, in which the Romans offered vows and sacrifices to those deities, and exchanged presents amongst themselves as a token of friendship.

KALHAT, a sea-port of Arabia, in the province of Ammon, situated at the mouth of a river which falls into the Persian Gulf. It is eighty miles south-east of Muscat.

KALISCH, a city of Poland, the capital of the circle of that name. It is situated between the branches of the river Prosna, in a marshy situation. It contains ten churches, one of which, formerly the Jesuits', is now used by Lutherans. There is a college for military students, in an university which belonged to the Jesuits. It contains 7310 inhabitants, of whom 1800 are Jews. There are manufactories of cloth, hats, and linen goods, and a large annual fair. Long. 18. 55. E. Lat. 51. 51. N.

KALKAS, a race of Mongols, who inhabit an extensive tract of country to the north of China, bordering on Siberia. Their princes and pontiffs dwelt a few years ago in a camp, which is now converted into a city. Only the temples and abodes of the priests, and that of the Chinese viceroy, are built of wood. The rest of the nation dwell in tents.

KALKOON, or Turkey islands, a cluster of small islands in the Eastern Seas, surrounded by dangerous and extensive shoals. Long. 115. 45. E. Lat. 6. 15. S.

KALMUCKS, a tribe of those wandering Tartars who, in the thirteenth century, under Jenghis Khan, subdued and desolated the whole breadth of Asia. The Kalmucks (See ASIA) are distinguished from the other nations of Asia by their peculiar physiognomy. They are in general of the middle size, powerfully and well made, except in their thighs and legs, which are somewhat bent. A large head, round face, dark olive complexion, high and prominent cheek bones, sparkling black eyes punctured in the head, and widely separated from each other, a flat broad nose scarcely rising above the level of the face, and turned up, with two immense nostrils, thick and fleshy lips, and exceedingly white teeth, a short chin, and a thin scanty beard, with black coarse hair, complete the portrait of a Kalmuck face. In many of the women, however, these harsh features are softened, and they have agreeable countenances, with very delicate complexions, which are set off by fine black hair; so that some of the higher classes would even be considered as beauties by the Europeans. They are, like all barbarians, coarse, filthy, and disgusting in their habits; they are covered with grease and vermin, and slovenly and dirty in the extreme. Nor do their moral qualities make amends for these defects. Morality is indeed amongst all nations upon a level with their intelligence, and amongst barbarians is generally at a low ebb. The Kalmucks are accordingly represented as being addicted to lying and cheating, though travellers report that robberies are rare amongst them, and that a murder is almost unknown. They pay great respect to old age; and, though hot in their temperament, and fierce when irritated, they in general live amicably together. Whoever receives a present of meat or drink divides it faithfully amongst his companions; and if a relative has lost his flocks or other substance by war or accident, he is sure to be liberally rewarded. According to Pallas, a Kalmuck provided with a horse, with arms, and equipage, may ramble from one place to another for three months together, without taking with him money or provisions. His friends and relatives, however distant, receive him with all that hospitality which distinguishes barbarous nations; and wherever he goes he meets with the kindest reception, and is entertained in the best manner that their circumstances afford. And a stranger, from whatever country he comes, is sure to be well received by the Kalmucks. His property is faithfully kept for him the moment he puts himself under the protection of his host, it being considered as a crime of the deepest dye to rob any one who is a guest. These tribes, from the prince to the peasant, dwell in tents, which are their only habitations, and are all of a circular form, with a conical roof, and a hole at the top. They are covered with felt made of camels' hair or wool, and are constructed of cane or wood. One of their encampments presents the appearance of a city, with regular streets, sometimes extending a mile in length, and containing numerous shops, where several of the more refined arts are carried on. Here are artificers in copper, brass, and iron; also goldsmiths, who make trinkets for their women, idols of gold and silver, and vessels for their altars; also others who are expert at inlaid work and enamelling. Dr Clarke asserts that these oriental tribes of Kalmucks have, from time immemorial, possessed the art of making gunpowder. The riches of the Kalmucks consist entirely in their flocks. Their habits are wholly pastoral; and they never think of cultivating the ground, though they inhabit extensive tracts of luxuriant meadows, which are of peculiar fertility. Like all pastoral tribes, they emigrate with the seasons, residing with their flocks in the mountains during the summer, and descending in the winter to the verdant plains. They have few camels, these being delicate and difficult to rear; and they are chiefly possessed by priests and by the richer classes. Their horses are small but very swift, and are capable of enduring great fatigue, galloping for several hours successively without injury, or passing a whole day without drinking. Their horned cattle are of a beautiful shape; and their sheep are the same as those which are found throughout Great Tartary. They are exceedingly fat, with large tails and broad and pendent ears; but their wool is so coarse that it can only be used in the manufacture of felt. They live on the milk and flesh of their cattle, and have no objection to horse flesh. They make a fermented liquor from mare's milk, from which they distil a spirit called *koumiss*, of which they are very fond. They are also extremely partial to tobacco and tea. Their principal amusements are hunting, wrestling, archery, and horse-racing. They are expert horsemen, being trained to it from their infancy; and the women are equally skilful with the men. They are, like all barbarous tribes, passionately addicted to gaming; and often lose at cards all that they possess, even to their very clothes. They have also chess, draughts, and backgammon; and the youth of both sexes amuse themselves with singing and dancing to the two-stringed lute. Their most common diseases are malignant fevers, which are greatly aggravated by their gross diet and want of cleanliness. The itch, and other cutaneous diseases, are also common amongst them. Their religion is pagan, and their priests, as amongst every ignorant and superstitious people, are treated with the most extraordinary respect. Their commerce consists entirely in the exchange of their horses and cattle for corn, woollen cloths, linens, copper, pewter, kitchen utensils, knives, and spoons; and great numbers of them visit Astrakan for this purpose. They never deal in slaves; but such prisoners as they take in war are naturalized, and adopted into the tribe.

This powerful tribe, like all the other pastoral states of Asia, has been greatly reduced, both in numbers and extent of territory, by the increasing power of the civilized nations by whom they are surrounded. Before their subjugation or dispersion, they were divided into three principal branches; the Soonganes, the Coschotes, and the Torgots. Of these, the first were engaged in almost perpetual hostilities with the Mongols and Chinese. The Coschotes, on the conquest of Thibet, became subject to the Chinese; and still continue under the protection of that power, except a smaller part which had retired to the Irtish, and fell under the dominion of the Soonganes. The Torgots, who had separated themselves from the Soonganes, settled at an early period amongst the steppes on the Volga; but many of them, disgusted with the tyranny of Russia, returned in great numbers in 1770 and 1771, over the river Ural, on the ice, and across the Kirgusian steppes into Soongaria. It was in 1720 that the Kalmucks were driven from Thibet; and about forty years afterwards, by the extension of Kiang Long's conquests, such as refused to submit to his authority were compelled to seek for new settlements towards the west. Many of them accordingly dispersed themselves in the interior parts of Asia, and amongst the cities of the Usbeck Tartars; others took refuge in Russia, and some thousands fled to Siberia, but the greater number submitted to the Chinese sovereignty. At present the most numerous and powerful tribes of the Kalmucks inhabit the country lying between the Caspian Sea, Muscovy, Samarcand, and Cashgar. Others occupy with their flocks and herds both banks of the Volga, between the Irghis and the Caspian, and extend their excursions on both sides of the Don and the Ural. (F.)

KALUBBLUB, a small island in the Eastern Seas, near the south-western coast of Mindanao. Long. 121. 32. E. Lat. 6. 46. N.

KALUGA, a government or province of Russia in Europe, extending over 13,142 square miles. It contains twelve cities, twelve market-towns, and 2061 villages and hamlets, of which 351, with the people in them, belong to the crown. The whole number of inhabitants are 1,159,600. It is divided into eleven circles. It is generally a level country, the most fertile and the best cultivated of any in the Russian empire, and is the chief source of the supply of provisions to the ancient capital, Moscow. It is estimated to produce 1,600,000 quarters of corn yearly, besides other vegetables for food, and a large quantity of hemp, flax, and fat cattle. The woods are extensive, and yield more fuel than the internal consumption requires. The chief employment, besides agriculture, consists in spinning flax and hemp. It is well watered by the navigable rivers Oka and Shisdra, and by many smaller streams that empty their waters into them. The climate is deemed the most healthy in Russia, and it is certainly the mildest. The city of Kaluga is the capital of the province, as well as of a circle of the same name, which comprehends in it 795 square miles, one city, and 160 villages, with 72,198 inhabitants. It stands on the river Oka, where the Kainschka falls into it. The walls have been recently converted into promenades. It is the see of a bishop, who has a handsome palace. It contains twenty-four churches, 3827 houses mostly of wood, and 24,500 inhabitants, whose chief employment is making sail-cloth and other linen goods, and who, besides, carry on cotton, paper, and china manufactures, and distilleries, sugar refineries, and breweries, all of which render it a flourishing place. Long. 26. 4. E. Lat. 54. 30. N.

KALW, a city of the kingdom of Wirtemberg, in the circle of the Black Forest, and capital of a bailiwick of the same name, which extends over 168 square miles, and contains a population of 20,500 persons. The city is situated on the river Nagold, which divides it into the upper and lower town. It contains 540 houses, with 4250 inhabitants, who are employed in woollen, cotton, and leather manufactures, and carry on much trade in rafting timber by the river.

KAMAKURA, an island in the Eastern Seas, near the south coast of Niphon, in Japan, about three miles in circumference, and surrounded with very high and steep rocks. It is used as a state prison.

KAMENEZ, a city of the province of Podolia, in Russia, the capital of the circle of that name, and the see of the Greek archbishop of Podolia and Brazlow, as well as that of the Catholic bishop of Podolsk. It is, like all the Polish towns, ill built, chiefly of wood, with narrow, crooked streets. It has numerous churches, with several convents, 943 houses, and 5658 inhabitants. Long. 26. 59. 10. E. Lat. 48. 40. 50. N.

KAMINIEC, an ancient town, the capital of the province of Podolia, when it formed part of the kingdom of Poland, but occupied by Russia when that unfortunate country was dismembered the second time. It stands a little to the north of the river Dniester, and was once the strongest fortified place on that frontier. There is some trade, chiefly with Moldavia. It has a Popish and an Arminian bishop. The population is 5600 persons, many of whom are Jews. Long. 27. 1. 30. E. Lat. 48. 50. N.

KAMTSCHATKA, a large peninsula of Asia, which runs out from the north-east coast in a southern direction about 600 or 700 miles, from lat. 59. to 51. N., whilst its greatest breadth is not above half as much. It forms part of the Russian government of Irkoutsk, to which it is joined at its northern extremity. On the east it is bounded by the North Pacific Ocean, and on the west by that large gulf called the Sea of Okhotsk. The country is of a very unequal surface. A chain of elevated mountains with numerous lofty peaks extends from north to south along the whole length of the peninsula, from which numerous rivers spring, and find their way to the ocean. The chief of these, and the only stream that is navigable, is the Kamtschatka, which admits vessels of 100 tons burden fifty miles up the stream. The country also contains many lakes of a considerable size, and so numerous that all intercourse between the several parts of the peninsula during spring, summer, and autumn, is effectually precluded. The mountains are volcanic, and of very great height; the most remarkable is one situated near Nijni Kamtschatsk, which, it is said, is visible at the distance of nearly 200 miles, and which, in this case, must rise to an enormous height. This mountain is an active volcano, subject to frequent eruptions, which often continue for a fortnight without interruption, covering the whole country for thirty miles round with ashes to the depth of several inches; torrents of flame and lava continually bursting forth, and melting the snows with which the mountain is at all times covered. The years 1737, 1762, and 1767, were distinguished by dreadful eruptions from this volcano.

The climate is ungenial, and cold to a degree scarcely accounted for by the latitude, and is probably owing to the snow-clad mountains, and to the heavy rains and still heavier fogs which settle upon this land from the seas by which it is surrounded. Winter may be said to occupy more than one half of the year, the snow lying upon the ground for seven or eight months; spring and summer the other half. The winters are not so severe as in Siberia, the thermometer never descending in the southern parts of the peninsula below 20° of Reaumur, and seldom below 12° and 15°. Spring is the finest season of the year, the summer being extremely disagreeable, owing to the rains and fogs already mentioned. The greatest heat is in July, when the thermometer is 27° and 28° of Reaumur. Owing to the absence of heat, the variable nature of the climate, the prevalence of rain and of heavy fogs, and to the short and imperfect summer, joined to the stony character of the soil, the country is unproductive, and can hardly be made to yield grain even in the smallest quantity. Its produce is confined to wild vegetables. Wild berries, wild garlic, and roots abound, and greens, turnips, and radishes might with care be everywhere produced. One of the most valuable productions is a root called *duranne*, which grows wild, and supplies in some degree the place of bread; also a plant called sweet grass, which is used in cookery, and from which a spirituous liquor is distilled, equal in strength to brandy. The trees are numerous, though stunted in their size; the birch is most common, also the willow and some kinds of dwarf pines and cedars. Shrubs are more plentiful. But the chief riches of Kamtschatka consist in the variety and abundance of wild animals which range over its unproductive wastes, and in the great numbers of fish which swarm in all its rivers. The animals of the chase are found in prodigious numbers; and, as in all cold climates, they are provided with a covering of the richest furs. The animal from which the sable is procured is even more plentiful than in Siberia, though the fur is not quite so beautiful. There are several species of the arctic fox, particularly one called the *ognefka*, or the fiery-red fox of Kamtschatka, which is the finest species. The other animals are the beaver, the hare, the marmot, sea and river otters. Bears, wolves, rein-deer, and mountain sheep, and sometimes a few lynxes, are to be found; and hunting, especially of the bear, constitutes one of the chief occupations of the Kamtschadales. The dogs of Kamtschatka, which are trained to useful occupations, are much valued. These faithful animals are employed to transport fish, supply the house with water and the cattle with hay, and to do all the work for which horses are employed in England. They are fed well or ill according to circumstances, but are always left to shift for themselves from June to October. They are of a coarse appearance, in shape resembling the common house-dog; but are endowed with uncommon sagacity. The fish, which swarm in the rivers and around the coasts, supply the chief article of food to the inhabitants. The salmon, herrings, and different kinds of shell-fish, are of particular excellence; and great benefit accrues from the numerous whales which are cast upon the shores. Independently of fish and wild animals, the Kamtschadales derive also a considerable benefit from the surprising quantities of geese, ducks, swans, snipes, and wild cocks, which are found in their country. They are preserved either by salting, or by being dipt in water, which freezes and keeps them fresh whilst the winter continues. The ducks and snipes are excellent; also the geese, swans, and wild sheep, which are considered as venison. With all these resources for their subsistence, fish, flesh, and fowl, wild berries, and roots in great variety and abundance, with immense quantities of furs of the warmest and most durable kind for clothing, and, for firing and building, wood in profusion for their limited wants, the inhabitants of Kamtschatka have an ample supply of the necessaries of life placed at their disposal.

The inhabitants of this peninsula formerly lived in the filthy and famished condition of savages, and since they have come under the dominion of the Russians they are not greatly improved; so difficult is it to change the moral habits of a people. They are in general of low stature, with broad shoulders and a large head and short legs; the face, and particularly the nose, long and flat, with small and sunk eyes, thin lips, and scarcely any beard, which is a complete Tartar portrait, both in figure and features, and proves them to have sprung from this great Asiatic stock. They are now, as mentioned by Captain Cochrane, who traversed so large a portion of Asia on foot, established in villages, all built in the old Russian style, which are clean and comfortable. During the summer or fishing season they leave their winter residences for the places which they use for drying fish. The summer is thus occupied in providing food for the winter, which is mostly employed in the chase. But though the above traveller represents the inhabitants of this wild and inhospitable country as amiable and honest in their dispositions, he still characterises the Kamtschadale, after providing his winter store, as being, beyond this, "the same lazy, drunken, servile animal as formerly."[1] Their ancient language is not forgotten, though most of them speak the Russian. The number of real Kamtschadales who retain their ancient usages is small. They reside on the northern coasts, beyond Tygil and Nijni Kamtschatsk. Hospitality, the virtue of all rude nations, is the most striking feature in their character, though they are also remarkable for their strict adherence to truth. Their character is represented by other travellers as mild and hospitable, living together in general in great harmony, and even, when necessary, notwithstanding their usual habits of laziness, assisting each other in their labours. They are a healthy race, enjoying, notwithstanding the rudeness of the climate, great vigour of constitution, so that they are subject to but few maladies, and generally reach an advanced age. Since they have been subjected to the Russian dominion, they are prohibited from going to war, though formerly wars were frequent amongst them, and were carried on with all the characteristic cunning and cruelty of savages. It was not their common practice to engage in regular battle, but the hostile parties laid ambuscades for each other; and when they succeeded they killed the men and children, and carried off the women. Sometimes a party, surprised by their enemies, would, in their desperation, first kill their women, and then themselves. Their arms are clubs, lances, and arrows pointed with bone. Now that they are compelled to remain at peace, they have sunk into indolence and the coarsest sensuality; they devour their fish, which is their principal food, raw, with eager avidity, and without the slightest regard to cleanliness or delicacy. Salmon is their greatest delicacy, and they bury it in the ground till it become putrid, when they consider it as in the best state to be eaten. Their whole habits, both in eating and in every other part of their domestic economy, are filthy in the extreme; no part of their body is ever washed, neither their face, hands, nor

[1] *Narrative of a Pedestrian Journey through Russia and Siberian Tartary*, by Captain John Dundas Cochrane, R. N. vol. ii. p. 42.

feet. Their manners, however, are lively and cheerful; they delight in dancing, which causes them entirely to shake off their natural indolence; their songs are full of rude mirth; they have agreeable voices, though their tunes are very rude; and they are fond of feats of mimicry, in which they excel. One of their favourite dances is the imitation of the gestures and attitudes of a bear in moving quietly along, or in the act of seizing its prey. All these they represent to the life; and in the distortions into which they throw themselves in order to perform these uncouth exhibitions, they undergo a degree of labour which astonishes all travellers, considering their natural indolence and aversion to all bodily exertion. The admiration which the spectators express on beholding these performances, rude as they are, is unbounded. These social meetings of the Kamtschadales are not always, however, the most pure. Licentiousness prevails, and the females are by no means scrupulous in their conduct. It is their practice to go out at a particular season to collect roots and vegetables for winter consumption; and they celebrate this time, which is a holiday festival, with all the unbounded license of bacchanalian revellers. Like all rude nations, they are extremely superstitious. They formerly relied for aid, in all extremities, on their own priests, the Shamanes; but they have now transferred their veneration to the Russian priests, to whom they give presents of furs, whilst all that was exacted by the former for their spiritual aid was a hearty meal.

The Kamtschadales had formerly their winter and their summer habitations, the former sunk some feet under ground for the sake of warmth, the walls formed of trees laid over each other and plastered with clay, the roof slanting, and covered with coarse grass or rushes: their houses now exactly resemble those of their conquerors, and a Kamtschadale is a counterpart of a Russian village. It is extremely dirty and uncomfortable, and the intercourse with the Russians has in no respect reformed the original habits of the inhabitants. The dirt, and stench, and soot, issuing from the lamp of a Kamtschadale cottage, are what only a native could endure. "They seem," says Cochrane, "a race disburdened of all care and consideration for the future, and are entirely resigned to any fate which may await them, whether it be oppression, starvation, or disease." The summer house is raised to the height of twelve or thirteen feet from the ground, by a number of posts, which support a platform made of rafters and covered with clay, which serves as the floor, whence the house ascends in the form of a cone, covered with thatch or dried grass; and here the whole family eat and sleep. The purpose of raising up the house upon these posts is to afford a space sheltered from the sun and the rain, where they can conveniently dry the fish, which are accordingly attached to the posts and ceiling for this purpose.

The Kamtschadales have few domestic animals. According to the last census, Captain Cochrane informs us that the number of horses throughout the whole peninsula did not exceed 109, and the number of horned cattle 968, two thirds of which are in the hands of the Russians, and about 400 head of cattle in the possession of 3400 Kamtschadales and Koriaks. The cattle left by Captain King have not multiplied as was expected, which is a great loss to the inhabitants, as the introduction of horses and horned cattle would tend to ameliorate the condition of the people. The extensive meadows of Kamtschatka would afford ample pasture for large herds of cattle, nor is the climate too severe; and the neglect, therefore, of supplying the country with these is ascribed by Cochrane to the interested views of the Russian chiefs, more intent on their own selfish objects than on the public good. At present, the large species of dog, which rather resembles the mountain or shepherd dogs of Europe, is the only beast of burden which the inhabitants use; and there is no individual, either Russian or native, who has less than five. These dogs are harnessed to a sledge, two and two abreast, with one peculiarly well trained and intelligent placed in front as a leader. They have different cries to encourage and spur them on, or to direct their course. The cry of "tag, tag," turns them to the right; that of "kongha, kongha," to the left; "ah, ah," stops them; and "ha" hastens their departure. A sledge for personal convenience is drawn by four or five dogs, one for baggage by ten. The travelling sledge is in the form of an oblong basket, three feet in length and one foot in breadth, and raised three feet from the ground; and both extremities are elevated in a curve. On this vehicle the rider sits astride, or more commonly sideways; and it is reckoned the perfection of charioteering to drive standing on one foot. Whilst the vehicle is passing over uneven ground, it is extremely difficult to maintain the balance; and inexperienced riders are consequently in great danger of being thrown out and of overturning the carriage. The only instrument they use is a stick, which they throw at the dogs, and catch again with amazing dexterity.

Of the origin and history of the Kamtschadales we have no accurate accounts; and very little is known of them beyond the last 130 years. The country was visited in 1649 by some Russians, whose vessel was wrecked on the coast. They lived in peace with the natives for a considerable time; but afterwards quarrelling among themselves, were murdered. It was not till the year 1696 that a body of Cossacks from Anadirsk penetrated into the country. From that time they were involved in perpetual hostilities with the natives. Successive expeditions were sent into this inhospitable country, and the Russians advanced farther and farther, erecting forts and levying tribute, until all Kamtschatka was, in 1706, surveyed and occupied by them. From this period it has been governed by Russia; and though the sway of the emperor has been mild, yet the inhabitants have been severely oppressed by their own magistrates, each of whom is a petty despot within his own district. Each ostrog or district is permitted to choose its own magistrates, the chief of whom is called a *toion*, who is merely a peasant like those whom he governs, and has no outward mark of distinction. He has another magistrate under him, called *yesaoul*, who assists him in his functions, and in his absence acts as his deputy. These magistrates have a general charge over the peace of the district; they are besides collectors of the tax, and possess large discretionary powers, which they often abuse in oppressing the inhabitants. The *yasack* is an inconsiderable pecuniary tax, which is paid by a contribution of furs from each village, but is rendered odious and oppressive from the arbitrary manner in which it is collected. The furs are often undervalued, especially if the toion or chief of a village does not properly compliment the chief officers on his annual visit. Cochrane mentions that he had seen sables valued at 2s. 6d., for which merchants would have given 12s. These furs, though of the finest quality, and worth 40s. a pair, are never averaged at more than 10s. This tax is payable to the emperor, and also to his deputies; so that, by their arbitrary exactions, it is often paid five times over. Besides this, there is a capitation tax of 7d. on each individual; and to enforce the collection of this tax the most arbitrary measures are often employed. The property of defaulters may be seized and sold in a moment; such as axes, knives, nets, guns, kettles, or the clothing of the family; and it has often happened that the poor natives are ruined by the illegal dues added to this tax by the collectors. There are other oppressions to which the inhabitants are liable, namely, forced and gratuitous services, such as forwarding of the post, the transport of flour and salt, and the forced levies of horses or dogs to officers and favourites. Any favourite or officer, who may wish to trade, is furnished with a free billet, which authorizes him, on the plea of public duty, to call out any supply of men and dogs that he may deem expedient; and besides this, he may purchase as many sables as the poor native happens to possess, and at any price which he himself chooses to fix.

The trade carried on with Russia consists in the exchange of furs for such articles as are in demand amongst the inhabitants. Captain Cochrane estimates the annual number of animals caught in the peninsula at 30,000, worth at least 200,000 rubles, or L.10,000. For these are received bread, flour, oatmeal, tea, sugar, tobacco, coarse cottons, nankeens, ribbons, handkerchiefs, &c.; woollens, linens, axes, knives, kettles, twine, &c. But the article most desired by the inhabitants, and which is ruinous alike to their morals and their health, is spirits, supplied to them by the Russian traders. For a glass of spirits these miserable creatures will sell the last sable they are possessed of. No less than 16,000 bottles of this pernicious stuff are consumed in the short period of three or four months, by 600 or 700 people, and at a most exorbitant price. This, with the introduction of European vices, carrying with them the seeds of other diseases, has contributed greatly to the desolation of the country. The population was greatly thinned by continual wars and insurrections; and these were followed by the introduction of the small-pox, which, in the year 1768, carried off no less than 6000 persons. Vaccination has been introduced, but a want of vaccinating matter has prevented this improvement from being generally introduced. St Peter's and St Paul's is the chief city of Kamtschatka, which contains forty-two dwellings, besides fifteen edifices belonging to the government, an old church, and the foundation of a new one. There is a school in this place, governed by a priest and a regular schoolmaster; but they are neither of them highly qualified for their duties. The children of the natives receive no education, and the children of the Russians but little more. The number of convicts who are sent here is also a serious grievance, as they obtain an ascendency over the natives, which is exercised in a most intolerant and infamous manner. They frequently desert, and commit every species of villany and outrage, even to the fomenting of insurrections.

Kamtschatka has been divided, since 1783, into four districts: 1*st*, Bolcheretsk; 2*d*, Tiguilok; 3*d*, Nijni Kamtschatsk; 4*th*, Verschnei Kamtschatsk. Since 1802 a commandant-general or governor has been appointed over the peninsula, who formerly resided at Versehnei Kamtschatsk, but has since been removed to St Peter's and St Paul's, and is, says Cochrane, again to be removed. According to his account, no improvement can be brought about in the condition of this desolate country, as long as its governors are sent for five years only. The general mode of occupying the allotted term, he adds, is for the first year to look about and to form plans for the improvement of the country, the second is passed in making reports, stating opinions; the third year brings the reply of the government, directing or authorizing the mode of administration; the fourth is employed in preparing, or at most in acting upon, such orders; and the fifth and last year in preparing to return to Europe, and in levying a parting contribution; the whole five years being indeed taken up more or less with accumulating as much money as possible. The population of Kamtschatka, according to the last census, amounts to 2208 Kamtschadales, 498 Koriaks, and 1260 Russians, amounting, along with the addition of other straggling hordes, to 4574 men, women, and children. (F.)

Islands in the Sea of KAMTSCHATKA. See ALEUTIAN ISLANDS.

KAN, or KHAN, the name of an officer in the East, answering to that of governor in Europe. There are khans of provinces, countries, and cities, who have different additions to distinguish them.

KANANY, a group of small uninhabited islands in the Eastern Seas, lying off the north coast of Mysol, about the 130th degree of east longitude. Good water may be procured at the south end of the great island. These islands produce a species of nut, full of oil, and about the size of a small almond. The north point of the principal island is fixed in long. 129. 36. E. and lat. 1. 47. S.

KAN-CHOO-FOO, a city of China, of the first rank, in the province of Kiangsi, situated at the confluence of two rivers, one of which has very high banks. A bridge of boats, fastened with iron chains, crosses these rivers at the union of their streams; and a stone quay extends for some distance, with handsome landing places. This town includes twelve others in its jurisdiction, and its neighbourhood produces abundantly the varnish trees. Long. 114. 30. E. Lat. 25. 52. N.

KANDAHAR. See CANDAHAR.

KANDERN, a town, the capital of a bailiwick of the same name, in the circle of the Treisam, in the duchy of Baden. The bailiwick contains, besides the town, fifty-four villages and hamlets, and 12,800 inhabitants. The town is situated on the river Kandern, has some considerable iron-works, and contains 144 houses and 1527 inhabitants.

KANGAROO ISLAND is situated on the south coast of Holland. It was discovered by Captain Flinders, and was so called from the great number of kangaroos found on the island, which were so tame that they suffered themselves to be knocked down with spikes. The soil, as far as it was examined by Captain Flinders, appeared to be fertile, and the country was covered with a thick wood. Long. of Kangaroo Head, 137. 58. E. Lat. 35. 43. S.

KANGELANG ISLE, an island of a very irregular shape, and surrounded by a cluster of smaller ones, with innumerable shoals. The principal island is twenty-five miles long by eight in average breadth. It is situated between the sixth and seventh degrees of south latitude, and the 115th and 116th of east longitude.

KANGRAH, called also Catochin, a district of Hindustan, in the province of Lahore. It is bounded on the north and north-west by Hurreepoor, on the east by Chambay, on the south by Calour, and on the west by the Punjab, being situated to the south-west of the Himalaya Mountains, between the Beyah and the Rauvy Rivers. The country is covered with wood. The fortress of Kangrah, which is situated in the northern part of the province, has long been celebrated. It was taken, A. D. 1010, by the famous Mahmoud of Ghizni, who plundered it of immense riches. It was retaken by the rajah of Delhi in 1043; and afterwards by the Emperor Akbar, after a very long siege, who conferred it on one of his officers, with the adjoining district. From him the present possessors of the lands boast their descent. It is situated on the top of a steep mountain, is well supplied with water, and contains ample space for raising supplies to feed a numerous garrison. Like all the other hill-forts in India, it is very unhealthy. Long. 75. 50. E. Lat. 32. 20. N.

KANIJEE, a small town of Hindustan, in the province of Gujerat, situated a few miles north from Rahdunpoor. It contains about 250 houses, and is surrounded by a ditch eight feet deep, and a good parapet.

KANKHO, or KANKIANG-HO, a large river of China, in the province of Kiangsi. Its course is from north to south, and it falls into the Poyang Lake, forming the termination of the great water communication reaching from Pekin southwards for upwards of 1000 miles. It has a rocky bed, and the navigation is sometimes dangerous.

KANOGE, a town and district of Hindustan, in the province of Agra. The district extends along the east side

Kanoge. Kant.

of the Ganges, and is generally of a sandy soil, though well cultivated. The town is of great antiquity and celebrity, about two miles distant from the Ganges, with which it communicates by a canal. It was in former times of much greater extent and magnificence; and, for an extent of about six miles, the small pieces of brick which are seen on the spot, and the occasional traces of building, mark out the site of the ancient capital of Hindustan. The town at present consists of but one street; there are no buildings of any consequence; and the brick walls, which appear of no great antiquity, are going rapidly to decay. The adjacent plain is covered with ruined temples and tombs, and everywhere broken images are seen lying under the trees. The most curious remains of antiquity are often found amongst the ruins, such as ancient coins, inscribed with Sanscrit characters, and sometimes with the figure of a Hindu deity on one side. Kanoge was the capital of a powerful empire which existed at the period of the Mahommedan invasion. It was conquered, though not permanently retained, by Mahmoud of Ghizni, A. D. 1018. The travelling distance from Agra is 217 miles; from Lucknow, seventy-five miles; from Delhi, 214; and from Calcutta, 719. Long. 79. 52. E. Lat. 27. 5. N.

KANT, IMMANUEL, a very eminent metaphysician, and the author of that theory which has been distinguished by the name of the *Critical* or *Transcendental Philosophy*, was born at Königsberg, in Prussia, on the 22d of April 1724. Of his paternal ancestors little is known with certainty; but tradition represents them as having sprung from an emigrant Scotchman of the name of Cant; and the philosopher himself, who frequently alluded to this traditionary extraction, is said to have been the first of his family who changed the initial letter of his name to K, with a view to adapt it to the German pronunciation.

The father of Kant, who exercised the humble profession of a saddler or harness-maker, in the suburbs of Königsberg, was distinguished rather for his integrity and respectability than for his wealth. His mother appears to have been a woman of considerable talent, and of a more decided character. She was exceedingly pious, and much attached to the strict religious tenets and discipline of Dr Schultz, a divine who at that period enjoyed a high reputation for learning, eloquence, and piety.[1] Kant uniformly spoke of both his parents, but especially of his mother, with feelings of the warmest affection.[2]

Although far from being in affluent circumstances, his parents resolved to bestow upon their son Immanuel every advantage that could result from a liberal education. Accordingly, after having been taught to read and write at the charity school of the suburbs, he was sent, in the year 1732, to the *Collegium Fridericianum*, at the suggestion, it is believed, of Dr Schultz, who, even at that early period, had the penetration to discover the talents of the boy. At this school he contracted an intimate friendship with Ruhnkenius, afterwards so celebrated for his philological attainments, which was maintained by occasional correspondence during the remainder of their lives, and which, in their early years, may naturally be supposed to have had a salutary influence on the studies of both. They were both indefatigable students; and they not only mutually assisted each other in their school exercises, but read together, during their leisure hours, whatever books their inclination led them to peruse, or their circumstances permitted them to purchase. It is rather a remarkable circumstance, however, that at this early period Kant devoted his attention principally to philological studies; whilst his friend Ruhnkenius seemed to be attracted, by an apparently natural tendency of disposition, to the cultivation of philosophy. In their maturer years, as is well known, these early predilections were precisely reversed.[3]

Having completed his preliminary education, he repaired, in the year 1740, to the university of his native town, where he applied himself with great ardour to the study of the mathematical, philosophical, and theological sciences. Amongst the professors of Königsberg, several of whom were men of considerable talents and attainments, he appears to have attached himself particularly to Professor Martin Knutzen, well known, at that period, as the author of several useful works, to whose instructions in mathematics and philosophy Kant acknowledged himself to have been greatly indebted.[4] To the great diligence and success with which he prosecuted his studies at this period, his early writings bear ample testimony. The youth who, at the age of twenty-two, could boldly and successfully impugn the doctrines of Leibnitz and Wolf, and skilfully wield the weapons of dialectics against the authority of the most eminent metaphysicians of his day, must have bestowed no common pains in the acquisition of scientific knowledge, and in cultivating the powers of his understanding. From the earliest period of his career, too, he was left almost entirely to the resources of his own talents and prudence, and compelled, at every step, to struggle against the depressing influence of poverty. When scarcely arrived at manhood, he had the misfortune to lose both his parents, who had not the satisfaction of living to witness the fruits of their son's talents and industry. They, indeed, had never been able to afford him much pecuniary assistance; but he was fortunate in meeting with some relations of his family, who were in more affluent circumstances, and by whose liberality, combined with his own exertions and economy, he was enabled to continue the prosecution of his studies.

After a residence of about three years at the university, he acted in the capacity of private tutor in several families, and lived about nine years with the Count de Hüllesen at Arnsdorf. During this period he embraced the opportunities which his retirement afforded him, of collecting a vast store of general knowledge in almost every department of science and literature, and of sketching the outlines of several of those philosophical treatises, which were soon afterwards published in rapid succession.

It is rather unfortunate that no record seems to have been preserved of the course of his studies during this most interesting period of his life; nor has he himself, so far as we know, left any memorials which might enable us to trace the gradual progress of his mind in the acquisition of knowledge. It is certain, however, that he both read and thought much. According to his own confession, he was not particularly well qualified to discharge the duties of a tutor; being always too deeply engaged in acquiring and digesting knowledge in his own mind, to be capable of communicating the rudiments of it to others. His mind seems to have originally entertained a strong bias towards mathematical and physical researches; and

---

[1] He was professor of theology at the university of Königsberg, and the author of several works which were much esteemed in their day; amongst others, of a work on the *Elements of Metaphysical Science*.

[2] Kant had several sisters, and an only brother several years younger than himself, who took orders, and had a living in Courland, where he continued to reside until his death.

[3] Throughout every period of his life, however, Kant retained a great fondness for classical literature. He was particularly partial to the study of the Roman writers; and, even in his old age, he delighted to have an opportunity of reciting and applying passages from the works of his favourite authors.

[4] Knutzen died in the year 1756, as extraordinary professor of philosophy at Königsberg.

he exhibited some specimens of knowledge, acuteness, and originality of investigation, in the latter branch of science, from which much eminence might have resulted had his views been exclusively confined to that department.

It was probably during the period of his retirement at Arnsdorf that he was led to engage in a laborious investigation of the various metaphysical theories of ancient and modern times. With this view, he made himself master of the living languages, especially the French and English, the latter of which he acquired without the aid of a master, in order to enable him to examine into the merits of the British philosophers, particularly Locke, Berkeley, and Hume. To the sceptical conclusions of the last-mentioned writer, according to Kant's own confession, the world is indebted for the *Critical Theory*.

Having attained his thirtieth year, and already distinguished himself as the author of several tracts, exhibiting great originality of thought, Kant resolved to devote himself to the profession of public teacher. With this view, he returned to the university of Königsberg, and took his degree of master of arts, according to the usual forms, in the year 1755. It was upon this occasion that he produced, in the form of an inaugural dissertation, his tract entitled *Principiorum primorum Cognitionis Metaphysicæ nova dilucidatio;* the first of his works, it is believed, which contained any hints respecting his peculiar views of metaphysical science. In the same year he published his celebrated treatise on the *Universal Natural History and Theory of the Heavens; or an Essay on the Constitution and Mechanical Structure of the whole Globe, according to the Newtonian System.* In this treatise, by following out the principles of Newton, he was led to anticipate, in theory, some of the subsequent discoveries of the great practical astronomer Herschel.

Soon after he had taken his degree, he began to avail himself of the privilege attached to the character of a *Doctor docens*, by delivering lectures publicly on logic, metaphysics, mathematics, and natural philosophy; to which, at a subsequent period, he added the law of nature, moral philosophy, natural theology, and physical geography. He had not long commenced the discharge of his duties as a public teacher, when the concourse of students, whom the reputation of his profound and extensive learning attracted, was so great, that his *auditorium*, or lecture-room, although large and commodious, could scarcely contain the numbers who eagerly flocked to hear him. His affable manners and social talents, at the same time, rendered him a most acceptable guest at the tables of the most respectable inhabitants of Königsberg, with several of whom he lived on habits of intimate friendship.

But notwithstanding his acknowledged talents as a philosopher, and his popularity as a lecturer on scientific subjects, it was long before Kant obtained any preferment. With a mind constantly and intensely engaged in the pursuit of knowledge, he appears to have possessed no ambition beyond that of being useful in the sphere he had chosen for the exercise of his abilities; and he had too much simplicity of character to resort to any of those arts by which other men, more emulous of distinction, frequently endeavour to advance their worldly interests. Upon the death of Knutzen, in the month of April 1756, he solicited the vacant extraordinary professorship of philosophy, but without success. The ordinary professor of logic and metaphysics having died in 1758, Dr Schultz, who, as we have already observed, discovered at an early period the talents of Kant, and continued to patronise him so long as he lived, exerted all his influence to obtain that situation for his *protegé*. But Kant was again disappointed. Not discouraged, however, by the repeated failure of his attempts to attain independence, he continued to deliver his lectures, and to meditate his writings. In the month of February 1766 he accepted the unsolicited situation of second keeper of the royal library, to which a small salary was attached; and at the same time he undertook the management of a private cabinet of curiosities. But these offices he resigned in 1772, on account of the interruptions to which he was exposed in showing the books and rarities to strangers.

In the year 1770, Kant at length attained the highest object of his ambition, on his advancement to the ordinary professorship of logic and metaphysics in the university of Königsberg; a situation which, while it placed him far above the fear of want, afforded him, at the same time, the best opportunity of employing his talents in a manner satisfactory to himself and advantageous to his country. Upon this occasion, he produced his celebrated inaugural dissertation, *De Mundi Sensibilis atque Intelligibilis Forma et Principiis*, in which he propounded some of the fundamental principles of that metaphysical theory to which he was afterwards indebted for his great reputation.

From this period, the life of Kant affords no very remarkable incidents for the pen of the biographer. His time appears to have been chiefly occupied in the faithful and zealous discharge of the duties of his office; in the composition of those philosophical works, by which he hoped to accomplish an important and beneficial reform in metaphysical science; and in cultivating the society of a select number of friends. At this time, too, he maintained a philosophical correspondence with several of the first literary characters of the age, and particularly with the celebrated Lambert, then president of the Royal Academy of Sciences at Berlin, whose views of philosophy were, in some respects, coincident with his own. His letters to Lambert, indeed, are peculiarly interesting, as they contain frequent allusions to the gradual development of his metaphysical ideas.

In the year 1780, he became a member of the *Senatus Academicus;* and in 1787 he was admitted a member of the Royal Academy of Sciences at Berlin. Never, perhaps, did there exist a mind so ardently and so entirely devoted to the cultivation of science, and so utterly divested of all interested motives in the pursuit of knowledge. Having once attained independence, his ambition, as to worldly objects, seems to have aspired no higher. Although he received, at different times, various invitations, with most advantageous proposals, to induce him to transfer his talents and his reputation to other universities, he could never be prevailed upon to leave his native town; being perfectly satisfied with the advantages he already enjoyed, and with the sphere of usefulness which had been assigned him. For many years previous to his death, he was the senior professor of Königsberg; and he enjoyed that high degree of respect and veneration which was due alike to his advanced age, his eminent talents, and conspicuous virtues. He died, by a gradual decay of nature, on the 12th of February 1804, in the eightieth year of his age. His funeral was attended by the most respectable inhabitants of Königsberg, and by a numerous train of his friends and disciples; and, to express the public regret for the loss of so distinguished a character, the whole city put on mourning. On his coffin there was placed a sepulchral urn, with the inscription, *Cineres mortales immortalis Kantii.* A beautiful commemorative medal was also executed upon this occasion, by M. Abramson of Berlin. On one side is a striking likeness of the philosopher, with the inscription, *Immanuel Kant, nat.* 1724. On the reverse, the artist has attempted to express the services of Kant in assigning limits to the province of speculative philosophy, by representing a Minerva seated, and holding an owl in her right hand, which she prevents from flying, with the inscription, *Altius volantem arcuit.*

In his person, Kant was rather below the middle stature, of a slender and delicate form, and with a very narrow and flat chest. His bodily frame, indeed, did not seem to promise longevity; nor would he, in all probability, have attained so great an age, had not his constitution been preserved by his regular and temperate mode of living. In his external appearance, strangers found nothing prepossessing, or indicative of any uncommon talents; on the contrary, his features are represented by a gentleman who visited him at Königsberg, as "a reproach to physiognomy." Others, however, describe his countenance as full of dignity, and expressive of benevolence. His natural disposition was cheerful and social, and his manners were polite and affable. He exhibited none of that awkwardness or reserve which is frequently generated or increased by habits of recluse meditation, and which is often thought to be characteristic of the scholar and man of science. He loved company, and was both inquisitive himself, and fond of communicating his own knowledge and opinions upon all subjects. There was nothing, however trifling it might appear at first sight, which did not suggest to his mind some interesting reflections; and he could talk as fluently with a lady on the minutiæ of female dress, the mysteries of the kitchen, or the common occurrences of the day, as he could with a philosopher on the most abstruse points of science. He was very regular in his habits. He rose early, and his mornings were generally devoted to study and professional duties, his evenings to society. As he never entered into the married state, he was not encumbered with the cares of a family. He used to say, that when he would have married, he had not fortune sufficient to maintain a wife; and when he possessed the requisite fortune, he had no inclination to marry. It has been remarked that he was fond of society; and during the earlier part of his life, when otherwise disengaged, he used to dine at the ordinary of the principal tavern, by which means he had an opportunity of acquiring an extensive knowledge of human character, and, at the same time, of gratifying his inquisitive disposition, by eliciting from travellers of different countries many curious and valuable observations on the manners, habits, and literature of various nations. He possessed an intimate knowledge of geography, and even of minute topography, probably in a great measure derived from this last-mentioned source, as well as from his private reading of books of travels, to which he was always extremely partial; and he frequently entered into local details with a degree of correctness which could not fail to astonish those who learned that he had never moved fifty miles from his native town. At a later period of his life, when more easy in his circumstances, he generally invited a few of his friends to dinner, with whom he relaxed from his graver studies, frequently enlivening his discourse with sallies of wit and humour, of which he possessed no small share, and occasional irony and satire, of that good-natured species which inflicts no wound on the object against whom it is directed.

Kant's intellectual faculties were of a high order. He had a wonderful power of reflection, which enabled him to unfold the most abstruse principles, and to pursue, in his own mind, a long train of conclusions. He possessed great quickness of observation, and clearness of conception; insomuch that, in conversation, he could describe any object which he had seen, or of which he had read, with admirable precision and accuracy. His memory was exceedingly retentive. He kept no library, but made a contract with a bookseller to send him all new publications, which he perused, and afterwards returned; and the knowledge thus acquired he had always at his command. The most remarkable feature in the moral character of Kant was an utter abhorrence of every species of falsehood, however innocent, and a love of perfect honesty and sincerity in word and action, flowing no less from his natural disposition, than from those high principles which he had early imbibed, of the value of truth, and the dignity of man. In this respect he was ever consistent with himself; and the whole tenor of his long life may be regarded as a practical commentary on his writings, and an exemplification of his moral maxims.

The peculiar doctrines of the critical or transcendental philosophy were not the offspring of impressions accidentally received, and hastily adopted, but the fruit of long, patient, and systematic investigation. Kant, indeed, was well advanced in years before he attempted that reform in metaphysical science which he seems to have long meditated. In several of his earlier productions, and in his letters to Lambert, he evidently appears to have been dissatisfied with the prevailing theories; and his inaugural dissertations, as already mentioned, exhibited some of those peculiar views, which were afterwards more fully developed in his great work, the *Critik der reinen Vernunft.* This work was published in 1781. For several years it appears to have attracted little or no attention; and the publisher, it is said, was on the point of destroying the sheets as waste paper, when a sudden demand rapidly carried off several impressions. From that period, the *Transcendental Theory* began to excite an extraordinary sensation, and to be regarded as a new and wonderful discovery in metaphysical science; the philosophers of Germany were divided into professed partisans and determined antagonists of the doctrines of Kant; and a multitude of publications issued yearly from the press, for the purpose of confirming or refuting the new principles.

It was not long, however, before the *Critical Philosophy* bore down all opposition, and obtained a complete ascendency over the theories inculcated by its adversaries. It was publicly taught in the schools, to the almost total exclusion of the doctrines of Aristotle, Descartes, Locke, Leibnitz, and Wolf; it gave a fresh impulse to the spirit of metaphysical inquiry; and men of the first note in the scientific world felt a conscious pride in being able to comprehend, to explain, to illustrate, to apply, or to extend its principles. It not only effected an entire revolution in German metaphysics, but exerted a powerful influence on works of taste, and the lighter literature of the country. It is impossible, indeed, to comprehend, or to relish, many passages in the works of the more recent poets, novelists, and fugitive writers of Germany, without some previous acquaintance with the doctrines of Kant.

Owing to what has been already said upon the subject in another part of this work,[1] we shall avoid entering into any discussion respecting the merits of the *Critical Philosophy* in the present article; but we shall present our readers with a very concise abstract of its objects and results.

Mr Hume proved very satisfactorily, that our ideas of *cause and effect* are not derived from experience; but he rashly concluded, as Kant observes, "that they are the spurious offspring of the imagination impregnated by custom." Kant discovered that Hume had been led to this hasty inference in consequence of having taken too limited a view of the great problem which he had thus partially attempted to solve. He perceived that the idea of *cause and effect* is by no means the only one which the mind makes use of with the consciousness of its necessity, yet without being derived from experience; but that the science of metaphysics is altogether founded on ideas of a similar nature. He endeavoured, therefore, to ascertain the precise number of these abstract or transcendental ideas; and having succeeded in this to his own satisfaction, he

[1] See *Dissertation First*, Part Second, Section Seventh.

found himself in possession of the whole of those connecting acts of the mind, which constitute the very elements of the understanding itself, which are indispensable to its exercise, and without which the whole of our experience would exhibit nothing but a number of insulated facts, without order or consistency.

The three original faculties, through the medium of which we acquire knowledge, are, *sense*, *understanding*, and *reason*. *Sense* is a passive or receptive faculty. In the objects presented to our senses, we distinguish *matter* and *form*. The forms or conditions of sense are *space* and *time*; the former of the external, the latter of the internal sense. All our knowledge is limited by space and time; for we can perceive nothing that does not exist under these conditions.

Understanding is an active or spontaneous faculty, and consists in the power of forming conceptions. In every conception of the understanding, also, we distinguish the *matter* and the *form*. The matter is the sensible intuition; the form is the unity, or connection, established by means of the synthetic powers of the understanding, or the categories. Kant was at great pains in endeavouring to ascertain the number of these synthetic powers or categories; and he found them to be all comprehended under the four classes of *quantity*, *quality*, *relation*, and *modality*. The categories themselves are twelve in number. Under the first head are comprised *unity*, *multitude*, *totality*; under the second, *reality*, *negation*, *limitation*; under the third, *substance* and *accident*, *cause* and *effect*, *action* and *re-action*; under the fourth, *possibility*, *existence*, *necessity*.

This synthetic power of the understanding is called, in the critical philosophy, its *original* use. The *logical* use, both of understanding and reason, is to be found in the faculty of *judgment*. Logic, however, has only to do with the form of our conceptions, and not with their matter; which last inquiry belongs to transcendental philosophy, or metaphysics.

Reason is the third or highest degree of mental spontaneity, and consists in the power of forming ideas. As it is the province of the understanding to form the intuitions of sense into conceptions, so it is the business of reason to form conceptions into ideas. The ideas of reason are absolute and unconditional, and totally independent of space or time; consequently, we can neither obtain nor extend our knowledge by means of reason alone. For these ideas are nothing more than certain representations of the unconditional, that is, of the highest unity and totality, which spring from the essential constitution of our reason, which serve to render the field of experience a comprehensible whole, and which, therefore, are merely conditions of the exercise of our reason, and not real external objects of which it is possible to acquire any knowledge by intuition.

The results of the critical theory may be stated, we conceive, in a very few words. The first principles, or conditions, of our speculative knowledge, are mere *subjective* forms, or forms derived from the constitution of the thinking being: First, the forms of sense, or pure intuitions (space and time); and, secondly, the forms or notions of the understanding (the categories). These intellectual forms or notions, however, only acquire reality by their application to our perceptions, with reference to possible experience, and therefore we can have no speculative knowledge of things beyond the sphere of experience.

Besides the critical investigation of pure reason in its speculative exercise, Kant instituted a similar inquiry into the nature and laws of our *practical reason*, and of the faculty of *judgment*; and, in the spirit of his own theory, he published the *Metaphysical Elements of Natural Philosophy*, of *Law*, and of *Ethics*. His *Logic*, *Physical Geography*, and some other works, were published by his friends, from his papers, and the marginal notes to his text-books. Towards the latter end of his life, he meditated a work, which was intended to be the key-stone of his whole system, and which was to have been entitled *The Transition from Metaphysics to Physics*; in which he proposed to demonstrate the general application of the principles of the transcendental theory. The decline of his faculties, however, prevented the execution of this projected work.

We shall close this article with a list of Kant's publications.

Gedanken von der wahren Schätzung der lebendigen Kräfte, &c. (Thoughts on the true estimation of the animal powers, with strictures on the proofs advanced by Leibnitz and others.) Königsberg, 1746.

Allgemeine Naturgeschichte und Theorie des Himmels, &c. (Universal Natural History and Theory of the Heavens, &c.) Ibid. 1755.

Principiorum primorum Cognitionis Metaphysicæ nova dilucidatio. A Dissertation on taking his master's degree, in 1755.

Betrachtungen über den Optimism. (Reflections on Optimism.) Königsberg, 1759.

Von der falschen Spitzfindigkeit der vier syllogistischen Figuren. (On the sophistical subtilty of the four syllogistic figures.) 1763.

Einzig möglicher Beweisgrund zu einer Demonstration des Daseyns Gottes. (The only possible evidence for demonstrating the existence of the Deity.) Königsberg, 1763.

Beobachtungen über das Gefühl des Schönen und Erhabenen. (Observations on the feeling of the Beautiful and Sublime.) 1764. This tract is remarkable on account of the spirit of humour and pleasantry which pervades it.

Träume eines Geistersehers, erläutert durch Träume der Metaphysik. (Dreams of a Ghost-seer, illustrated by the dreams of Metaphysics.) Riga, 1766. This publication was occasioned by the visions of the famous Emanuel Swedenborg.

De Mundi Sensibilis atque Intelligibilis Forma et Principiis. Königsberg, 1770. An inaugural dissertation on obtaining his professorship.

These, along with a number of other tracts, in which the author displayed an intimate acquaintance with the principles of the sciences, remarkable quickness of observation, great depth of thought and acuteness of reasoning, will be found incorporated in the following collections.

Kant's Sämmtliche kleine Schriften. (Kant's Smaller Tracts collected.) 3 vols. 8vo. Königsberg and Leipsic, 1797.

Kant's Vermischte Schriften, mit Anmerkungen, von Tieftrunk. (Kant's Miscellaneous Writings, with Notes, published by Tieftrunk.) 3 vols. 8vo. Halle, 1799. A fourth volume was added, Königsberg, 1807.

The early and anonymous essays of Kant were collected and published by F. T. Rink, Königsberg, 1800. In the following works, his peculiar views of metaphysical science, as constituting what has been called the Critical Philosophy, are more fully and systematically developed.

Critik der Reinen Vernunft. (Critical inquiry into the Nature of Pure Reason.) Riga, 1781; 3d ed. 1791, 8vo.

Prolegomena zu einer jeden künftigen Metaphysik, &c. (Prolegomena to every Future System of Metaphysics, &c.) 1783. In the Critik der reinen Vernunft, the author had proceeded synthetically; in this other work he adopts the analytical method, with the view of rendering his theory more intelligible to students.

Metaphysische Anfangsgründe der Naturwissenschaft. (Metaphysical Elements of Natural Philosophy,) 1786. This is a systematic text-book on pure physics, in which the author treats of those principles in natural philosophy of whose truth we are conscious *a priori*, *i. e.* independently of experience. The subject is treated under the four heads of Phoronomy, Dynamics, Mechanics, and Phenomenology.

Grundlegung zur Metaphysik der Sitten. (Fundamental Principles of the Metaphysics of Morals.) 1785.

Critik der Practischen Vernunft. (A Critical Inquiry into the Nature and Laws of Practical Reason.) 1788.

Critik der Urtheilskraft. (A Critical Inquiry into the Faculty of Judgment.) 1790. In this work the author developes his views of the principles of taste.

Metaphysische Anfangsgründe der Rechtslehre. (Metaphysical Elements of Legal Science.) 1797.

Metaphysische Anfangsgründe der Tugendlehre. (Metaphysical Elements of Ethics.) 1797.

Anthropologie, in Pragmatischer Hinsicht. (A Pragmatical Treatise on Anthropology.) 1798.

The following works were published from his papers by his friends:

Logik (Logic), published by G. B. Iäsche, 1801.

Physische Geographie (Physical Geography), of which, we believe, there have been several editions by different editors.

Pädagogik (Pædagogics, or the Art of communicating Instruction.) Published by F. T. Rink, 1803. (K.)

KANTCHEOU, a large town of China, situated near the north-western extremity of the country, where it projects into Tartary. It appears to be the place called Campion by Marco Polo and other early travellers.

KAO, one of the Friendly Islands, in the South Pacific Ocean, called also Aghao, or Oghao. It is two miles north-east of Toofoa, and is a mountainous rock. In the channel which separates it from Toofoa, Captain Cook found no soundings.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain. A quantity of this earth was brought from China, and examined by M. Reaumur. He found that it was perfectly infusible by fire, and believed that it was a talky earth; but M. Macquer conceives that it is more probably of an argillaceous nature, from its forming a tenacious paste with the other ingredient, called *petuntse*, which has no tenacity. M. Bomare says, that by analyzing some Chinese kaolin, he found it to be a compound earth, consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a meally appearance; of sparkling crystals of mica; and of small gravel, or particles of quartz crystals. He says that he has found a similar earth upon a stratum of granite, and conjectures that it may be a decomposed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites.

KAOMING-SZE, a city of China, in the province of Kiangnan, situated on the great canal. It is distinguished by a very ancient and splendid pagoda dedicated to the god Fo. It is sixty-five miles north-east of Nanking.

KAOTCHEOUFOU, a city of China, of the first rank, in the province of Quangtong, situated on a river, thirty-six miles from the sea. It is 200 miles east-south-east of Canton. Long. 110. 4. E. Lat. 21. 40. N.

KAPINI, a small, uninhabited island, about twenty-five miles in circumference, lying off the west coast of Sumatra, and situated almost immediately under the equator. In the charts it is usually named Batu, whilst this latter island is erroneously named Mintaon.

KAPUVAR, a town of the province of Farther Danube, in the Austrian kingdom of Hungary, on an arm of the river Raab, where there is a magnificent castle belonging to Prince Esterhazy. It contains 2943 inhabitants, with one Catholic church. Much tobacco is cultivated around the town.

KARAH, a town of Hindustan, belonging to the Mahrattas, in the province of Gujerat, 17 miles south-east from Ahmedabad. Long. 72. 45. E. Lat. 22. 46. N.

KARAK, an island in the Persian Gulf, the greater part of which is rocky; but the eastern part, being somewhat lower than the others, is capable of being cultivated. It was formerly under the Dutch, when it contained from 2000 to 3000 inhabitants. At present it does not contain above 300 or 400. It affords a safe anchorage at all seasons, but more particularly during the severe gales which blow from the north-west, and are the prevailing winds in this sea. In the year 1808, Sir John Malcolm recommended to the British government to occupy this island, as a defensive position, and a good station for trade, which might be securely carried on with the neighbouring coasts of Persia and Arabia. The Persians are in possession of this island at present. A good supply of water may be procured here, and also the best pilots for Bassorah. Lat. 29. 14. N.

KARAKALPACS, a people of Tartary, who inhabit that tract of country which lies to the east of the Aral, and to the north of the Sihon or Jaxartes. They profess the Mahommedan faith, and are chiefly employed in agriculture, the soil of the country possessing a considerable degree of fertility. The country is under the dominion of khans; but the Seits, the supposed descendants of Mahommed, receive more respect than their princes. The Russians protect them against the incursions of their neighbours the Kirghises.

KARAKITA, a small island in the Eastern Seas, to the south of Sangir, about six miles in circumference. It is cultivated and inhabited. Long. 125. 25. E. Lat. 3. 7. N.

KARANG SAMBONG, a considerable inland town of the island of Java, situated upon a fine river, which is navigable for large prows, and runs through Indramayo into the sea. It is 168 miles south-east from Batavia.

KARASJEE, a small town of Hindustan, in the province of Bejapoor. It contains a number of Mahommedans, who subsist mostly on alms, in a state of filth and sloth. Long. 75. 28. E. Lat. 17. 26. N.

KARASUBASAR, a city of the province of Taurien or Taurida, in Russia, in the circle of Feodosia. It stands in a plain between two mountains, upon the banks of the river Karask. It contains 915 houses in narrow streets, and 3700 inhabitants, consisting of Tartars, Greeks, Armenians, and some Jews, with but few Russians. It has considerable trade in leather, soap, candles, and tallow. Long. 34. 30. E. Lat. 45. 4. N.

KARATSCHEW, a city of the province of Orel, in Russia, the capital of a circle of the same name. It stands on the river Sujeshat. It contains twelve churches, three of which are of stone, 1000 houses, and 6230 inhabitants, who make large quantities of twine and ropes. Long. 34. 51. E. Lat. 53. 16. N.

KARDANAH, a river of Palestine, anciently called Belus, the sand of which has long been celebrated in the manufacture of glass. It falls into the Mediterranean, eight miles south of Acre.

KARGAUW, a town of Hindustan, in the Mahratta territories, in the province of Khandesh, district of Bejapoor. Long. 75. 35. E. Lat. 21. 54. N.

KARGAPOL, a city of the Russian province Olonez, the capital of a circle of the same name, extending over fifty-four square miles, and containing 44,500 inhabitants. The city is built on the river Onega, and is one of the most respectable provincial towns of Russia. It contains seventeen stone and nine wooden churches, two convents, 520 other dwellings, and 3700 inhabitants, who are very active and enterprising. Long. 38. 45. E. Lat. 61. 29. N.

KARICAL, a town of Hindustan, on the sea-coast of the province of Tanjore, fifty miles east by north from the province of Tanjore. The surrounding territory produces rice and salt. Karical was granted to the French by the rajah of Travancore in 1739. The fort is built upon one of the branches of the Cavery, the mouth of which is so choked by a bank of sand, that it is only navigable for boats. In 1760, Karical was taken from the French by Colonel Monson. It has been frequently taken and retaken since that period by the contending parties, and was ceded to the French at the conclusion of the last war. Long. 79. 54. E. Lat. 10. 55. N.

KARLE, a Saxon term, used in our law, sometimes to signify simply a man; and sometimes, with an addition, a servant or clown. Thus the Saxons call a seaman *buscarli*, and a domestic servant *huscarle*. Hence comes the modern word *churl*.

KARLSBAD. This is one of the most celebrated bathing places in Europe. It is situated in Bohemia, on the northern boundary towards Saxony. It is in a narrow and deep valley in a mountainous district, abounding with many most romantic prospects, and stands on both sides of the river Tepel. The springs are said to have been discovered in the year 1358, by the emperor of Germany, Charles IV., whilst hunting; and, the virtues of the water having been ascertained, he built a castle on the spot, around which other edifices were subsequently erected, and thus formed a city. It now contains about 500 houses, with 3000 resident inhabitants; but, in the summer, the number of occasional visitors far exceeds this. It has a neat and well-built church, an elegant theatre, and several spacious halls for assemblies collected for music, dancing, or promenading. The company to be found at this place is of the most promiscuous kind; and monarchs, nobles, and the most distinguished persons on the continent, mix here with the other guests with no observable parade or ceremony. The walks that have been laid out display much taste, and, from several points in them, the prospects are very striking; whilst the number of retreats, where refreshments are furnished, are appropriate, and at very moderate rates. The warm springs are of various names, viz. the Old and New Sprudel, the New Well, the Mill Well, the Bernharts Well, and the Theresa Well. All of these nearly resemble each other in taste, and the patients take very large doses of them. The cures in dyspepsia are much celebrated; and gouty, rheumatic, and scrofulous diseases are frequently cured by the use of the water. The resident inhabitants make many curious articles in iron, steel, tin, and wood, of which most of the visitors become the purchasers.

KARLSTADT, a city of Bavaria, the capital of the bailiwick of the same name, in the circle of the Upper Maine. It is built on the Maine, is surrounded with walls, and contains 460 houses, and 2280 inhabitants.

KARLSTADT, a circle of the Austrian Illyrian province of Trieste, extending over 1326 square miles, containing one city, two market-towns, and 514 villages and hamlets, with 22,400 houses, and 108,250 inhabitants. The whole circle is very mountainous, the southern part being a prolongation of the Alps, and the rest a series of woody mountains. Between the ranges are some extensive and fertile valleys, producing wine, olives, fruit, tobacco, corn, and good pasture. The chief city, which gives its name to the circle, stands on the river Kulp, is fortified, and contains one Greek and two Catholic churches, a Franciscan convent, 524 houses, and 3224 inhabitants, who are employed chiefly in building ships and boats. It is in long. 17. 32. 52. E. and lat. 45. 29. 33. N.

KARNAC, or KARNAK, the name of a village near Thebes, in Upper Egypt, and built on a small part of the site of a temple, which must have been one of the most magnificent in the world. The ruins of this edifice seem to indicate, according to Denon, that it was the largest ever raised by human hands; and he thinks it probable that this temple, as well as the palace of Luxor, was built in the time of Sesostris, called by the Egyptians the Great Rhamses, when Egypt was in the highest degree of prosperity. The plan of this temple is noble and grand; but Denon supposes that the embellishments were added long after the building of the temple, as they exhibit a more correct and chaste style. See article EGYPT.

KARNATA, an ancient Hindu geographical division, which comprehended all the high table-land in the south of India, situated above the Ghauts. The name has been transferred to the adjacent provinces on the sea-coasts of India, Carnatic, and Canara. In the remote periods of Hindu history, Karnata existed as a powerful empire, which comprehended great part of the south of India.

KAROON, a river of Persia, which has its rise about thirty-five miles south-west of Ispahan, at a place called Correng, at the foot of the same hill where the Zeindrood or Ispahan river has its source. After receiving a number of tributary streams in the mountains of Lauristan, it flows through the city of Shuster, to a small village twelve miles to the south of that city, where it meets the Abzal. It then flows with a southerly course as far as lat. 30. 32. N., and thirty miles east of Bassorah. Here it divides itself into two branches, one of which disembogues itself into the sea at Goban; and the other, taking the name of Hafur, after a course of about fourteen miles, again separates, one division passing through an artificial canal three miles in length, into the Shat-ul-Arab, and the other entering the sea by the name of Bamishire. "The Karoon," says Mr Kinneir, "is a noble river, being in many parts upwards of 300 yards in breadth, and navigable for boats of twenty-five tons burden as far as Kishtibund, four miles from Shuster.

KAROULY, a town and district of Hindustan, in the province of Agra, situated on the Putchpuree River, which, ducing the rainy season, swells to a torrent; and on the other side is surrounded by deep and extensive ravines. The town is surrounded by a good stone wall with bastions, and the fort is in the centre. The rajah is of the military tribe of the Rajpoots, who have been gradually stript of their best possessions by the Afghans, Moguls, and Mahrattas. It is seventy miles south-west from the city of Agra. Long. 77. E. Lat. 26. 35. N.

KARPOOT, a large and ancient town of Koordistan, built on the summit of a hill, at the eastern extremity of a fertile valley about three or four miles in breadth and about twenty-five in length. It belongs to the pasha of Maden, or inspector of the mines, who resides at Gebbin Maden, the silver mines on the Euphrates.

KARS, a city of Turkish Armenia, situated at the extremity of a fine valley. It is built on the side of an uneven rocky height, on the summit of which, to the eastward, rises its citadel, of great antiquity. The walls of the town extend in a straight line east and west along the plain; then run up the acclivity of the rock on each side till they reach its top, where, strongly protected with round and square bastions, they meet at the great towers of the fortress. It is a perfect and interesting specimen of an Asiatic fortified city. Beyond the walls, a considerable suburb stretches out eastward; but three or four pentagon batteries, each mounted with five pieces of cannon, appeared to Sir R. K. Porter, who visited this place in 1818, to be the sole defences of the outer town. Seen from a distance, the town has a majestic appearance, from the imposing aspect of its citadel, the extent of its walls, and the height of its towers, which, being mostly of stone, give it an air of peculiar magnificence. But the illusion vanishes the moment the traveller enters the town, which presents an appearance of ruin, dirtiness, and neglect, in all its long and narrow valleys. According to Sir R. K. Porter, Kars is the Charsa of Ptolemy; and being considered as one of the strongest places in this part of the Turkish dominions, is the selected residence of the pasha of the northern frontier. In consequence of its situation as the very key of Armenia towards the north, it has stood a variety of sieges, and endured every change from the varied events of war. The population amounts to about 10,000 families, consisting of Turks, Koords, Armenians, Georgians, Jews, and a few Persian merchants. The place has no great appearance of prosperity. It is thirty miles from Erivan.

KARTAN, or MARTAN, four small islands in the Indian Ocean, near the southern coast of Arabia, at the entrance of the Gulf of Curia Muria. Long. 54. 50. E. Lat. 17. 30. N.

KARTUEL, or KARTALINIA, one of the four provinces which constitute the state of Georgia, and the most western of the whole, bordering on Immeritia. It occupies both banks of the Kur, and comprehends the greater part of the ancient Iberia; but it no longer boasts of the fine cities and handsome public buildings which it contained in the time of Strabo. The repeated revolutions which it has experienced since that period, and, in particular, the destructive inroads of the Lesghaes, have completely changed the face of the country, and almost exterminated its population. The few inhabitants who remain are to be found, as in ancient times, in the southern and middle mountains of Eastern Caucasus. They live chiefly by agriculture, and have their houses almost on the very tops of the hills.

KARUKU, a small island in the Eastern Seas, about three miles to the eastward of Amboyna. This island contains hot springs that will boil an egg. It is principally allotted to the culture of the clove tree.

KASAN, one of the eastern provinces of the Russian empire, which extends beyond the boundaries assigned to Europe by many geographical authorities. It has obtained the name of a kingdom. It was formerly inhabited by a people of the Finnish race, a branch of which, called the Viarmiers, in the most prosperous time of the western Roman empire, had founded a great commercial city at Perm, which flourished till about the year 1236, when this country was conquered by Ghengis Khan. His successors were driven out by some southern Tartars, who, constantly carrying on hostile operations with the Russians, under four different khans, denominated by the names of their respective capitals, Kasan, Astrakan, Kaptschak, and Krim. Unfavourable events induced the khans of Kasan and of Astrakan to make submission, at the end of the fifteenth century, to the Czar Iwan Basilijw I.; and the Russians from that period obtained great influence in the choice of khans over the other two districts. Peace was constantly interrupted between the Tartars and the Russians; and at length the Czar Iwan Basilijw II. conquered, in 1552, the city of Kasan, and in 1554 the city of Astrakan, and the other two were taken possession of by the Russians. The semblance of the Tartar rule was preserved under khans nominated by the czars till 1714, when Peter the Great erected his own government in the city of Kasan, and subjected to it the waywodeships of Simbirsk, Wiatka, Perm, and Pensa. These now form what is called the kingdom of Kasan; but each of the six has its separate government under a stadtholder. The whole extent is given, by authority, at 251,140 square miles, and the population as 5,867,000 persons.

KASAN, a stadtholdership or government of the Russian kingdom of the same name. It extends in north latitude from 54. 13. to 56. 44. and in east longitude from 47. 12. to 51. 39. It is bounded on the north by Wiatka, on the east by Orenburg, on the south by Simbirsk, and on the west by Nishegorod, and is divided into twelve circles or local governments. The whole extent is 22,960 square miles.

The face of the country is undulatory, not hilly, except that, in the south-east, some of the projections of the Ural Mountains enter the province; and on the right bank of the Wolga there are some calcareous hills, more remarkable for the extensive and lofty natural caverns in them than for their height. Being watered by two great rivers and a vast number of brooks and rivulets, and interspersed with woods, meadows, and corn-fields, it has a cheerful aspect, in spite of some districts which are covered with sand or wild heaths. The river Wolga, which runs through the whole province, receives the other streams, and conveys their water to the Black Sea. It is navigable throughout its whole extent, and abounds with fish, particularly with sturgeon, which produce much isinglass and caviare, and form an important part of food for home consumption, as well as for exportation to other districts, though chiefly to Moscow.

The number of inhabitants is 1,293,250, the greater portion of whom are of the Russian race; but there are still many of the Tartar family, and, what appears singular, they are represented as being better instructed than the Russian peasantry. They live in villages by themselves, and have been provided by the government with schoolmasters and books. They mostly practise agriculture, but some engage in handicraft employments, and they are generally peaceable and industrious. The Russians all adhere to the orthodox Greek church, and many of the Tartars have been converted to the same faith; but others of the latter yet retain their profession of Mahommedanism. There are still some remains of the Finnish race, who are a wretched set of people, without information, and generally indolent. There are but few nobles. There are 9200 small proprietors of land, and near 300,000 slaves, the property of the crown.

The husbandry is conducted upon the same plan as in most parts of the Continent, the rotation being a fallow succeeded by rye or wheat in the second year, and these crops by oats or barley in the third year, when the same course is repeated. The corn scarcely yields five times the quantity sown; but enough is raised for bread, as well as for distillation, and some is exported. A large quantity of hemp is grown, and some flax. The woods produce much excellent timber. They mostly belong to the crown, but some of them to private proprietors. There are manufactures both of linen and woollen goods, mostly of a coarse kind, but suited to the climate and the condition of the people. The meadows raise numerous herds of cattle, where hides and tallow are the most valuable of the exports. There are mines yielding copper, and others iron, and from the latter much steel is made. A large quantity of potash is made, and forms a material article of export. The river Wolga is the chief means of transport, and a certain source of commercial occupation and wealth.

KASCHIN, a city of the province of Twer, in Russia, the capital of a circle of the same name, extending over eighty-seven square miles, containing one city and 486 villages, with 75,896 inhabitants. The city is situated on the river Kaschinta, and contains twenty-five churches, 705 houses, and 3813 inhabitants. Long. 37. 35. E. Lat. 57. 20. N.

KASIMOW, a city of the Russian province Riasan, the capital of a circle of the same name, at the junction of the river Babinka with the Oka. It is surrounded with walls, which have been recently converted into pleasant promenades. It has a suburb inhabited by a tribe of Tartars, amounting to 500 persons, having been once the capital of a prince of that people. It contains ten churches, 1800 houses mostly of wood, and 9840 inhabitants. It has considerable trade, chiefly with the Tartars, in furs, and some manufactures of cloth and of earthen ware. Long. 41. 4. E. Lat. 55. 11. N.

KASMARK, a city of the circle of Zips, in the province of the Hither Theiss, in the kingdom of Hungary, and situated on the river Poprad. It contains 493 houses, and 4322 inhabitants, of whom 2619 are Lutherans, the remainder Catholics. It has considerable manufactures of linens, cloths, flannels, and blankets, and good salmon fishing on the river Poprad, which is navigable. Long. 20. 22. 5. E. Lat. 49. 7. 33. N.

KASSON. See KAARTA.

KATCHINS, a barbarous tribe of Asia, on the banks of the Yenisei, in the government of Tomsk, under the jurisdiction of Russia, and who pay tribute to that power. They are altogether pastoral in their habits, dwelling in tents, wandering from place to place, subsisting upon the produce of their herds. About six thousand of their number pay the capitation tax.

KATERLY, a town of Asia Minor, situated on a fine bay of the Sea of Marmora. It is the ancient Drepanum, and is in general a flourishing and populous place, though, at the time of Mr Kinneir's visit, it was almost deserted, in consequence of the plague.

KATTEGATTE, or CATTEGAT, a narrow sea, lying between part of Jutland and the coast of Sweden, and, towards the latter, covered with a great number of islands. It is almost closed at the extremity by the low Danish islands of Zealand and Funen, which, in ancient times, formed the seat of the Suiones. Between the former and the coast of Sweden is the Sound. These islands were anciently called *Codonania*, and gave to the Cattegat the name of *Sinus Codonanus*. Its greatest depth is thirty-five fathoms; but this decreases as it approaches the Sound, which begins with sixteen fathoms, and near Copenhagen shallows even to four. According to Pliny, the Roman fleet, under the command of Germanicus, sailed round Germany, doubled the *Cimbricum Promontorium*, and arrived at the islands which fill the bottom of the Cattegat, and of which, either by observation or information, the Romans were acquainted with twenty-three. One of these they called *Glessaria*, from its amber, a fossil abundant to this day on part of the southern side of the Baltic. A Roman knight was employed by Nero's master of the gladiators to collect in these parts that precious production, and thereby became perfectly acquainted with this country.

KATWYK, a town of the Netherlands, in the province of South Holland. It is distinguished from another place of the same name near it as Katwyk-on-the-Sea. It is celebrated for its sluices, deemed a masterpiece of hydraulic architecture, by which the old Rhine is admitted to the sea. It contains 2750 inhabitants.

KAUFBEUERN, a city of Bavaria, in the province of the Upper Danube, and situated on the river Bertoch. It is surrounded with walls, and contains one Lutheran and two Catholic churches, with 490 houses, and 4630 inhabitants. It has a brisk trade in cotton goods, linens, ironmongery, and paper, and Morocco leather and printed calicoes are also made. Long. 10. 31. 25. E. Lat. 47. 53. 10. N.

KAUKEHMEN, a town of the circle of Niederung, in East Prussia, situated on a canal connecting together the rivers Russ and Gilge. It is in the centre of a parish, which contains 4880 inhabitants.

KAURZIM, a circle of the Austrian kingdom of Bohemia, extending over 952 square miles, comprehending forty-one cities and towns, and 680 villages and hamlets, with 24,197 houses, and 150,609 inhabitants. The capital, a city of the same name, is fortified, and contains 282 houses, with 1520 inhabitants.

KAWSCHANI, a town of the Russian province Bessarabia, the capital of a circle of the same name. It was once the residence of the prince of the Nogai Tartars, and is said then to have contained 20,000 inhabitants, who are now diminished to little more than 2200, chiefly Jews and Moldavians, who live by gardening. Long. 29. 43. E. Lat. 46. 23. N.

KAWUCK, a town of Afghanistan, in the district of Cabul, situated in the Hindu Coosh range of mountains. Long. 69. 30. E. Lat. 35. 40. N.

KAYE'S ISLAND, in the North Pacific Ocean, near the west coast of North America, about thirty miles in length and four in breadth, so named by Captain Cook. The south-western point of the island is situated in long. 216. 58. E. and lat. 59. 49. N.

KAYNS, KIAYNS, or CARIANERS, a singular tribe who inhabit that mountainous and woody tract which lies between Bengal, Aracan, Ava proper, and the province of Munipoor or Cassay. They are represented as a simple, innocent race, speaking a language distinct from that of the Burmans, and entertaining rude notions of religion. Their habits are altogether pastoral, and they are the most industrious subjects of the state. Their villages form a select community, from which they exclude all other sects, and in no case reside in any city, or marry or intermingle with strangers. They profess and practise the doctrine of universal peace, never engaging in war, nor taking any part in contests for dominion. They devote themselves to agriculture, the care of cattle, and the raising of poultry. Almost all the provisions used in the country are raised by this tribe, and they particularly excel in gardening. They have of late years been oppressed and heavily taxed by the great Burman landholders, and have in consequence withdrawn into the mountains of Aracan. They have no written laws, but are guided by immemorial custom, which stands in the place of law. Some learn to speak the Burman tongue, and a few can read and write it imperfectly. They are (says Symes, in his account of his embassy to Ava) timorous, honest, mild in their manners, and exceedingly hospitable to strangers.

KAYOR, or CAYOR, a kingdom of Western Africa, situated on the coast between the rivers Gambia and Senegal. As is the case with many other kingdoms of Africa, correct or recent information regarding Kayor is very limited. According to Golberry, its western limits are the last five leagues of the left bank of the Senegal, adjoining to the mouth of that river, and all the extent of coast comprised between the bar of the Senegal and Point Serene, situated in lat. 14. 44. N. It is bounded on the north by the territory of Wal or Brack, eastward by the dominions of the Bourb Yolof, and on the south by the petty states of Sin and Salum. Extending 150 miles from north to south, by an average breadth of 120 miles, it thus comprises a surface of about 6000 square miles, which is thinly peopled by not more than 180,000 inhabitants. The ground rises imperceptibly from the sea-coast eastward, but without high mountains. The soil is sandy, but fruitful, and bears a number of those immense trees called *baobab*. At the little island of Goree, on this coast, the French have established the capital of all their African settlements. Its advantages consist solely in its almost inaccessible situation on a rock, three sides of which are perpendicular, and the fourth very steep. The rock is fortified, and the town contains about 7000 inhabitants. It is a bustling place, being the entrepôt of all the trade with the opposite coast, and also a place of refreshment for French ships on their way to India. The capital of Kayor bears the same name, and is only a large village, situated about 120 miles from Goree. The sovereign of the country is called Damel, and the government is feudal. The inhabitants are Jalofs or Yolofs, which people are described as the handsomest negroes of Western Africa, being tall and plump, with finely turned limbs, short curling hair, and shining jet-black skin. They are a domestic people, little known beyond their own territories, and recognise amongst themselves the distinction of caste.

KAZAMEEN, a town of Asia, in the pashalik of Bagdad, on the western bank of the Tigris. It contains about 8000 inhabitants, Persians, who have been induced to settle here on account of its being the burying-place of two noted saints, to the memory of whom a noble mosque has been erected. The town is ornamented with two gilded cupolas, supported by the contributions of pilgrims. It has a tolerable bazar, fifteen coffee-houses, three humums, and a caravanserai; and opposite to the town is a tomb of another Mahommedan saint. Nine miles south-west of the town, and at some distance from the river, is the very extraordinary structure which has received the name of the tower of Babel from Europeans, Nimrood from the natives of Bagdad, and Agerkuf from the Arabians. It is 190 feet in height, 100 in diameter; and, from its appearance, Mr Kinneir judged it to be coeval with the remains of ancient Babylon, being built of the same materials, namely, square bricks dried in the sun, cemented with slime and layers of reeds. It is three miles north of Bagdad.

KAZEROON, a town of Persia, in the province of Farsistan. It is situated in a valley about thirty miles long by seven or eight broad, bounded on the north by a salt lake, and fertilized by a number of rivulets of excellent water, producing in consequence abundant crops of grain, which are often destroyed by flights of locusts, the frequent and unwelcome visitors of all the country properly called Persia. It formerly consisted of three distinct villages. It was almost entirely depopulated during the late civil wars. It is now, according to Fraser, a heap of ruins, and does not contain above 3000 or 4000 inhabitants. It is a considerable mart for horses, which are bred in the vicinity, and are highly esteemed on account of their Arab blood. It is celebrated for its wrestlers, and for a class of bird-catchers, who practise a curious mode of taking sparrows.

KEAN, Edmund, a distinguished tragedian, was born at London about the year 1787, but, from the obscurity of his birth and parentage, the exact date is uncertain. His parents appear to have been either actors, or in some manner connected with the theatre, to which young Kean was introduced at a very early age. After appearing in various juvenile parts on the metropolitan boards, particularly in pantomimes, he joined a strolling company in 1804, amongst whom he became actor of all work, and with whom he visited various towns of England, and also Waterford in Ireland. He gradually began to attract attention in his profession, both by his histrionic powers and by his agility of body; for it was very common for him to perform the part of harlequin in a pantomime after he had personated Richard the Third or Shylock. He quitted Ireland in 1810, and became a wanderer on his own account, visiting Dumfries, Carlisle, York, and other places, and by his recitations earning a very precarious livelihood. We pretermit that chequered part of his career which he passed as a provincial actor, and come to that period of it when, having attracted the attention of individuals capable of appreciating his remarkable powers, he was engaged to appear at Drury Lane. This took place early in the year 1814, and the character in which he made his *debût* was that of Shylock. This performance was hailed with great applause, and he repeated it with increasing success, and also added Richard the Third, Hamlet, Othello, and other characters, to the list of those which he personated. Objections were made to the peculiarity of his style of acting, for it formed a complete contrast to that of Kemble, being less dignified, graceful, and elaborately finished, though more impassioned, fiery, and striking in particular parts; but he was very generally recognised as the most brilliant and original tragedian that had appeared for many years. His subsequent career is chiefly marked by a succession of appearances which increased his reputation; and, after the retirement of Kemble from the stage, he was considered as indisputably the first tragedian of his day. By many he was at all times esteemed superior even to Kemble in all the higher walks of the art. He gradually widened his range of characters, but those in which he chiefly excelled were the fine creations of Shakspeare already mentioned. He visited Scotland and Ireland, and in 1818 went to France. A few years afterwards he paid a visit to the United States of America, where he was received with the utmost enthusiasm. After his return to England, a private affair in which he was involved induced him to relax in his professional exertions, and retire for a time to the Continent. On his re-appearance before the public he met with considerable opposition, and failed to reinstate himself in his old position, so that the offer of an engagement in America was gladly accepted by him. Two seasons elapsed ere he again exhibited before an English audience. By the exertion of his rare talents, he acquired vast sums of money; but his prodigality kept pace with his fortunes; and his irregular mode of life having induced a premature decay both of his physical and mental powers, hastened his death, which event took place at Richmond on the 15th of May 1833. As an actor, Kean possessed great pathos, vigour, sarcastic power, and the faculty of creating terror in the highest degree. His intensity in expressing all the passions was extraordinary, but he was often too abrupt, paused too long between his sentences, and occasionally exhibited the bright points of a character instead of the whole. But his Richard, his Shylock, his Sir Giles Overreach, and his Othello, were performances as matchless, and as much his own, as were those of his great rival in Coriolanus and Cato. His figure was diminutive but graceful. His eye possessed remarkable brilliancy and force of expression; and the tones of his voice were highly musical, and capable of the most tender and pathetic expression. His life was published in 2 vols. 8vo, London, 1835.

KEATE, George, was born in 1730, and educated at Kingston School, after which he went to Geneva, where he resided for some years, and became acquainted with Voltaire. When he had made the tour of Europe, he became a student in the Inner Temple, and was called to the bar, but did not meet with such encouragement as to induce him to persevere. In the year 1760 he published his Ancient and Modern Rome, a poem which was received with considerable approbation; and the following year he gave to the world a short Account of the Ancient History, present Government, and Laws, of the Republic of Geneva, 8vo, dedicated to Voltaire, who once intended to translate it into French, but afterwards abandoned his design.

In 1762 he produced an Epistle from Lady Jane Grey to Lord Guildford Dudley; and next year The Alps, a poem, believed to be the best he ever wrote, for truth of description, vigour of fancy, and beauty of versification. In 1764 appeared Netley Abbey; and, in 1765, the Temple Student, an Epistle to a Friend, in which he rallies his own deficiency in application to the study of the law, and his consequent want of success in that profession. In 1766 he published a poem to the memory of Mrs Cibber, of whose talents as an actress he entertained a very high opinion. He married, in 1769, Miss Hudson; and about the same period he published Ferney, an Epistle to Voltaire. Having praised with energy the beauties of that philosopher's poetical works, he introduces a panegyric on Shakspeare, whom Voltaire used every effort to depreciate, probably from a spirit of envy. This eulogium induced the mayor and burgesses of Stratford to present our author with a standish mounted with silver, made out of the famous mulberry tree which is said to have been planted by Shakspeare himself.

In 1775 appeared his Monument in Arcadia, a dramatic poem; and in 1779 he published his Sketches from Nature, taken and coloured in a Journey to Margate, justly allowed to be an elegant composition. In the year 1787 came out The Distressed Poet, a serio-comic poem, in three cantos, occasioned by a long and vexatious law-suit. His last work was perhaps the most creditable of the whole, both to his head and to his heart. Captain Wilson, of the Antelope packet, having suffered shipwreck on the Pelew Islands, was refused any further command, and reduced to distress; a circumstance which induced the humane Keate to publish an account of these islands, for the benefit of that gentleman, which, it is said, brought him about nine hundred guineas in the space of a year. This work is written with much elegance, although it is probable that the manners of the natives of Pelew, in as far as regards their alleged amiability, are somewhat highly coloured.

The life of Keate was spent without any vicissitudes of fortune; he was possessed of an ample estate, which he never attempted to increase, except by prudence in the management of it. He was a man of beneficence and hospitality, and enjoyed in a high degree the favour of his countrymen. He died in June 1797, leaving one daughter.

KEBBAN DAG, a lofty range of mountains in Persia, province of Kurdistan, bounding the plain of Erzerum to the south-east. These mountains abound with springs, and give rise to numerous rivers; and they form the dividing ridge between the streams that flow into the Black Sea and those which flow east into the Euphrates.

KEBLA, an appellation given by the Mahommedans to that part of the world where the temple of Mecca is situated, towards which they are obliged to turn themselves when they pray.

KECSKEMET, a large town of the circle of Pest, in the Austrian kingdom of Hungary. It is in the middle of an extensive heath, between the Danube and the Theiss, and contains one reformed and four Catholic churches, three colleges, a Franciscan convent, a military academy, 3000 houses, and 24,862 inhabitants, who carry on considerable trade in internal productions. Long. 19. 37. 6. E. Lat. 46. 54. 29. N.

KEDAR, in *Ancient Geography*, a district in the desert of the Saracens (so called from Kedar the son of Ishmael, according to Jerome, who in another place says that it was uninhabitable), to the north of Arabia Felix.

KEDARNATH, a celebrated place of Hindu pilgrimage, in Northern Hindustan, situated in the mountains of Serinagur. Those who perform this difficult pilgrimage have to travel over the most steep and inaccessible roads, which, during half the year, are blocked up with snow. The place lies about fourteen or fifteen miles of direct distance west-north-west of Bhadrinath. The ceremonies observed here are nearly the same as at other places of Hindu ablution. The most peculiar of these is that of the widows shaving their heads, having previously bathed and purified themselves in the Ganges, which is here a narrow stream. Long. 79. 19. E. Lat. 32. N.

KEDES, in *Ancient Geography*, a city of refuge in the tribe of Naphtali, on the confines of Tyre and of Galilee. Jerome calls it a sacerdotal city, situated on a mountain, twenty miles from Tyre, near Paneas, and called *Cidissus*. It was taken by the king of Assyria.

KEDGE, a small anchor used to keep a ship steady whilst she rides in a harbour or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her slack cable, so as to loosen it from the ground. This is accordingly prevented by a kedge rope that hinders her from approaching it. The kedges are particularly useful in transporting a ship; that is, removing her from one part of the harbour to another, by means of ropes which are fastened to these anchors. They are generally furnished with an iron stock, which is easily displaced for the convenience of stowing them.

KEDGEREE, a town of Bengal, situated near the mouth of the Hooghly, where ships frequently stop either in entering or going out of the river. The river here expands to a breadth of nearly nine miles across. It is esteemed healthier than Diamond Harbour.

KEDRON, or CEDRON, in *Ancient Geography*, a town which, from the defeat and pursuit of the Syrians (1 Mac. xvi.), appears to have stood on the road leading from Upper India to Azotus. In this war it was burnt by the Jews.

KEDRON, or *Cedron*, in *Ancient Geography*. St John calls it a brook, but Josephus a deep valley between Jerusalem and Mount Olivet to the east. It was called *Kedron* from its blackness.

KEEL, the principal piece of timber in a ship, which is usually first laid on the blocks in building.

KEEL is also a name given to a low, flat-bottomed vessel, used in the river Tyne, to bring the coals down from Newcastle and the adjacent parts, in order to load the colliers for transportation.

Keel-Hauling was a punishment inflicted for various offences in the Dutch navy. It was performed by plunging the delinquent repeatedly under the ship's bottom on one side, and hoisting him up on the other, after having passed under the keel.

KEELAN ISLE, a small island, about twenty miles in circumference, lying off the western extremity of Ceram. The island is inhabited, and well planted with cocoa-nut and plantain trees. Long. 127. 55. E. Lat. 3. 15. S.

KEELSON, a piece of timber which may be properly defined the interior or counterpart of the keel, as it is laid upon the middle of the floor timbers, immediately over the keel, and, like it, composed of several pieces scarfed together.

KEEMA-KEDAN, a cluster of small islands, in the Eastern Seas, near the western coast of the island of Leyta. Long. 124. 36. E. Lat. 10. 30. N.

KEEN, or KAYNDUEM RIVER. This great river, which is supposed to have its source in the mountains which divide Assam from Ava, is the second river in the Burman empire. It enters Ava from the north-west, and falls into the Irrawaddy at Miondap, in lat. 21. 45. N. It is liable to floods during the rainy season; and, except during this season, its mouth is much obstructed by sand-banks covered with long grass and reeds. Being shallow, it is only navigable for flat-bottomed boats. Its banks are occupied by the rude and inoffensive tribes of the Kayns or Carianers. The adjacent country is said to be mountainous, and covered with wood. It has never been explored by Europeans.

KEEPER OF THE GREAT SEAL, is a lord by his office, and styled Lord Keeper of the Great Seal of Great Britain. He is always one of the privy council. All grants, charters, and commissions of the king under the great seal pass through the hands of the lord keeper.

Keeper of the Privy Seal is also a lord by his office, and through his hands all grants, pardons, and the like, pass before they come to the great seal; and even some things go through his hands which do not pass the great seal at all. This officer is also one of the privy council, yet was anciently called clerk of the privy seal.

KEEPING, in *Painting*, denotes the representation of objects in the same manner as they appear to the eye at different distances from it, for which the painter should have recourse to the rules of perspective.

KEFFING, an island, about forty-five miles in circumference, in the Eastern Seas, to the south-east of the island of Ceram, from which it is separated by a narrow strait. Long. 130. E. Lat. 3. 50. S.

KEFIL, a village of Irak Arabi, held in peculiar veneration both by Jews and Mahommedans as the tomb of the prophet Ezekiel, and hence a frequent resort of pilgrims. It is fourteen miles south of Hillah.

KEGWORTH, a parish in the county of Leicester, in the hundred of West Goscote, 114 miles from London. It stands on the river Trent, over which is Cavendish Bridge, built by the Duke of Devonshire, to whom a toll is paid. The inhabitants amounted in 1801 to 1360, in 1811 to 1550, in 1821 to 1607, and in 1831 to 1840.

KEHL, a town of the bailiwick of Kork, in the duchy of Baden. It is situated on the right bank of the Rhine, opposite to Strasburg, and during the revolutionary wars was celebrated for the strength of its fortress, which commanded the passage of the river, and stood on an island of the Rhine. The works have been neglected since 1815, and are now in ruins, though some of the more substantial buildings remain. There is a bridge connecting Kehl with Strasburg. The population has increased lately, and is said to exceed 2000.

KEIGHLEY, a market-town and parish in the west riding of the county of York. It is situated in a romantic spot in a valley, through which the river Aire runs, and near the canal which connects the two great trading towns of Leeds and Liverpool. It has thus an easy intercourse with every part of the kingdom, and a great increase of its trade and population has hence arisen. There are in it several large establishments for making woollen, linen, and cotton goods. The church is a large and handsome building, and it has several chapels for the different descriptions of dissenters. There is a well-supplied market on Wednesday. The population amounted in 1801 to 5745, in 1811 to 6864, in 1821 to 9223, and in 1831 to 11,176.

KEILL, John, a celebrated astronomer and mathematician, was born at Edinburgh in 1671, and studied in the university of that city. In 1694 he went to Oxford, where, being admitted of Baliol College, he began to read lectures according to the Newtonian system, in his private chamber in that college. He is said to have been the first who taught Sir Isaac Newton's principles by the experiments on which they are founded; and this, it seems, he did by an apparatus of instruments of his own providing, by which means he acquired a great reputation in the university. The first specimen he gave to the public of his skill in mathematical and philosophical knowledge, was his Examination of Burnet's Theory of the Earth, with remarks on Mr Whiston's Theory; and these theories being defended by their respective inventors, Mr Keill published an Examination of the Reflections on the Theory of the Earth, together with a Defence of the Remarks on Mr Whiston's New Theory. In 1701, he published his celebrated treatise, entitled *Introductio ad veram Physicam*, which only contains fourteen lectures; but in the following editions he added two more. This work has been translated into English, under the title of an Introduction to Natural Philosophy. Afterwards, being made fellow of the Royal Society, he published, in the Philosophical Transactions, a paper on the laws of attraction; and, being offended at a passage in the *Acta Eruditorum* of Leipsic, warmly vindicated against Leibnitz, Sir Isaac Newton's right to the honour of priority in the invention of the method of Fluxions. In 1709 he went to New England as treasurer of the Palatines. About the year 1711, several objections being urged against Sir Isaac Newton's philosophy, in support of Descartes's notions of a *plenum*, Mr Keill published a paper in the Philosophical Transactions, on the rarity of matter, and the tenuity of its composition. But whilst he was engaged in this dispute, Queen Anne appointed him her decipherer; and he continued in that situation under King George I. until the year 1716. He had also the degree of doctor of physic conferred upon him by the university of Oxford in 1713. Besides the works already mentioned, Dr Keill published *Introductio ad veram Astronomiam*, which was translated into English by the author himself; and an edition of Commandinus's Euclid, with additions of his own.

Keill, *James*, an eminent physician, and brother of the preceding, was born in Scotland about the year 1673; and having travelled abroad, read lectures on anatomy with great applause in the Universities of Oxford and Cambridge, by the latter of which he had the degree of doctor of physic conferred upon him. In 1700 he settled at Northampton, where he had considerable practice as a physician; and died there of a cancer in the mouth in 1719. He published, 1. An English translation of Lemery's Chemistry; 2. An account of Animal Secretion, the quantity of Blood in the human Body, and Muscular Motion; 3. A Treatise on Anatomy; and, 4. Several pieces in the Philosophical Transactions.

KEITH, James-Francis Edward, field-marshal in the Prussian service, was the younger son of William Keith, earl marischal of Scotland, and was born in 1696. He was designed by his friends for the law; but his inclination led him to the profession of arms, and the first occasion of drawing his sword was at the age of eighteen years, when the rebellion broke out in Scotland. Through the instigation of his mother he joined James's party, and was wounded at the battle of Sheriffmuir, but afterwards made his escape to France. There he applied himself to military studies; and having proceeded to Madrid, he, by the interest of the Duke of Leiria, obtained a commission in the Irish brigade, then commanded by the Duke of Ormond. He afterwards attended the Duke of Leiria when he went as ambassador to Muscovy; and, being by him recommended to the czarina, was promoted to the rank of lieutenant-general, and invested with the order of the black eagle. He distinguished himself by his valour and conduct in the Russian service, and had no inconsiderable share in the revolution which raised Elizabeth, the daughter of Peter the Great, to the throne. He also served in several embassies; but finding the honours of that country only a splendid species of slavery, he left the Muscovite court, and entered the Prussian service. The king of Prussia made him field-marshal of the Prussian armies, and governor of Berlin; and so far distinguished him by his confidence, as to travel in disguise with him over a great part of Germany, Poland, and Hungary. In business, Frederick made him his chief counsellor; in his diversions, his chief companion. The king was much pleased with an amusement which the marshal invented, in imitation of the game of chess. The latter ordered several thousand small statues of men in armour to be cast by a founder; these he would set opposite to each other, and range them in battle array, in the same manner as if he had been drawing up an army; he would then bring out a party from the wings or centre, and show the comparative advantage or disadvantage resulting from the different draughts which he made. In this manner the king and the marshal often amused themselves, and at the same time improved their military knowledge. This brave and experienced general, after rendering many important services in the wars of that illustrious monarch, was killed in the unfortunate affair of Hochkirchen, in the year 1758.

The family of Keith was amongst the most ancient in Europe. In 1010, the Scotch having gained a complete victory over the Danes at Camus Town in Angus, King Malcolm II., as a reward for the signal bravery of a certain young nobleman, who pursued and killed Camus, the Danish general, bestowed on him several lands, particularly the barony of Keith in East Lothian, from which his posterity assumed their surname. The king also appointed him hereditary great marischal of Scotland, which high office continued in his family till the year 1715, when the last earl having engaged in the rebellion, forfeited his estate and honours; and thus ended the family of Marischal, after serving their country in a distinguished capacity for above seven hundred years.

KEJ, a town of Persia, and the present capital of the province of Mekran. Being situated on the high road from Candahar, Kelat, Shikrapoor, Khozdar, Bayla, &c. to the sea-port towns of Guatter and Chobar, it is a town of considerable importance, and an emporium of trade. The town encircles a fort, which is built on a high precipice, under which a river runs; and, from its natural strength, it is considered as impregnable by the natives. The governor or naib of Kej holds the city and district under the nominal authority of Mahmood Khan of Kelat, though he does not acknowledge his authority by the payment of tribute. The revenues are trifling, and the governor, who formerly supported 4000 or 5000 men, has only a small number of Arabs in his pay. The country in the immediate vicinity is described as a flat and arid tract of waste land, extending northward as far as the sea-coast, and in some spots producing great quantities of dates. The flat is in some places intersected by ranges of hills and bare rocky mountains running north and south, but not advancing to the sea-shore.

KELAT, a city of Asia, the capital of Beloochistan, and thence called Kelat, or the city. Its situation is elevated on the western side of a well-cultivated plain or valley, about eight miles in length and two or three in breadth, the greater part of which is laid out in gardens and other enclosures. The town is built in the form of an oblong square; three sides of it are encompassed by a mud wall eighteen or twenty feet high, flanked at intervals of 250 paces by bastions, which, as well as the wall itself, are pierced with numberless loop-holes for matchlock men; but no cannon are now mounted. The defence of the fourth side of the city is formed by the western face of the hill on which it is built, being cut away perpendicularly. There are within the walls 2500 houses, without the wall 1250. They are built of half-burnt brick or wooden frames, and plastered over with mud or mortar; the streets are broader than those of native towns, and have mostly a raised pathway on either side for foot passengers, and an uncovered kennel in the centre, which is a recipient for all filth, and dirt, and stagnant water. The upper stories of the houses also stretching across the streets, render the part beneath them gloomy and damp. The palace of the chief of Kelat stands on the summit of the hill on which the city is built. Viewed from the outside, it appears an irregular heap of common mud buildings, with flat roofs, forming terraces, protected by low parapet walls pierced with loop-holes. The quarter on which the khan's residence is erected has been enclosed by a mud wall with bastions. The bazar of Kelat is extensive, and well furnished with every kind of goods, and with provisions of all sorts, which can be procured at a moderate rate. The town is also supplied with delicious water, from a spring in the face of a hill on the opposite side of the plain, whence it meanders through the centre of it. The inhabitants of Kelat may be divided into four classes, namely, the Beloches or Brahooes, Hindus, Afghans, and Dehwars. The latter are the principal merchants of the place, and are therefore encouraged by the chief. Long. 67. 57. E. Lat. 29. 6. N.

Kelat, or the fortress, is a singular valley in the province of Khorassan, in Persia, which extends, in a direction nearly east and west, from fifty to sixty miles in length, and from twelve to fifteen in breadth, situated amongst the hills that divide the plain of Mushed from the desert. It is surrounded by mountains so steep and difficult by nature as to be almost impassable, and they have been rendered completely so by art. The rocks, says Fraser, are scarped in the outside, presenting a mural appearance, so that there is no possibility of sealing them; and beyond these is a lesser range, with a hollow between, which the natives call the ditch. Not less care has been taken in the inside to increase every natural difficulty, so as to render a descent into or an escape from the valley equally impracticable. There are two openings in this valley, one at the western and one at the eastern extremity. These openings, which are both narrow and intricate, are called the *gates* of the fortress, and have been built up and fortified in such a manner that it is impossible to force an entrance. On these fortified gateways there are towers where watchmen are continually posted to give warning of all who approach, and none are admitted except those who have passed from the end of the valley. In this valley there is a great deal of cultivation, and its population amounts to 2000 families. It was in this stronghold that Nadir Shah intended to deposit his vast treasure. Futeh Allee Khan was placed in command of the fortress by Allee Shah, after the death of Nadir, and was killed in a brawl which subsequently took place. His son succeeded in putting the murderer to death, and he has ever since retained possession of the fortress. He is an independent chieftain, possessed of 1000 horse and 2000 foot, and can considerably increase the number by arming his villagers. As he is besides on good terms with the Toorkomans of the desert, he can always command a large force of their cavalry.

Kelat, a town and strong fortress of Afghanistan, in the province of Candahar. It was taken by the Emperor Baber in the year 1506; but, upon the decline of the Mogul empire, it fell again into the hands of the Afghans. Mr Foster, who passed it in 1783, describes it as a fort situated on an eminence, surrounded by a desert country. It is sixty miles east-north-east of the city of Candahar.

KELENDRI, a seaport of Caramania, in Asiatic Turkey, the ancient Celendris, the ruins of which lie scattered in heaps at the foot of the mountains, and along a small bay. It is twenty-five miles south-west of Selefkeh.

KELIKDONI, or Erminak, a river of Asia Minor, the ancient Calycadnus, which falls into the Mediterranean near Selefkeh. It is nowhere fordable, but travellers are accustomed to swim across on bladders.

KELLAMUNGULLUM, a town of Hindustan, in the ceded districts of Mysore, annexed to the Barramahal. It contains about 300 houses, and is defended by a small fort, with two reservoirs. A considerable quantity of opium is produced in the neighbourhood. It was at this place that, in 1799, the grand army assembled which overthrew the power of Tippoo Sultan. Long. 78. 5. E. Lat. 12. 35. N.

KELLY, Hugh, an author of some repute, was born on the banks of the lake of Killarney, in Ireland, in 1739. His father, a gentleman of good family, having reduced his fortune by a series of unforeseen reverses, was obliged to repair to Dublin that he might endeavour to support himself by his personal industry. A tolerable school education was all he could afford to give his son, who was bound apprentice to a stay-maker, and served the whole of his time with diligence and fidelity. At the expiration of his indentures he set out for London to procure a livelihood by his business, and there encountered all the difficulties a poor and friendless person might be expected to meet with on his first arrival in town. Happening, however, to become acquainted with an attorney, he was employed by him in copying and transcribing. He prosecuted this occupation with so much assiduity, that he is said to have earned about three guineas a week, an income which, compared to his former gains, might be deemed affluent. Tired, however, of this drudgery, he soon afterwards (about 1762) commenced author, and was intrusted with the management of the Lady's Museum, the Court Magazine, the

Public Ledger, the Royal Chronicle, Owen's Weekly Post, and some other periodical publications, in which he wrote many original essays and pieces of poetry, which extended his reputation, and procured the means of subsistence for himself, his wife, and a growing family. For several years after this period, he continued writing upon a variety of subjects, as the accidents of the times chanced to call for the assistance of his pen; and he employed himself in composing many pamphlets on the important questions then agitated, the greater part of which are now buried in oblivion. Amongst these productions, was a Vindication of Mr Pitt's Administration, which Lord Chesterfield makes honourable mention of in the second volume of his Letters. In 1767, the Babbler appeared in two pocket volumes, which had at first been inserted in Owen's Weekly Chronicle, in single papers; as did also the Memoirs of a Magdalene, under the title of Louisa Mildmay. About 1767, he was tempted, by the success of Churchill's Rosciad, to write some strictures on the performers of both theatres, in two pamphlets, entitled Thespis, which gave great offence to some of the principal persons at each house. The talents for satire which he displayed in this work recommended him to the notice of Mr Garrick, who, in the next year, caused his first play of False Delicacy to be acted at Drury Lane. It was received with great applause; and from this time he continued to write for the stage with profit and success, until the last period of his life. As his reputation increased, he began to turn his thoughts to some mode of supporting his family less precarious than by writing, and for that purpose entered himself a member of the Middle Temple. After the regular steps had been taken, he was called to the bar in 1774, and his proficiency in the study of the law afforded promising hopes that he might make a distinguished figure in that profession. But his sedentary course of life had by this time injured his health, and subjected him to much affliction. Early in 1777, an abscess formed in his side, which, after a few days' illness, put a period to his life. He was the author of six plays besides that above mentioned.

KELP, a term which is used in Britain to signify the alkaline substance obtained by burning sea-weed, and which is chiefly employed in the manufacture of green glass. Different species of sea-weed, belonging to the genus *fucus*, and order *algæ*, are cultivated for this purpose. These plants are thrown on the rocks and shores in great abundance, and in the summer months are raked together and dried as hay in the sun and wind, and afterwards burned to the ashes called *kelp*. The process of making it is this: The rocks which are dry at low water are the beds of great quantities of sea-weed, which is cut, carried to the beach, and dried. A hollow is dug in the ground three or four feet wide; round its margin are laid a row of stones, on which the sea-weed is placed and set on fire within; and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted metal drops into the hollow beneath. When it is full, as it commonly is ere the close of the day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an uniform consistence in the state of fusion. When cool, it consolidates into a heavy, dark-coloured, alkaline substance, which undergoes in the glass-house a second vitrification, and, when pure, assumes a perfect transparency.

KELPOORY, a town and small district of Hindustan, in the province of Delhi. The district is situated about the 29th degree of north latitude, and is bounded on the north by the mountains of Kemaon. The soil is fertile, with the exception of a considerable portion that is overgrown with extensive forests. It was ceded to the Company in 1801 by the nabob of Oude, and is now included in the collectorship of Bareilly. The town is forty-eight miles north-north-east from Bareilly. Long. 79. 39. E. Lat. 28. 59. N.

KELSO, a town of Roxburghshire, is delightfully situated, partly on a plain, and partly on a declivity on the north bank of the Tweed, opposite to its junction with the Teviot, in long. 1. 20. W. and in lat. 55. 38. N. When the town was first built cannot now be ascertained; but, from various ancient records, in which the name is written Calchow, Calco, and Kellsowe, it appears to have been of considerable antiquity and importance.

During the border conflicts, Kelso was frequently exposed to the ravages of war, and was thrice burned down by the English. It was also destroyed by an accidental fire in the year 1686, and at different subsequent periods of its history.

The Duke of Roxburghe, whose magnificent mansion is situated about a mile to the west, and commands one of the most delightful prospects, is superior of the town, and lord of the manor. Kelso was first incorporated into a burgh of barony in the year 1605, under a charter granted by King James I. to Sir Robert Ker of Cessford; and it is governed by a baron bailie and fifteen stentmasters, who compose the town council, eight of whom are nominated by the bailie, and seven by the different incorporated bodies.

The town, which has of late been greatly improved by the erection of many elegant houses, consists of four principal streets, branching at right angles from a spacious square or market-place, extending in length 300 feet, and in breadth 200. On the east side stands the town-hall, a chaste modern structure, two stories in height. But the most attractive object to the eye of the stranger is the ruins of the venerable abbey, which present one of the finest specimens of Saxon or early Norman architecture that this country can produce. It is built in the form of the Latin cross, with the principal entrance to the west, of which only a segment remains. Some years ago, the modern part of the building, which was used from the time of the reformation till 1773 as the parish church, was taken down, and the interior of the structure, disclosing two lofty pointed arches, exposed to view. The abbey was founded on the 3d of May 1128, by David I., by whom it was richly endowed; but it was destroyed during an incursion of the English in the year 1545, under the Earl of Hertford. Contiguous to the abbey is the bridge over the Tweed, founded in the year 1800. It is a handsome and elegant structure, consisting of five bold elliptical arches of nearly equal span.

Kelso being in the centre of a rich and fertile agricultural district, has, besides a weekly market on Fridays, two fairs in the year, as well as different other markets at fixed seasons for the sale of stock, horses, and the like. Notwithstanding many facilities for carrying on manufactures, Kelso is without any. There are, however, a distillery and a brewery, four public banks, and a gas-work; and it is in contemplation to carry into execution a rail-road from Berwick, by Kelso, to Hawick, for which an act of parliament was obtained some years ago. There are six places of worship in the parish, including an established church and an Episcoplian chapel. There are two parochial schools, one for Latin, and the other for reading, writing, &c., besides several private seminaries of education, a subscription school for the poor, and another for the instruction of girls, founded and principally supported by the Duchess of Roxburghe. Kelso possesses a public dispensary, three public subscription libraries, two reading rooms, a debating society, and another called the Tweedside Physical and Antiquarian Society. In 1821, the population amounted to 4000, and in 1831 to 4700.

KELVEDON, a town of the hundred of Whitham, in the county of Essex, on the great road to Colchester and Ipswich, forty miles from London. It stands on the river Pant, in a very fertile district, and consists chiefly of one long and well-built street, with several good inns. The population amounted in 1801 to 994, in 1811 to 1186, in 1821 to 1328, and in 1831 to 1463.

KEMAON, or KUMAON, a district of Northern Hindustan, which was formerly a Hindu principality, conterminous with that of Duti on the east, the boundary line being the Cali River. On the west it was separated from Gurwal by the Ramgunga, and extended a considerable way into the plains of Bareilly. The modern district of Kemaon, as it has been regulated by the British since its conquest in 1815, comprehends the whole tract of country between the Ganges and the Cali, from the plains to the highest pinnacle of the Himalaya, which space includes a large portion of the Gurwal province south-east of Alcananda, whilst the Cali River on the east forms a natural and well-defined boundary towards Nepaul. The other geographical divisions are Kemaon proper, Painkhandi, and Bhutant, within the limits of which last is the pass of Niti, supposed to have been the earliest and most frequented route into Chinese Tartary. It includes an area of 7000 square miles.

Kemaon is situated amongst the lower ranges of the Himalaya Mountains. It is separated from the lower districts of Bareilly and Morabad by a thick forest of nearly two days' journey, which surrounds the whole and skirts the margin of the mountains. The soil is marshy, and the atmosphere, during two thirds of the year, is more pestilential than that of the Sunderbunds; it is, says Heber,[1] " a literal belt of death, which even the natives tremble to go near, and which, during the rains more especially, the monkies are forced to abandon. After the middle of November this is dry, practicable, and safe." Kemaon proper is separated on the north-east from the province of Gurwal by a range of mountains, which, in point of ruggedness, presents a contrast to the hills of Kemaon. These latter appear to rise in a regular gentle acclivity from their bases; and the soil is fertile, consisting of rich earth, which gives nourishment to fine verdure and extensive forests. The hills are also intersected by rather spacious valleys, rendered fertile by tillage; and the cultivation is more extended, and carried farther up the hills, than in Gurwal with a denser population. In these valleys, rice is produced in abundance, and the cultivator is thus in a manner rendered independent of the seasons, as the numerous mountain streams, descending in every direction, enable him to irrigate all the lower lands. The higher lands produce wheat, barley, and various small grains, which being raised in a redundant quantity, form an article of traffic with Bhutant. There are several passes into Kemaon from the districts of Bareilly and Morabad, but those leading through Cossipoor and Roderpoor are considered as the best, and are most frequented. The first leads by Chilkeah, where an annual fair is held, to which the hill people resort in great numbers. Similar meetings also occur at Bhagesur, on the banks of the Cali, each continuing ten days, and are frequented by merchants from Bhote and the low countries. Chilkeah is one of the principal marts of trade in Kemaon, and through that country into Thibet and Tartary. The article which meets with the readiest sale is cloth with distinct colours on each side. European articles, of a coarse quality, are also in demand, such as knives, razors, wine-glasses, tumblers, spying and looking glasses, spectacles, and cheap enamelled watches; and Bishop Heber also saw exposed to sale English cloths, and eastern shawls of good appearance, with many other serviceable and valuable commodities. The greatest staple that is exported from this southern frontier has always been timber, found in the immense forests already mentioned, which skirt the border. Here the saul forests are of great extent, and produce some of the best timber of that species in India. Owing to the difficulty of access, it is necessary to convert the trees into planks on the spot, that they may be the more easily transported to the populous parts of the country. In some parts they have to be carried down a perpendicular height of 500 feet. The fir-tree grows to an immense size, and it is much stronger than the firs of Europe, and as heavy as teak, the grain strong and full of turpentine. Some of the trees have from sixty to seventy feet clear of branches, and the spans are from twenty to twenty-three inches in diameter. Rosin, turpentine, doedwar, oil, and hemp of an excellent quality, are to be found among the Kemaon Hills. The bamboo, though small, grows remarkably tough, and seems to gain consistency and soundness from a certain degree of frost. The same is said to be the case with the plantains. The tea-plant grows wild all through Kemaon, but cannot be made use of, from an emetic quality which it possesses. The upper mountains produce copper, lead, iron, and the Panar River gold, but there is no mine of consequence. The northern parts are cold, and yield pasture for numerous flocks of sheep; and in summer a considerable intercourse is carried on with the country subject to China.

The towns and villages of Kemaon, when viewed from a distance, present a neat appearance. But a nearer approach does not confirm these favourable prepossessions. They are generally surrounded by dirt and filth; though Bishop Heber mentions, that the town of Almorah is very neat, with a natural pavement of slaty rock, which is kept beautifully clean. He mentions, however, of the peasantry, namely, the Khasyas, that, near Almorah, though they are honest, peaceable, and cheerful, they are dirty to a degree which he never saw amongst the Hindus, and extremely averse to any improvement, using their women ill, and employing them in the most laborious tasks. These people are rigid Hindus. The houses are generally constructed of large masses of stone, roofed with slate, and of two stories in height, the lower story being allotted to cattle. Their poverty is extreme, their food consisting of coarse cakes made from the grain of a kind of holcus, in which the flour, bran, and husk, are mixed together, and baked, or rather scorched, on the fire. In other parts, however, as he advanced farther among the hills, Bishop Heber saw tolerably neat and comfortable cottages, the people better fed and clothed than most of the Khasyas. Polygamy is common among the lower classes.

Wild animals abound in the mountains and forests of this country. The tiger is found quite up to the glaciers, of size and ferocity undiminished. There are also lynxes, and bears are common and mischievous throughout the province. Though they do not, except when pressed by hunger, eat flesh, preferring roots, berries, and honey, yet, as if out of capricious cruelty, they often worry and destroy passengers. The chamois is not uncommon in the snowy mountains, but scarce elsewhere; and the hares are much finer and larger than those in Hindustan, and not much inferior to those of Europe. The musk-deer is also found in the highest and coldest parts of the province, and the neighbouring countries of Thibet and Tartary. It cannot, says Heber, even bear the heat at Almorah. In like manner, the yak or mountain ox of Tartary droops as soon as it leaves the neighbourhood of the ice. The shawl-goat will live, but its wool degenerates. On the other hand,

[1] Vol. ii. p. 143.

Kemaon.

English dogs, impaired by the climate of the plains, improve in strength, size, and sagacity, amongst the mountains; and it is remarkable that, in a winter or two, they acquire the same fine short shawl-wool, mixed with their own hair, which distinguishes the indigenous animal of the country. The same is in some degree the case with horses. Flying squirrels are also common amongst the colder and higher parts of these woods. Some of the marmots, of the alpine kind, also abound in the neighbourhood of the snow. A singular species of wild dog is mentioned as a native of these hills. In form and fur these animals resemble a fox, but they are much larger. They hunt in packs, give tongue like dogs, and possess a very fine scent. They make great havock of the game amongst the hills, and even attack and destroy the tiger, overpowering him by their numbers. Of birds, the condor is to be found of a remarkable strength and size. Eagles are numerous, and very large and formidable; and these birds do much injury to the shepherds and goatherds, and sometimes carry away the poor naked children of the peasants. Their nests being in the remote glaciers, and among inaccessible crags, there is no possibility of destroying these dangerous animals. There are larks in Kemaon, not very different from the English, as well as quails, partridges, pheasants, thrushes, &c. A little bird resembling the robin, and the goldfinch, are found at the foot of the snowy mountains.[1]

This country, though, from its elevation, the climate is colder than in Hindustan, with ice and snow in winter, is remarkably unhealthy, from a certain malaria which prevails in all the lower valleys, especially during and after the rainy season, and which gives rise to ague, intermittents, and fevers which assume the appearance of typhus, and under which the powers of life decline more rapidly, though often not more surely, than under continued fits of the ague. Several of the inhabitants seen by Bishop Heber in this devoted region, he describes as singularly wretched; the fever and the ague destroying all their energy, and preventing them from adopting the simple means of dry and well-raised dwellings, and sufficient clothing, to support life and health. "They are," says the intelligent traveller already quoted, "a very ugly and miserable race of human beings, with large heads, and particularly prominent ears, flat noses, tumid bellies, slender limbs, and sallow complexions, and have scarcely any garments but a blanket of black wool, though most of them have matchlocks, swords, and shields." The chief region of insalubrity is at the foot of the lowest hills, where a long, black, and level line of forest extends, though the mountainous country is also more or less unhealthy in all the low valleys. This insalubrity is said to be increasing. The industry of the inhabitants was at one time reclaiming the forest, and the cowmen and woodmen were pushing their incursions farther every year; and the plains, now desolate, being shunned as the abodes of disease, were once populous. But the country was ruined by the invasion of Meer Khan in 1805, and it has never recovered from the devastation to which it was exposed from his licentious soldiery. So terrified are the natives to approach it, that no witnesses can be procured, at certain seasons of the year, to attend the circuit court; and two of them, rather than go to Chilkeah, forfeited a small pension which was due to them.

This country was acquired by the British government in 1815, when its limits were extended to the westward by the annexation of a portion of Gurwal, east of the Alcananda and the Ganges. Prior to this, it was ruled by military chiefs, who owned a nominal allegiance to Nepaul, though they were nearly independent within their own territories. They were extremely tyrannical, and not only divided the lands amongst themselves, without regard to the rights of the ancient proprietors, but, on any arrears of rent, sold the wives and children of the peasants as slaves, to an amount almost incredible, whilst they quelled every murmur among the people by the most barbarous severity. The court of Nepaul issued repeated edicts against the practice, but without effect, since most of the young persons who were of a marketable age were sold into slavery when the British, to the great joy of the inhabitants, who gave them every possible aid, acquired possession of the country. Since this period uninterrupted tranquillity has prevailed, which may be partly ascribed to the peaceable and orderly habits of the people, and to the general popularity of the British government. The revenue of the country has been fixed at 85,746 rupees for Kemaon proper, and at 37,614 for the annexed districts of Gurwal; and, as a proof that the assessment is moderate, it has been punctually realized, and has even been paid in many instances in advance.

Almorah is the chief town. The population of Kemaon proper is estimated at 300,000; that of Gurwal, east of Alcananda, is yet more considerable; and the people generally are in a high state of civilization. (F.)

Kemble.

KEMBLE, John Philip, one of the greatest tragedians that England ever produced, was born on the 1st of February 1757, at Prescot, in Lancashire. Mr Roger Kemble, his father, though only the manager of a provincial company of actors, was of ancient and respectable family; and, sensible of the disadvantages attending his own profession, sent his son to receive his education at a Roman Catholic seminary, for the purpose, it is believed, of qualifying him to take orders in the Catholic church. He was also a student for two or three years at the College of Douay; but the strength of natural bias prevailed, and he became an actor in 1776. After performing in York, Liverpool, Manchester, Edinburgh, Dublin, and other places, and gradually acquiring reputation, he made his first appearance before a London audience on the 30th of September 1783, in the character of Hamlet. He was received by the public generally with great applause, although, as always happens in such cases, a party lagged behind, preferring and paying greater homage to a favourite idol of longer standing. He rapidly attained an acknowledged pre-eminence in the tragic scene, and took that decided lead which he ever afterwards maintained. He subsequently undertook the management of Drury Lane Theatre, which he conducted, with only a slight interruption, till 1801; and during that period the drama was indebted to him for various and considerable improvements, particularly in introducing appropriate costume. In 1794, he brought out a musical piece of his own, entitled *Lodoiska*, which was very successful at the time, and is still occasionally performed. He likewise revived old pieces of merit, and brought forward many new productions, some of which were of considerable merit, altered by himself. In 1802, he visited the Continent; and on his return to London, purchased a sixth share of Covent Garden Theatre, and became manager of that establishment. His career in this place was brilliantly successful, but partially suspended in consequence of the total destruction of the theatre by fire in 1809. A new edifice, however, was speedily reared, and opened with an increase of entrance-money, which, along with certain arrangements regarding the private boxes, created a series of disturbances, known by the name of O. P. riots, which lasted for sixty-six nights, and in which the public finally

[1] Heber, *Narrative of a Journey through the Upper Provinces of India*, vol. ii. p. 218, 219.

Kemble. carried their point. Kemble stood the storm with firmness; but he was subjected to much insolence, without having the power of retaliation within his reach. In 1812 he retired for two years, conceiving he had done his part, and being desirous of repose. His return to the stage was hailed with the utmost enthusiasm. He rose to the summit of popularity, and was acknowledged, without dispute, as the first actor in Britain, probably in the world. His health, however, began to give way; and he formed the resolution of taking farewell of the stage, which he did on the 23d of July 1817, after performing, with unabated power, his great character of Coriolanus. The "Valedictory Stanzas" addressed to him at a public meeting held in that month, do equal honour to the actor, and the poet Mr Campbell; and Sir Walter Scott composed the "Farewell Address" which he delivered on taking leave of the Edinburgh stage in the month of March preceding. He retired to the Continent, and fixed his residence at Lausanne, where he died on the 26th of February 1823.

In judging of the talents of Mr Kemble, we must regard him in the threefold character of actor, manager, and improver of dramatic representation. In reference to the first, tragedy, and that of the most stately and majestic character, was the line in which he excelled. His person was on a scale suited to the stage, being tall and stately; his countenance, in nobleness of expression, resembled the finest models of the antique; and his movements and demeanour, at once majestic and graceful, corresponded to the heroic cast of his form and features. What others assumed, seemed in him to be inherent. He looked an abstraction of the characteristics of tragedy, and trode the stage with solemn and majestic step, as if he were there "native, and to the manner born." His style was his own, and seemed to grow out of the peculiar qualities of his person and his intellect. It was that in which taste and judgment qualify and soften spontaneous conception and feeling with profound consideration, measured dignity, and learned precision. Talking of him generally, his deportment was solemn, his movements slow, his utterance deliberate, and always finely articulated, and his bearing and expression of countenance contemplative. His voice was distinct and impressive; but an early tendency to asthma rendered it necessary for him to husband his efforts in the more level parts, reserving them for those bursts of passion to which he gave such sublime effect. His acting was the result of long and laborious study, assisted by learning; he was a profound master in his art, and metaphysically curious in expressing each line of his part with the accent and manner exactly appropriate. Every word of a sentence had its peculiar emphasis; and this attention to minute details led him sometimes to suspend the action so long as to injure the effect, which, to be perfectly grand, should be instant, and not anticipated by any "note of preparation." A sacrifice of energy of action to grace has likewise been reckoned amongst the faults ascribed to this great actor; but this was more than compensated by the correctness of his conception of character, the precision of his taste, the patience of his investigation, which allowed of no point passing unconsidered, and that moral firmness which enabled him to maintain his own views regarding readings, when he believed himself in the right, against all opposition. Although some detracted from his merits on account of his peculiarities, all concurred in regarding him as a highly-gifted actor; and the impression which he made in characters more immediately adapted to his style of excellence, such as Cato, Coriolanus, Penruddock, Brutus, Macbeth, Hamlet, John, Jaques, and many others, will last as long as any mere recollection connected with the drama can last. As a manager he was gentlemanly, accurate, and regular; but somewhat strict. Reformation was carried by him into almost every department of the drama, and his innovations were calculated to confer permanent benefit on the art. Before his time there was no such thing as regular costume, and anachronisms of dress of the most ludicrous description were constantly exhibited. These Kemble reformed, by diligently consulting illuminated manuscripts, ancient pictures, and other contemporary authorities. Scenic decoration he also carried to a high degree of perfection, thereby adding to the splendour and illusion of the drama. In early life he published a volume of *Fugitive Pieces;* but all the copies of this production he afterwards carefully destroyed. His life (in 2 vols. 8vo, 1825) has been written by Mr James Boaden, a person whose power of doing justice to the subject of his biography appears to be extremely disproportionate to the admiration with which the great founder of the classic school of acting had inspired him. (R. R. R.)

Kempe ‖ Ken.

KEMPEN, a town of Prussia, the capital of the circle of the same name, in the province of Cleeves-Juliers. It contains 520 houses, with 3120 inhabitants, who carry on manufactures of linen and tapes. It is also the birth-place of the celebrated divine, Thomas à Kempis.

KEMPIS, Thomas a, a pious and learned regular canon, was born at the village of Kemp, or Kempen, in the diocese of Cologne, in 1380, and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made great progress in the sciences. In 1399 he entered the monastery of the regular canons of Mount St Agnes, near Swol, of which his brother was prior. Thomas à Kempis there distinguished himself by his eminent piety, his respect for his superiors, his charity to his brother canons, and his continual application to labour and prayer. He died in the year 1471, at the age of ninety. The best editions of his works, which consist of sermons, spiritual treatises, and lives of holy men, are those of Paris in 1649, and of Antwerp in 1607. The well-known book *De Imitatione Christi*, which has been translated into all the languages of the civilized world, though it has commonly been numbered amongst the works of Thomas à Kempis, is also found printed under the name of Gerson; and, on the credit of some manuscripts, it has been since ascribed to the abbot Gerson, of the order of St Benedict. This occasioned a violent dispute between the canons of St Augustin and the Benedictines.

KEMPTEN, a city of Bavaria, in the province of the Upper Danube. It is situated on the river Iller, which is navigable nearly to its site, and is surrounded by hills. It is the seats of the revenue and police boards of the circle, and of the local courts of justice, both for civil and criminal affairs. The trade is inconsiderable, but consists in small linen and woollen manufactures. It contains 850 houses, and 5640 inhabitants, chiefly Catholics. Long. 10. 13. 25. E. Lat. 47. 44. 10. N.

KEN, Thomas, a deprived bishop of Bath and Wells, descended from an ancient family established at Kenplace, Somersetshire, was born at Berkhamstead, Hertfordshire, in the month of July 1637. At the age of thirteen he was sent to Winchester School, where he remained some time, and thence removed to New College, Oxford, of which he became a probationer-fellow in 1657. He took his degrees regularly; pursued his studies closely for many years; and in 1666 became a fellow of Winchester College, soon after which he was appointed domestic chaplain to the Bishop, and obtained the rectory o. Brixton in the Isle of Wight. In 1674, he made a journey to Rome, and after his return took his degrees in divinity. Not long afterwards, having been appointed chaplain to the Princess of Orange, he went to Holland, where his piety and prudence gained him general esteem; but having offended the prince, afterwards William III., by obliging one of his favourites to espouse a young lady of the princess's train whom he had seduced by a promise of marriage, Ken returned to England, and was employed to attend Lord Dartmouth in quality of chaplain to Tangier. Having returned with this nobleman in 1684, he was immediately appointed chaplain to the king, and not long afterwards nominated, without solicitation, to the bishopric of Bath and Wells. He attended the king in his last illness, and did his utmost to awaken the royal conscience; speaking, says Burnet, "with great elevation of thought and expression, and like a man inspired." The sudden death of the king delayed his admission to the temporalities of the see of Wells; but, on the accession of King James, new instruments were prepared for that purpose, and Ken entered upon the exercise of his episcopal functions. In 1685, he published an exposition of the Church Catechism; and, the same year, he gave to the world Prayers for the use of the Bath. He took no part in the popish controversy which was then so warmly agitated, though, in his discourses from the pulpit, he frequently took occasion to notice and confute the errors of Popery; nor did he hesitate, when preaching in the chapel-royal, to set before the court the dangerous policy of its projected coalition with the sectaries. Some attempts were made to gain him over to the interest of the popish party; but these proved completely abortive; and when the declaration of indulgence was ordained to be read, in virtue of the dispensing power assumed by the king, Ken was one of the seven who openly opposed it, and who were in consequence sent to the Tower. But though he ventured to disobey the mandate of his sovereign for the sake of his religion, he refused to transfer his allegiance; and, accordingly, on the arrival of the Prince of Orange, he suffered himself to be deprived, and withdrew to Longleate, a seat of Lord Weymouth, in Wiltshire, where he composed many pious works, and amused himself with writing verses, which, however, have but little of the spirit of poetry in them. Eventually he had settled on him a pension of L.200 a year, which was punctually paid out of the treasury as long as he lived. Dr Ken, who had long been afflicted with colic pains, experienced, in 1710, a paralytic attack, which deprived him of the use of one side; and, after lingering for some time in a hopeless state, he expired at Longleate, upon the 19th March 1711. His works, consisting for the most part of devotional pieces, in verse as well as in prose, were published in 1721, in four volumes. (A.)

Ken, a small island in the Persian Gulf. It possessed at one time a flourishing commerce, and is still capable of supplying refreshments to vessels, being better planted than most of the islands. Its ancient name was Kataia. It has a low and rocky coast in some parts, and must be approached with caution in the night. Long. 53. 40. E. Lat. 26. 27. N.

KENANY, a small island of Hindustan, situated about thirteen miles south of Bombay, and two and a half from the mainland. In 1678 Sevajee, the Mahratta chief, took possession of it, and from this station he greatly annoyed the trade of Bombay. It has a small harbour for vessels drawing little water, on the eastern side. Long. 72. 56. E. Lat. 18. 42. N.

KENDAL, a market-town of the county of Westmoreland, in the ward of the same name, 260 miles from London. It is situated on the river Ken, in a pleasant valley, and, by inland navigation, comes into connection with the sea, and with the rivers Morrey, Dee, Ribble, Ouse, Trent, Severn, Humber, Thames, and Avon. There is much industry applied to manufactures, the principal of which are the inferior kinds of woollen cloths and stuffs. It is a corporate town, under a mayor, twelve aldermen, and twenty-four capital burgesses, but returns no members to parliament. There are guilds or companies for several branches of trade, which now scarcely exist. The church is a large Gothic building, and there are chapels for the various denominations of Protestant dissenters, and for Roman Catholics. It is one of those towns which have been much increased and improved of late years. The population amounted in 1801 to 6892, in 1811 to 7505, in 1821 to 8984, and in 1831 to 10,015.

KENILWORTH, a town of the county of Warwick, in the hundred of Knightlow, 100 miles from London. It is celebrated as the residence of the Earl of Leicester, the favourite of Elizabeth, and for the entertainments given in the castle, the ruins of which attest their former splendour. There is a market which is held on Wednesday. The inhabitants amounted in 1801 to 1968, in 1811 to 2279, in 1821 to 2577, and in 1831 to 3097.

KENNEL, a term used indifferently for a puddle, a water-course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves. See Hound and Hunting.

KENNERI, a collection of remarkable caverns excavated in the rocky hills of the island of Salsette, near to Bombay, one of which had been fitted up by the Portuguese as a church, and they consequently thought it their duty to deface all the most pagan-looking sculptures. The fine teak ribs for supporting the roof are almost gone, and the portico is not so elegant as that at Carli. On the sides are two gigantic erect figures, each twenty-five feet in height, with their hands close to their bodies, which resembled the figures of Buddha seen at Ceylon. On each side of the great cave are smaller ones, apparently unfinished. The origin of these singular excavations is lost in obscurity. There is not even the slightest gleam of tradition to guide the antiquarian in his researches into these curious memorials of Hindu or Buddha superstition; and in what age of the world, or by what people, they have been completed, is a question now likely to remain for ever unknown.

KENNET, White, a learned English writer, and Bishop of Peterborough in the eighteenth century, bred at St Edmund Hall, Oxford, where he soon distinguished himself by his vigorous application to his studies, and by his translations of several works into English, and other pieces which he published. In 1695 Kennet published his Parochial Antiquities. But a sermon preached by him on the 30th of January 1703, at Aldgate, exposed him to great clamour. It was printed under the title of *A compassionate Inquiry into the Causes of the Civil War.* In 1706 he published his Case of Impropriations, and two other tracts upon the same subject. In 1706 he brought forward the third volume of the Complete History o. England, the two former volumes having been compiled by Mr Hughes. In 1709, he published a Vindication o. the Church and Clergy of England from some reproaches rudely and unjustly cast upon them; and a true Answer to Dr Sacheverel's Sermon. When the great point in Dr Sacheverel's trial, namely, the change of the ministry, was gained, and strange proceedings took place upon it, an artful address by the bishop and clergy of London was to be prepared, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr Kennet fell under this imputation. He was exposed to great odium as a low churchman, on account of his conduct and writings. When he was Dean of Peterborough, an uncommon method was taken to expose him by Dr Walton, rector of the church of Whitechapel. In the altar-piece of that church, which was intended to represent Christ and his twelve apostles eating the passover and last supper, Judas the traitor was drawn sitting in an elbow chair, dressed in a black garment, with a great deal of the air and appearance of Dr Kennet. It was generally said that the original sketch was intended for a bishop under Dr Walton's displeasure; but the painter being apprehensive of an action of *scandalum magnatum*, leave was given to drop the bishop and paint the dean. As this gave general offence, however, the Bishop of London ordered the picture to be taken down. In 1713 he presented the Society for Propagating the Gospel with a great number of books suitable to their design; published his *Bibliothecæ Americanæ Primordia;* and founded an antiquarian and historical library at Peterborough. In 1715 he published a sermon entitled the Witchcraft of the present Rebellion, and afterwards several other pieces. In 1717 he was engaged in a dispute with Dr William Nicholson, bishop of Carlisle, relating to some alterations in a sermon by the Bishop of Bangor; and he disliked the proceedings of the convocation against that bishop. Upon the death of Dr Cumberland, bishop of Peterborough, he was promoted to that see, to which he was consecrated in the year 1718. He sat in it more than ten years, and died in 1728. He was an excellent philologist, a good preacher, and well versed in the history and antiquities of our nation.

Kennet, *Basil*, a learned English writer, brother of the preceding, was educated in Corpus Christi College, in the university of Oxford, where he became fellow. In 1706 he went as chaplain to the English factory at Leghorn, where he met with great opposition from the Papists, and was in danger from the inquisition. Kennet died in the year 1714. He published Lives of the Greek poets, Roman Antiquities, a volume of Sermons preached at Leghorn, and a translation into English of Puffendorf's Treatise of the Law of Nature and Nations. He was a man of most exemplary integrity, generosity, piety, and modesty.

KENNICOTT, Dr Benjamin, well known in the learned world for his elaborate edition of the Hebrew Bible and other valuable publications, was born at Totness, in Devonshire, in the year 1718. His father was the parish clerk of Totness, and once master of a charity school in that town. At an early age young Kennicott succeeded to the same employment in the school, being recommended to it by his remarkable sobriety and premature knowledge. It was in this situation he wrote the verses on the recovery of the honourable Mrs Courtney from a dangerous illness, which recommended him to her notice, and that of many neighbouring gentlemen, who, with laudable generosity, opened a subscription to send him to Oxford. In judging of this performance, they may be supposed to have considered not so much its intrinsic merit, as the circumstances under which it was produced. For although it might justly claim praise as the fruit of youthful industry struggling with obscurity and indigence, yet as a poem it never rises above mediocrity, and generally sinks below it. But, in whatever light these verses may be considered, the publication of them was soon followed by such contributions as procured for the author the advantages of an academical education. In the year 1744 he entered himself at Wadham College: and it was not long before he distinguished himself in that particular branch of study in which he afterwards became so eminent. His two dissertations, on the Tree of Life, and the Oblations of Cain and Abel, came to a second edition as early as the year 1747, and procured him the singular honour of a bachelor's degree conferred upon him gratis by the university a year before the statutable time. The dissertations were gratefully dedicated to those benefactors whose liberality had opened his way to the university, or whose kindness had made it a scene not only of manly labour, but of honourable friendship. With such merit and such support, he proved a successful candidate for a fellowship of Exeter College; and soon after his admission into that society, he distinguished himself by the publication of several occasional sermons. In the year 1753 he laid the foundation of that stupendous monument of learned industry, at which the wise and the good will gaze with admiration, when the cavils of prejudice, and envy, and ingratitude, shall no longer be heard. This he did by publishing his first dissertation, on the state of the printed Hebrew text, in which he proposed to overthrow the then prevailing notion of its absolute integrity. The first blow, indeed, had been struck long before by Capellus, in his *Critica Sacra*, published after his death by his son, in 1650; a blow which Buxtorf, with all his abilities and dialectical skill, was unable to ward off. But Capellus having no opportunity of consulting manuscripts, though his arguments were supported by the authority of the Samaritan Pentateuch, and that of parallel passages and the ancient versions, could never absolutely prove his point. Indeed the general opinion was that the Hebrew manuscripts contained none, or at least very few and trifling variations from the printed text; and with respect to the Samaritan Pentateuch, the most opposite opinions were entertained. Those who held the Hebrew verity, of course condemned the Samaritan as corrupt in every place where it deviated from the Hebrew; and those who believed the Hebrew to be incorrect, did not think the Samaritan of sufficient authority to correct it. Besides, the Samaritan itself appeared to very great advantage; for as no Samaritan manuscripts were then known, the Pentateuch itself was rashly condemned for errors which ought rather to have been ascribed to the incorrectness of the editions. In this dissertation, therefore, Dr Kennicott proved that there were many Hebrew manuscripts extant, which, though they had hitherto been generally supposed to agree with one another, and with the Hebrew text, yet contained many and important various readings; and that from those various readings considerable authority was derived in support of the ancient versions. He announced the existence of six Samaritan manuscripts in Oxford alone, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many passages in the Hebrew might undoubtedly be corrected. This work, as might reasonably be expected, was examined with great severity both at home and abroad. In some foreign universities the belief of the Hebrew verity, on its being attacked by Capellus, had been insisted on as an article of faith. "Ista Capelli sententia adeo non approbata fuit fidei sociis, ut potius Helvetii theologi, et speciatim Genevenses, anno 1678, peculiari canone caverint, ne quis in ditione sua minister ecclesiæ recipiatur, nisi fateatur publice textum Hebræum, ut hodie est in exemplaribus Masoreticis, quoad consonantes et vocales, divinum et authenticum esse."[1] And at home this doctrine of the corrupt state of the Hebrew text was opposed by Comings and Bate, two Hutchinsonians, with as much violence as if the whole truth of revelation had been at stake.

The next three or four years of Dr Kennicott's life were principally employed in searching out and examining Hebrew manuscripts, though he found leisure not only to preach, but also to publish several occasional sermons. About this time Dr Kennicott became one of the king's preachers at Whitehall; and in the year 1759 we find

[1] Wolfii *Biblioth. Heb.* tom. ii. p. 27.

him vicar of Culham in Oxfordshire. In January 1760 he published his second dissertation on the state of the Hebrew text, in which, after vindicating the authority and antiquity of the Samaritan Pentateuch, he disarmed the advocates for the Hebrew verity of one of their most specious arguments. They had observed that, the Chaldaic Paraphrase having been made from Hebrew manuscripts near the time of Christ, its general coincidence with the present Hebrew text must evince the agreement of the latter with the manuscripts from which the paraphrase was taken. Dr Kennicott demonstrated the fallacy of this reasoning, by showing that the Chaldaic Paraphrase had been frequently corrupted, in order to reconcile it with the printed text; and thus the weapons of his antagonists were successfully turned against themselves. He appealed also to the writings of the Jews themselves upon the subject of the Hebrew text, and gave a compendious history of it, from the close of the Hebrew canon down to the invention of printing; together with a description of a hundred and three Hebrew manuscripts which he had discovered in England, and an account of many others preserved in various parts of Europe. A collation of the Hebrew manuscripts was now loudly called for by the most learned and enlightened friends of biblical criticism; and in the same year, 1760, Dr Kennicott issued his proposals for collating all the Hebrew manuscripts prior to the invention of printing, which could be found in Great Britain and Ireland, and for procuring at the same time as many collations of foreign manuscripts of note as the time and money he should receive would enable him to procure. His first subscribers were the learned and pious Archbishop Secker, and the delegates of the Oxford press, who, with that liberality which has generally distinguished them, gave him an annual subscription of L.40. In the first year the money received was about five hundred guineas; in the next it rose to nine hundred, at which sum it continued stationary till the tenth year, when it amounted to one thousand. During the progress of this work, the industry of our author was rewarded by a canonry of Christ Church. He was also presented, though we know not exactly when, to the valuable living of Mynhenyote, in Cornwall, upon the nomination of the chapter of Exeter. In 1776 the first volume was published, and in 1780 the whole was completed. If we consider that above six hundred manuscripts were collated, and that the whole work occupied twenty years of Dr Kennicott's life, it must be owned that sacred criticism is more indebted to him than to any other scholar of his age. Within two years of his death he resigned his living in Cornwall, from conscientious motives, on account of his not having a prospect of ever again being able to visit his parish. Although many good and conscientious men may justly think, in this case, that his professional labours, carried on elsewhere, might properly have entitled him to retain this preferment, and may apply this reasoning in other cases, yet conduct so signally disinterested certainly deserves to be admired and celebrated. Dr Kennicott died at Oxford, after a lingering illness, on the 18th of September 1783; and he left a widow, who was sister to Mr Edward Chamberlayne of the treasury. At the time of his death he was employed in printing Remarks on Select Passages in the Old Testament, which were afterwards published, the volume having been completed from his papers.

KENNINGTON, a hamlet adjoining to London, in the parish of Lambeth, in Surrey, a mile and a half from Westminster Bridge. It is one of those places in the vicinity of the metropolis which of late years have vastly increased in opulence and appearance. Two new churches, and numerous substantial houses, have been built. A palace formerly stood within it, which was inhabited by several of our monarchs, the last of whom was Henry the Eighth. It was destroyed in the civil war under Charles the First. A canal has been carried on to this place from the Thames, by which coals and other heavy articles are conveyed to it at a cheap rate.

KENRICK, William, an author of considerable ability, was the son of a citizen of London, and brought up, it is said, to a mechanical employment. This, however, he seems early to have abandoned, and to have devoted his talents to the cultivation of letters, by which he supported himself during the rest of a life which might be said to have passed in a state of warfare, as he was seldom without an enemy to attack or to defend himself against. He was for some time a student at Leyden, where he received the degree of doctor in both laws. Not long after his return to England, he attracted some notice as a poet by Epistles Philosophical and Moral, 1759, addressed to Lorenzo; an avowed defence of infidelity, written whilst under confinement for debt, and with a declaration that he was "much less ambitious of the character of a poet than of a philosopher." From this period he became a writer by profession; and the Proteus shapes under which he appeared it would be a fruitless attempt to trace. He was for a considerable time a writer in the Monthly Review; but having quarrelled with his principal, he began a new review of his own. When Dr Johnson's edition of Shakspeare first appeared in the year 1765, it was followed in a fortnight by a pamphlet, entitled a Review of Dr Johnson's new Edition of Shakspeare, in which the ignorance or inattention of that editor is exposed, and the poet defended from the persecution of his commentators. This pamphlet was followed by an examination of it, and that by a Defence in 1766, in which year he produced his pleasant comedy of Falstaff's Wedding, at first intended to have been given to the public as an original play of Shakspeare retrieved from obscurity, and which, it must be acknowledged, is a happy imitation of the great dramatic bard. With the celebrated English Roscius Dr Kenrick was at one time on terms of the strictest intimacy; but he took occasion to quarrel with him in print, and in a mode too unmanly to be mentioned. In politics also he made himself not a little conspicuous, particularly in the dispute between his friends Wilkes and Horne. He was the original editor of the Morning Chronicle; but being ousted for neglect, he set up a new one in opposition. He translated in a very able manner the *Emile* and the *Héloise* of Rousseau; the Elements of the History of England by Millot; and produced several dramatic performances, together with an infinite variety of publications both original and translated. To him also the public are indebted for the collection, imperfect as it is, of the poetical works of Robert Lloyd, 1774, in two vols. 8vo. Dr Kenrick died on the 9th of June 1777.

KENSINGTON, a large parish, whose boundary joins to London, in the hundred of Ossulton, in the county of Middlesex. It is chiefly remarkable for the royal palace and gardens, the latter of which forms the scene of the recreation of the inhabitants of the metropolis. The palace is an irregular brick building, purchased by William the Third, and by him and his successors enlarged in various styles. Though with little exterior taste, it has good suites of apartments allotted to junior members of the royal family, and to other persons. The gardens have received all the advantages of which their situation is capable, and form a most pleasing promenade. Holland House and other mansions are objects of remark within this parish, as well as the numerous smaller buildings erected within the last twenty years. The inhabitants amounted in 1801 to 8556, in 1811 to 10,386, in 1821 to 14,428, and in 1831 to 20,902.

KENT, a maritime county in England, and, reckon-

Kent.

ing its population, extent, and fertility, perhaps the first in the island. It is in a peninsular form, being bounded by the British Channel on the south; by the German Ocean on the east; by the river Thames, which divides it from Essex, on the north; and by the counties of Surrey and Sussex on the west. Its length is sixty-six, and its breadth thirty-six miles. The area is calculated at about 1300 square miles.

The divisions of Kent are into five laths, which are subdivided into sixty-three hundreds and fifteen liberties, and contain two cities, thirty-six towns, and 414 parishes.

The population, at the four decennial enumerations, amounted in 1801 to 307,624, in 1811 to 373,095, in 1821 to 426,016, and in 1831 to 479,155. At the last census the males were 234,572, and the females 244,583. These are comprehended in 97,142 families, of whom 31,667 are chiefly employed in agriculture, 29,419 are occupied in trade, manufactures, and handicraft, and 36,056 are not included in either of the other classes. The number of males above twenty years of age employed in retail trade or in handicraft, or masters or workmen, was 34,257.

The baptisms, burials, and marriages, show the following proportion at different periods, in the parish register:—

	One Baptism in	One Burial in	One Marriage in
1796 to 1800	30	41	116
1806 to 1810	29	38	115
1816 to 1820	31	51	130
1826 to 1830	34	49	143

Thus it is seen that the increase of population has been going on rather by a greater degree of longevity than by the increase of births. The only scale of morals which our present statistical knowledge supplies is that regarding chastity, by showing the proportion which the number of illegitimate children bears to the whole of the births. The illegitimates in Kent have only been one in twenty-four, whereas in the whole of England they were one in twenty; in the whole of Wales, one in thirteen; and in England and Wales taken together, one in nineteen.

The cities of Kent are two, and the towns whose houses and population exceed 3000 inhabitants, are—

Cities.	Houses inhabited.	Inhabitants.
Canterbury	3033	13,649

Sandwich	595	3,136

By the law of 1832, entitled an act to amend the representation of the people of England, the county of Kent has been divided into the eastern and western parts. The election for the first of these is held at Canterbury, and the other polling places are Sittingbourne, Ashford, New Romney, and Ramsgate. The election for the second or western division is held at Maidstone, and the other polling places are Bromley, Gravesend, Tonbridge, and Cranbrooke. By the same act, the boroughs of New Romney and of Queenborough have been disfranchised; and the borough of Hythe, which before returned two members, can in future elect but one, and, to make up the competent constituency, the town of Folkstone has been added to it. Greenwich has by the same law been erected into a borough, and returns two members; and Chatham is also a borough returning one. The other places, viz. Canterbury, Rochester, Dover, Maidstone, and Sandwich, return, as before, two members each. Thus the representation consists of four members for the county, and fourteen for the cities and towns.

The extent of land in the county appears to be 996,480 acres when the whole area is included; but, from some not ascertainable cause, the returns from the several parishes show only 972,240 acres. The annual value of the land, including that of the houses, was taken in 1815, for the purpose of the property tax, at L.1,644,179. The whole of the poor-rates levied in 1833 amounted to L.450,851; and it had not much varied in the few preceding years.

The appearance of Kent is generally acknowledged to be equal, if not superior, in beauty, to that of any other British county. Its surface is gently undulating; none of its hills, except on the coast, rise abruptly, nor reach a great elevation. In all the valleys there are streams of water; the woods and trees enrich the scenery, and the mixture of pasture and corn land, interspersed with orchards, fruit-trees, and hop plantations, give to its beauties a character of softness and grace.

The Thames may be considered as a Kentish river, as it washes its whole northern boundary, and empties itself into the sea on its shores. The river next in importance is the Medway, formed by the junction of four small streams, one only of which rises within the county. It becomes navigable for large barges at Tunbridge, and continues its course by Maidstone to Chatham, where ships of the largest size can approach the shore; and there terminates its course, by joining the Thames at the Nore, beyond the arsenal of Sheerness. The Greater Stoure, the Lesser Stoure, the Rother, the Cray, the Darent, and the Ravensbourne, are small rivers, none of them navigable, but all of great benefit, by the fertility they communicate to the meadows on their banks, and by the power they afford to the many mills erected upon their banks.

Kent is almost exclusively an agricultural county; and though the soil is generally fertile, and though there are few extensive tracts of barren or uncultivated land, yet no part of the kingdom exhibits within so small a compass so great a variety of soils, of productions, and of modes of cultivation. It has been judiciously divided into eight districts for the purposes of agricultural description. The first of these, the Isle of Thanet, is in the north-west angle of the county. The soil is a light mould on a chalky bottom, and has been highly enriched by the marine substances that have been administered as manure. The whole island contains 23,000 acres of arable and 3500 acres of rich marsh land. The most common rotation of crops is fallow, sometimes with, sometimes without, a crop of peas: this is followed by barley, clover, and wheat; and on some soils rather heavier, the course pursued is beans, wheat, and barley. The barley of this district is very much esteemed, and sought for as seed in other countries. Besides the common grains, seeds of various kinds are raised for sale to the London seedsmen, particularly canary, radish, spinach, mustard, and onion seed. The soil in the marshy parts of the island is a mixture of clay, sea sand, and small shells, and yields most abundant pasture.

The upland farms of East Kent, which surround Canterbury, and extend to Dover on one side and Ashford and Rochester on the other, are an open and dry tract of corn land, intermixed with woods. The soils are very various, all resting on a subsoil of chalk. Some of them are very heavy loamy clays, with a great quantity of flint stones on the surface: these are usually cultivated on a four-course rotation of fallow, barley, beans, and wheat; when the soil is somewhat stiffer, a variation occurs of fallow, wheat, beans, and oats. In this district the harvest usually commences from twelve to fourteen days later than in the Isle of Thanet. The woods in this district usually supply poles to the hop-planters in the vicinity; they are cut down after from ten to fourteen years' growth. There are in this division some few hop grounds, but they are confined to three or four parishes. In the vicinity of Sandwich, Faversham, and Deal, a portion of land, of a rich sandy loam, receives an almost uniform cultivation; it is nearly all under the plough, and a four-course rotation is practised, of wheat, beans, barley, and oats, after a fallow, or sometimes canary occupies the place of wheat. Some portions of this land are alternately cropped with beans and wheat, or beans and canary. In the vicinity of Sandwich are many orchards, the apples of which are partly sent to London, and partly furnish return cargoes to the vessels that come laden with coals from Newcastle and Sunderland.

The district extending from Maidstone to Canterbury, and thence to Sandwich, is the great garden-tract for the growth of hops. The soils on which hops are produced are very various: the most productive are those which have a deep loam surface, with a subsoil of deep loamy brick earth; some of these have a considerable quantity of flint-stones mingled with the soil, and, when it becomes compact, almost covering it. Another soil, provincially called stone shalten, is very good for the growth of hops; it is mixed with many small portions of stone and sand, and rests upon the basis of the stone called Kentish rag, which is burned into excellent lime. The cultivation of hops is a very fluctuating pursuit, as the produce varies in different years from two to fifteen hundredweight per acre, and the prices have varied from three to fifteen pounds. The expense of cultivation is very great, from the quantity of manure that is required, from the great expense of the poles round which the plants twine, and the labour of keeping the ground clear and of picking the hops. Besides hops, the district is very productive of apples, cherries, and filberts, to the growth of which many fields, from one to ten acres in extent, are devoted: part of the apples are made into cider; the remainder, with the cherries and filberts, are principally conveyed to the different markets in London.

The Isle of Sheppey is separated from the rest of Kent by an arm of the sea called the Swale, which is navigable for ships of 200 tons burden. Its length is eleven, and its breadth eight miles. About four fifths of this island is either marsh or dry pasture-land; upon the former many oxen are fattened, and the latter is appropriated to the breeding and feeding of sheep. About 10,000 acres of this island is arable land, of great fertility, usually cultivated with beans and wheat in alternate years, with occasionally a fallow before the beans. This land is highly fertile, the wheat raised on it being considered as the best that is brought to London, a bushel frequently weighing sixty-four pounds. This great productiveness may be in some measure owing to the practice of applying to the natural heavy clayey soil a frequent dressing of the cockle shells which are washed on the beach by the sea. It is not unusual to apply thirty cart-loads of these shells to an acre of land. The uplands of West Kent are extensive and various in their soils. This part is more woody and enclosed than East Kent. The ridge of the chalk hills, about six or seven miles in breadth, consists of a stiff clay, with many surface flints, and requires six horses frequently to plough it. On these soils the most common rotation is a year's clean fallow, then wheat, clover, wheat, and oats. Many large flocks of South Down sheep are kept on this hilly range. The valleys and the sides of the hills are lighter soil and easier to work, but do not produce better corn; some of this, but not to a great extent, is cultivated for hops.

The district known as the Weald of Kent was, in former times, an immense forest, desolate of inhabitants, and only occupied by wild swine and deer; and though it is now filled with towns and villages, and well peopled, the woods that remain are extensive; exhibiting some pleasing landscapes, where seats, farms, and villages, are mixed with cultivated fields, and woods of spreading oaks. The roads in this district are very bad, many of them impassable for carriages in the best seasons; and, in winter, horses can only travel by keeping on the narrow paved tracts that are formed by the sides of the highways. The soil is principally clay, with a substratum of marl, in some places very heavy, but in others sufficiently light to be ploughed with oxen. This district produces wheat, oats, barley, rye-grass, clover, and beans; but so various are the rotations, that it is scarcely possible to generalise them. The pastures are very rich and fertile, and fatten annually great numbers of cattle. In the western part of this district, and in the adjoining Weald of Sussex, there were formerly many iron-works: the ore is found, and the abundance of wood made the manufacturing of it profitable; but the substitution of coke for charcoal in making iron has put a final stop to all the iron-works of Kent and Sussex.

The last agricultural division is a rich, level, extensive tract of land, on the southern coast, containing about forty-five thousand acres of the richest pasture in the united kingdom. This level is protected from the violence of the sea, and from inundations, by a dyke of earth of very great thickness, called Dimchurch-wall. The whole is alluvial land, consisting of a fine, soft, rich loam, with portions of sea-sand and broken shells intermixed. The subsoil consists of alternate layers of sand and clay mixed with shells, amongst which are sometimes found large oak trees in various positions, the wood of which is as black and as hard as ebony. On this plain there are two towns, Romney and Lydd, but scarcely any villages, and few other houses than those of the shepherds and herdsmen who attend upon the numerous cattle that graze on the marshes.

As there are no other fences but dykes, or posts and rails, from the surrounding heights it has the appearance of one large verdant field covered with sheep and oxen. The breeding and fattening of sheep is the principal purpose to which this level is appropriated, and the number bred is greater than on any other tract of the same extent in the kingdom. The sheep take their denomination from the district; they are larger than the South Downs, but not of a size equal to the Lincolnshire sheep. Their flesh is highly esteemed in the London markets, and their wool is both fine and of a long fibre; the average weight of the fleeces being about five pounds.

The landed property of Kent is much divided; there are some noblemen that have large, but none such vast estates as to give a preponderating political influence. The number of freeholders exceeds ten thousand, enjoying estates from the smallest value that can give a vote, and gradually rising to L.7000 or L.8000 per annum. The copy-hold tenures are very few, and the peculiar tenure of Kent, known as *gavel-kind*, is very much diminished by various legal operations.

The chief manufactures carried on in this county are those connected with the building and equipping of ships and boats. The males above twenty years of age employed in the several branches of ship-building, block, rope, and sail making, amount to 2120; to which are to be added, nearly as many plumbers, glaziers, painters, joiners, ironmongers, copper-smiths, and other trades who are occupied more in shipping than in other kinds of business. The larger operations of the kind are carried on in the king's yards at Deptford and Woolwich; but there are many private yards for building and repairing ships on the south bank of the Thames. At Woolwich, the great manufactory of warlike stores, for the use of the artillery chiefly, gives occupation to many labourers exclusively of the soldiers. There mortars and brass cannon are cast, bored, and mounted, the different kinds of shot prepared, and all the various combustibles used in war compounded; and in the dockyard at that place, some of the largest ships of war are always building or repairing. In Chatham, and at Rochester, the chief manufactories are those of the government, either for the navy or for the ordnance department. The private manufacturing establishments are not either numerous or extensive. The largest in value is paper, which is made at Maidstone and near Dover, of the best quality; but in other parts, where the water is adapted for the purpose, that trade is carried on; some especially near Westerham. The whole number of males above twenty years of age employed in making paper are 531, of whom 147 reside in the town of Maidstone. The grinding of wheat is a considerable trade, from the goodness of the wheat grown here, and the slight expense of conveying the flour by water to the great market of the metropolis. Some printing of calicoes is carried on, upon the banks of the river Cray. The principal of these works are at Crayford, where 124, and at Bexley, where forty males, above twenty years of age, are employed; but this trade, like that of making paper, gives occupation to many more females than males. At Dartford there are some large manufactories of gunpowder; at Deptford, of several chemical preparations; at Greenwich, of machinery and of combs; and at Maidstone, of bagging for hops.

One of the proudest ornaments of the nation, Greenwich Hospital, for the relief of disabled or aged seamen, is in this county; and, in the park contiguous to it, the Royal Observatory, to which the eyes of all the navigators of Europe are directed, as the place from which issues the nautical ephemeris, which all nations depend on when traversing distant seas.

Though Kent is bounded on three sides by the ocean and the river Thames, it has scarcely any foreign commerce. The harbours are none of them good; those of Dover and Ramsgate are formed by artificial piers, and the former is dry at low water when the sluices are open. The only trade from Dover is to Calais, Dunkirk, and Ostend, for such light goods as can bear the expense of land-carriage. There is a herring fishery conducted from Folkstone; besides which, the principal foreign trade consists in smuggling those various articles whose high duties offer a temptation to encounter such perilous adventures.

The sea-shores in this county invite numerous visitors, who frequent and fill various towns during the warm months of summer. The principal of these are Margate, Ramsgate, and Broadstairs; but, besides these, many of the smaller places on the coast are resorted to for purposes of health or amusement. On the western side of the county, the waters of Tunbridge have long been celebrated; and though the influence of fashion has erected into rivals several other Spas, yet the company that still resort to it is both numerous and respectable.

(See Marshall's *Survey*; Boys's *Survey*; Brayley's *Beauties of England and Wales*; and Hasted's *Kent.*)

KENTIGERN, St, or St Mungo, a famous saint of the Catholic church, who flourished in Scotland in the sixth century, and is said to have been of the royal blood of both Scotch and Picts, being the son of Thametis, the daughter of Loth king of the Picts, by Eugene III. king of Scotland. The bishoprics of Glasgow and St Asaph were founded by him in 560. He obtained the appellation of *Mungo* from the affection of his tutor St Serf or Servanus, bishop of Orkney, who called him *Mongah*, which in the Norwegian language signifies *dear friend*.

KENTISH Town, a hamlet of the parish of Pancras, in the hundred of Ossulton, in the county of Middlesex. It has of late so much extended its buildings, that it almost forms a suburb to the metropolis. It is finely situated in a valley, beginning between the hills of Hampstead and Highgate; and being deemed a remarkably healthy spot, is much occupied with country residences of persons connected with London; and within the last ten years it has assumed an elegant appearance. There is a chapel of ease, and some dissenting places of worship.

KENTON, a parish of the county of Devon, in the hundred of Exminster, 178 miles from London. It is situated on the river Ex, where the Ken falls into that stream. The inhabitants amounted in 1801 to 1639, in 1811 to 1793, in 1821 to 1891, and in 1831 to 2050.

KENTUCKY, one of the United States of North America, is bounded on the north by the river Ohio, which separates it from Ohio, Illinois, and Indiana; on the east by Virginia; on the south by Virginia and Tennessee; and on the west by the river Mississippi. It extends from long. 81. 50. to 89. 29. W., and from lat. 36. 30. to 39. 10. N. Its extreme length is 380 miles, its medium breadth is about 100, and it contains an area of 38,000 square miles.

Kentucky is said to possess larger quantities of fertile land than any other western state; and, for beautiful variety of hill and dale, the general excellence of the soil, and picturesqueness of landscape scenery, including fine forests, and numerous streams and rivers, few countries surpass it. Yet there are in this state large sterile tracts, and a good deal of land either too mountainous or too poor for cultivation. The Allegany Mountains stretch along its eastern and south-eastern boundary, and branches from that chain penetrate into the counties contiguous to Tennessee and Virginia, rendering them broken and hilly. These offshoots from the larger mountains wind round the basis of the small table hills, and open up into frightful chasms, shaded by the gigantic poplar. A tract from five to twenty miles wide along the banks of the Ohio has the same character, but it is interspersed with fertile valleys. Between this strip of land, Green River, and the eastern counties, lies what has been called the garden of the state; it is the most populous part, and is distinguished for its beauty and fertility. It has a finely diversified or rolling surface, the soil is excellent, and there is abundance of timber and grape vines. It is about one hundred and fifty miles in length, and from fifty to one hundred in breadth. From three to ten feet beneath the surface, there is a substratum or floor of limestone. A great quantity of this mineral in a dissolved state is intermixed with the soil, and imparts to it a warm and forcing quality, highly favourable to the progress of vegetation. Much of it belongs to that species of soil technically called "mulatto land." Through this beau-

Kentucky. tiful country meander the Little Sandy, Licking, Kentucky, and Salt Rivers, with their numerous tributaries. There are a few precipitous hills, but no elevations of a magnitude sufficient to entitle any part of it to the character of mountainous. The woods have a very fine appearance, and seem as if they had been promiscuously arranged for a pleasure ground. Grape vines of vast size climb the trees, and overshadow the verdure beneath with their umbrageous leaves. Black walnut, black cherry, honey-locust, buck-eye, pawpaw, sugar-tree, mulberry, elm, ash, hawthorn, coffee-tree, and the grand yellow poplar trees which indicate the richest soil, are everywhere abundant. When the country was first settled, it was covered with a thick cane brake; but this has now given place to a beautiful grass sward. In the early part of spring, the May-apple throws out its rich and beautiful verdure in abundance, which, along with the purple and redundant flowers of the red bud, and the fine white blossoms of the dogwood, impart a delightful charm to the landscape. The trees are not in general large, but tall, straight, and tapering at the top. Innumerable branches wind amongst the copses; and in the declivities numerous springs of water, impregnated with lime, gush forth. In the south-western part of the state, between Green and Cumberland Rivers, there is a large tract of country, called "barrens," covered with grass like a prairie, and affording a fine range for cattle. Within these few years it has been planted with different kinds of trees, which, however, do not check the growth of the grass, or an infinite variety of plants, which enamel the sward, and during spring and summer flower in all the wild and luxuriant beauty of a western wilderness. Spread over this district are an immense number of small conical hills, called "knobs," covered with shrubby and post oaks. The soil is of an excellent quality, being a mixture of clay loam and sand; and fine tobacco is raised by many of the farmers. Of this state in general, an American writer observes: "For variety of hill and dale, for the excellence of the soil, yielding in abundance all that is necessary for comfortable subsistence, for amenity of landscape, beauty of forest, the number of clear streams and fine rivers, health, and the finest development of the human form, and patriarchal simplicity of rural opulence, we question if any country can be found surpassing Kentucky."[1]

A long extent of the northern frontier of this state is washed by the Ohio River; and the Mississippi passes a considerable part of the south-western boundary. Most of the rivers which have their origin within the limits of Kentucky rise in the southern part of it, and flow in a northerly direction into the Ohio. The river from which the state derives its name rises in the south-eastern portion, and interlocks with the head waters of Licking and Cumberland Rivers, the former having its origin in the north-east, and the other in the south-east corner. The Kentucky is an important stream, navigable for one hundred and eighty miles during winter, with a rapid current, and high, and in some parts perpendicular, banks of limestone. It takes a north-west course, and joins the Ohio at Port William, seventy-seven miles above Louisville, after receiving various tributary streams. Licking waters a rich and well-settled country, and, after a sinuous course of two hundred miles, enters the Ohio at Newport, opposite Cincinnati. Cumberland River waters eighty miles of this state, when it enters Tennessee; but crosses again into Kentucky, and, after running fifty miles in it, once more returns to Tennessee, which it leaves a second time to traverse the sister state. The river Big Sandy rises in the Allegany Mountains, and forms the eastern boundary of the state for nearly two hundred miles. During its progress it receives a great number of large creeks, and, before it enters the Ohio, separates into two branches or forks. It is navigable for a considerable distance. Green River is boatable for two hundred miles, and receives a great number of tributaries in its course. Salt River is boatable for one hundred and fifty miles, and, traversing four counties, enters the Ohio twenty miles below Louisville. There are a great many mineral springs, possessing medicinal qualities, some of which are really valuable. A fountain of petroleum, vulgarly called mineral oil, was discovered at the depth of one hundred and eighty feet, whilst the ground was being pierced to obtain salt water. When the auger was withdrawn, the unctuous matter sprung perpendicularly upwards in a continued stream, more than twelve feet above the surface of the earth. The rocks of this state are said all to belong to the secondary formation. Limestone and marble of the most beautiful species abound. Coal has been discovered in some places, especially along the Ohio. Iron ore is very abundant, and wrought to a considerable extent. Lead, copperas, and aluminous earths are likewise found. There are a number of salt springs, from which salt was formerly obtained; but it is now found more profitable to import it from other states. The soil of Kentucky is strongly impregnated with nitre; and it has been affirmed that fifty pounds of that salt, in a crude state, have been obtained from only double the quantity of earth. There are many natural curiosities and antiquities in this state; the limestone caves in particular excite the astonishment of all who visit them. One, styled Mammoth Cave, in the south-western part, one hundred and thirty miles from Lexington, on the road leading to Nashville, is said to be eight or ten miles in length, with a great number of avenues and windings. The famous cave of Antiparos is nothing to this stupendous subterranean cavity. A number of the rivers have excavated the earth, so as to form abrupt precipices, deep glens, and frightful gulfs. The precipices formed by Kentucky River are in many places awfully sublime, presenting perpendicular banks of three hundred feet of solid limestone, surmounted with a steep and difficult ascent four times as high.

Amongst the antiquities of Kentucky are great numbers of those Indian mounds which are scattered over all the western territory. Human bodies have been found in a state of entire preservation in several caves; they are said to be considerably smaller than the men of modern times.

The fertile soil of Kentucky produces all the grains, pulses, and fruits of the temperate climates, in great abundance; and, in the south-western counties, near and on the Tennessee, Cumberland, and Mississippi Rivers, cotton is grown. Hemp, tobacco, and wheat are the staple productions, but Indian corn is the principal grain raised for home consumption. Rye, oats, buck-wheat, barley, flax, potatoes, and other culinary vegetables, are cultivated. Apples, pears, peaches, cherries, and plums, are the most common fruits; but grapes are raised in many places, and there are vineyards where wine is made. This state is distinguished for its breed of domestic animals, particularly the horse, which is of the noblest kind, and reared in great numbers. These, along with mules, horned cattle, and swine, are annually driven to the neighbouring states for a market. The fattening of animals is the chief mode of consuming the surplus grain, on account of the expense of conveying it to market. Considerable quantities of whisky are made; and, from its position and fairs, Kentucky has become a manufacturing state. The present exports are chiefly to New Orleans, though a considerable quantity of produce and manufactures ascends

[1] *The History and Geography of the Mississippi Valley*, by Timothy Flint, p. 348.

Kentucky. the Ohio to Pittsburgh. The growers of the produce of this state, after arriving at New Orleans, frequently ship it on their own account to the Atlantic states, to Vera Cruz, and the West Indies. Besides the articles above mentioned, there are sent out of this state immense quantities of flour, lard, butter, cheese, pork, beef, Indian corn, and meal; whisky, cider, cider royal, fruit both fresh and dried; and various kinds of domestic manufactures.

With regard to the amount of the exports of surplus produce, an American writer on commerce observes, "from that part of the state of Kentucky which lies north and east of Kentucky River, and a few countries bordering on its south side, the exports in 1832 were valued as follows, viz.

Hogs, alive, and in pork, bacon, lard	1,000,000 dollars.
Horned cattle	200,000
Horses and mules	500,000
Hempen fabrics	750,000
Tobacco	150,000
Iron castings, pigs and bars	50,000
Wool, ginseng, &c	100,000
Total	2,750,000

Estimating the surplus produce of the remainder of Kentucky at two millions and a half, we shall have for that state 5,250,000 dollars."[1]

Kentucky is divided into eighty-three counties, each having a county town. Frankfort, the political metropolis of the state, is situated on the north bank of the Kentucky, sixty miles above its confluence with the Ohio. Long. 84. 40. W. Lat. 38. 14. N. The site of the town is a semicircular plain, some two hundred feet lower than the table-land in its rear. The environs of the plain are remarkable for their romantic and splendid scenery. The river is here about eighty yards wide, flowing between banks four or five hundred feet high, and dividing the town into about two equal parts, which are connected by a bridge. Amongst other public buildings, are the state-house, court-house, penitentiary, jail, three churches, an academy, and a county court-house. The state-house is entirely built of marble, and contains the customary legislative halls, and other apartments. This town contains rope-walks, cotton bagging manufactories, a cotton factory, tobacco warehouses, powder-mills, and other establishments. Being at the head of steam-boat navigation on the river, it is a place of considerable commercial enterprise. The population amounts to 4000.

Lexington, the largest and wealthiest town of the state, is finely situated, twenty-five miles east-south-east of Frankfort, in a beautiful valley on Town Fork, a small stream which falls into the southern branch of Elkhorn River. It is regularly laid out, and contains many large and handsome buildings. Those of a public nature are, the court-house, a handsome and spacious edifice; the bank; a large masonic hall; a spacious and commodious lunatic asylum; a number of churches, in which all denominations of Christians are represented; a market-house; an academy; and the Transylvania university, which has a high reputation. The manufactures of woollen, paper, and cotton are considerable; but the articles chiefly made are cotton-bagging, and various kinds of cordage, particularly bale-rope. Of the former there were manufactured, in 1830, 1,000,000 yards, and of the latter 2,000,000 pounds. The environs of this town are much admired for their beauty and cultivation; and they are adorned with a great number of handsome villas and ornamented rural mansions. The growth of Lexington has been very rapid. In 1797 it contained only about fifty houses; and the last census gives a population of 6104. Long. 84. 18. W. Lat. 38. 6. N.

Louisville, in a commercial point of view, is by far the most important town in the state. It is situated opposite the falls of the Ohio, fifty miles west of Frankfort; and its locality gives it the advantage of being the great outlet of a large portion of the surplus produce of the state. It is regularly laid out, and is three miles in length by upwards of one in breadth. The public buildings are, a court-house, jail, a number of houses of public worship, a poor-house, free public school house (a fine edifice), a marine hospital (a conspicuous and showy building), a bank, a theatre, and others of less importance. The private buildings are mostly of brick; and the warehouses, particularly those recently erected, are very extensive. Manufactures are as yet comparatively in their infancy. There is one manufactory of cotton and one of woollen, three iron founderies, a steam-engine factory, tanneries, hat, saddle, and shoe making establishments, and the like. The exports are, tobacco, whisky, cotton bagging and baling, hemp, flour, pork, bacon, lard, and many other productions of the country. The imports are various and extensive, the easy circumstances of many of the people creating a large demand for foreign articles of comfort and luxury. The commerce is carried on by upwards of three hundred steam-boats, some of which are daily arriving from or departing for all parts of the immense valley of the Mississippi. Amongst the public works connected with this rising town, is the Louisville and Portland Canal, which is two miles in length, and calculated to admit of the passage of the largest steam-boats on the western waters. Its top-water line is two hundred feet, its bottom fifty feet, and its depth varies from four to forty-two feet. Its sides are sloping and paved with stone, and it has over it a beautiful stone bridge between Louisville and Portland. Its locks consist of a guard-lock and three lift-locks, which are larger than any in the United States. It cost 940,000 dollars, and was opened on the first of January 1831. An idea of the extent of the commerce carried on by means of this medium of inland navigation may be formed from the following statement of the number of steam-boats, and flat and keel boats, which passed in 1832, 1833, and one half of 1834:—1832, 453 steam-boats, 179 flats and keels, 70,109 tons; 1833, 875 steam-boats, 710 flats and keels, 169,885 tons; first half of 1834, 630 steam-boats, 139 flats and keels, 98,122 tons.

The county of which Louisville is the capital is one of the most fertile and best settled in the state, and the town is considered as one of the greatest thoroughfares in the union. The city government consists of a mayor and city council, chosen annually by the *viva voce* vote of all residents in their respective wards. The census of 1830 assigns to it a population of 10,352, but the increase has been exceedingly rapid since that period. Long. 85. 30. W. Lat. 38. 3. N.

The next town to Louisville, in point of commercial importance, is Maysville, situated on the Ohio, sixty-three miles north-east of Lexington. It is indebted for its importance chiefly to its being the principal place of importation for the north-eastern part of the state. Glass and some other articles are manufactured to a considerable extent. It possesses a fine harbour for steam-boats, a number of which have been built here, and is altogether a thriving, busy town. The population amounts to about 4000. Washington, three miles south of this place, is a considerable village, in the centre of a well-peopled country. It possesses the usual number of public buildings, such as court-house, jail, seminaries of learning, together with the customary stores and mechanics' shops, and also a branch of the Kentucky bank. Paris, the chief town of Bourbon

[1] *A Statistical View of the Commerce of the United States of America.* By Timothy Pitkin, 1835.

county, is central to a delightful and populous country, and is entirely an interior town, twenty miles east of Lexington. Some of the houses have a spacious appearance; and it contains some manufactories of cotton bagging and rope-walks, with a population of 1200. Georgetown, the county town of Scott county, is situated in a fine, rich tract of country, and contains a number of considerable manufacturing establishments, handsome private houses, and some public buildings. Newport, opposite to Cincinnati, is the county town for Campbell county, and is situated at the mouth of Licking River. It has a spacious arsenal, containing arms and munitions of war, and also some other public buildings. Bagging, cordage, and tobacco are manufactured here. Covington, situated below Newport, and on the opposite side of the Licking, is laid out with great regularity. It is intended that the streets shall be continuations of those of Cincinnati, and liberal donations have been made for the erection of public buildings. In this place are respectable manufacturing establishments, particularly of cotton. Russellville, the county town of Logan county, is an interior town, intermediate between Green and Cumberland Rivers, and thirty-five miles distant from each. It contains a seminary denominated a college, and a number of respectable public buildings. Salt lakes abound near the town, and many of the prairies in the vicinity are of great beauty. There are a great number of other towns and villages in this state, but it would be an unnecessary repetition to enumerate them particularly. They all possess public buildings and manufactures corresponding to their size or situation. We have mentioned one great public work belonging to Kentucky, the Louisville and Portland Canal. Another of a very important nature deserves mention, namely, a railroad extending from Lexington, through Frankfort, to Louisville, a distance of about ninety miles. The work was begun in 1832, and in January 1835 it was completed as far as Frankfort, a distance of twenty-eight miles. It is substantially built, and estimated to cost, when finished, 1,032,000 dollars.

The first permanent settlement of this state was begun on Kentucky River in 1775, by Colonel Daniel Boone. The county formed a part of the state of Virginia till 1790, and in 1792 was admitted into the union as an independent state. The constitution then adopted continued in force till 1799, when the one which now exists was formed.

The legislative power is vested in a senate and house of representatives, which together are styled the General Assembly of the Commonwealth of Kentucky. The representatives are elected annually, and are apportioned, every four years, among the different counties, according to the number of electors. Their present number is one hundred, which is the highest number that the constitution authorizes; fifty-eight being the lowest. The senators are elected for four years, one quarter of them being chosen annually. Their present number is thirty-eight; and they cannot exceed this number, nor fall short of twenty-four. The executive power is vested in a governor, who is elected for four years, and is ineligible for the succeeding seven years after the expiration of his term of office. At the election of governor, a lieutenant-governor is also chosen, who is speaker of the senate, and on whom the duties of the governor devolve in case of his absence or removal. The representatives and one quarter of the members of the senate are elected annually by the people, on the first Monday in August; the governor is elected by the people, every fourth year, at the same time, and he commences the execution of his office on the fourth Tuesday succeeding the day of the commencement of the election at which he is chosen. The polls are kept open three days, and the votes are given openly, or *viva voce*, and not by ballot. The general assembly meets (at Frankfort) annually, on the first Monday in November. The constitution grants the right of suffrage to every free male citizen (people of colour excepted) who has attained the age of twenty-one years, and has resided in the state two years, or in the county where he offers his vote one year, next preceding the election. The judiciary power is vested in a supreme court, styled the court of appeals, and in such inferior courts as the general assembly may from time to time erect and establish. The judges of the different courts, and justices of the peace, hold their offices during good behaviour. The state is divided into sixteen circuits or districts, to each of which there is attached a circuit judge.

The religious bodies of Kentucky stood in 1830 as follows: Baptists, twenty-five associations, 442 churches, 289 ministers, and 37,520 communicants; Methodists, seventy-seven preachers, and 23,935 members; Presbyterians, 103 churches, sixty-one ministers, six licentiates, and 7832 communicants; Roman Catholics, about thirty priests; Episcopalians, five ministers. What are called Cumberland Presbyterians are also numerous.

The principal literary institution is Transylvania university, at Lexington. It is under the patronage of the state, and in 1830 contained one hundred and forty-three graduates, sixty-two in the preparatory department, two hundred medical students, and nineteen law students. There are also other colleges in different parts of this state, supported by religious societies, viz. St Joseph's, at Bardstown, by the Catholics; Centre College, at Danville, by the Presbyterians; Augusta College, at Augusta, by the Methodists; Cumberland College, at Princetown, by the Cumberland Presbyterians; and Georgetown College, at Georgetown, by the Baptists. Many years since, the state appropriated 6000 acres of land for the purpose of endowing an academy in each county; but little public benefit has yet flowed from this source. Steps have been repeatedly taken for the purpose of introducing a system of common schools, but not with the effect which could have been desired. The general state of education in Kentucky may be gathered from a document furnished by the census of 1830. A committee had been appointed by the house of representatives to examine the subject, but the returns made to that body appear to be very inaccurate. If, however, we take those counties from which correct returns are supposed to have been made, it would appear that the number at school does not amount to more than one third of the aggregate number of children.

The first newspaper in Kentucky was printed at Lexington in 1786. The number printed in the state in 1810 was seventeen, and in 1834 twenty-five. There is a journal of medicine published, and some other periodicals have been attempted.

By a return, dated the 30th of August 1834, the bank in Kentucky stood thus: Capital, 1,079,435 dollars; notes issued, 450,000 dollars; specie and specie funds, 240,690 dollars; deposits, 250,000 dollars; discounts of notes, &c. 1,500,000. The postage received in Kentucky for the year ending 31st March 1832 amounted to 42,979·30 dollars. The population of this state by the census of 1830 was 688,844, of whom 165,350 were slaves. (R. R. R.)

KENWYN, a parish in the county of Cornwall, within the hundred of Powder, 257 miles from London. It joins the town of Truro, and forms a kind of suburb to it. The inhabitants amounted in 1801 to 4017, in 1811 to 5000, in 1821 to 6221, and in 1831 to 8492.

KENZINGEN, a city, the capital of the bailiwick of the same name, in the circle of Treisam, in the duchy of Baden. The bailiwick comprehends two towns, twenty villages and hamlets, peopled by 12,100 souls. The city stands on the river Elz, in a fine situation, containing 460 houses, and 2430 inhabitants. It is surrounded with walls, and is a place of some trade, especially in leather. Near to it is the well-frequented baths of Birnhalden.

KEOUNSAY, a town of the Burman empire, situated on the eastern bank of the Irrawaddy River; and, like all the other towns in this country, the houses are raised several feet above the ground, upon piles. Long. 96. 40. E. Lat. 17. 20. N.

KEPLER, John, one of the most eminent astronomers who have appeared in any age, was born at Wiel, on the 27th of December 1571. His father's name was Henry Kepler, an officer of distinction in the army of Wirtemberg, but reduced to poverty by numerous misfortunes. This exposed young Kepler to many difficulties and interruptions whilst acquiring the rudiments of his education; but such was his genius and his avidity for knowledge, that he surmounted every difficulty, and made astonishing proficiency. He studied at the university of Tubingen, where he obtained the degree of bachelor in the year 1588, and that of master of philosophy in 1591. In the year 1592 he applied himself to the study of divinity; and the sermons he produced afforded sufficient indication that he would have excelled as a preacher had he continued in the clerical profession. The mathematics, however, became his favourite study; and he soon acquired such distinguished reputation as a geometrician, that he was invited to Gratz in Styria in the year 1594, to fill the mathematical chair in the university of that city. After this period his chief attention was directed to the study of astronomy, and he made many interesting discoveries respecting the laws of the planetary motions.

Two years after his marriage with a lady descended from a noble family, persecution on account of his religion compelled him to quit Gratz, to which he was afterwards recalled by the states of Styria. The calamities of war, however, induced him to look out for a residence where he might enjoy greater safety and tranquillity. During this uncomfortable situation of affairs, the celebrated Tycho Brahe strongly urged him to settle in Bohemia as his assistant, where he himself had every necessary requisite furnished to him by the Emperor Rodolph for the prosecution of his astronomical studies. The numerous and urgent letters which Kepler received upon this subject, and the solemn assurances that he should be introduced to the emperor, at length induced him to leave the university, and settle in Bohemia with his family, in the year 1600. But on his way to that country he was seized with a quartan ague, which afflicted him for seven or eight months, and rendered him incapable of contributing that aid to Tycho which he would otherwise have done. He was likewise displeased with the conduct of this astronomer towards him, and thought that he behaved in an unfriendly manner, by neglecting to do a material service to his family when he had it in his power. Kepler further considered him as by far too reserved, in not communicating to him the whole of his discoveries and improvements. Tycho died in the year 1601, and the intercourse between these two eminent men being thus of short duration, precluded Kepler from being either serviceable to, or deriving much advantage from, the investigations and researches of the Danish astronomer. Kepler, however, was introduced to the Emperor by Tycho, in conformity to his promise, and appointed mathematician to his imperial majesty, with instructions to complete the Rodolphine Tables, which that great man had commenced. These were not published till the year 1627, owing to a variety of obstructions and difficulties which were thrown in his way. Two years after the publication of this work, he went, by permission of the emperor, to Ratisbon, to claim payment of the arrears of his pension, but he was there seized with a violent fever, supposed to have been brought upon him by too hard riding; and to this he fell a victim in the month of November 1630, in the fifty-ninth year of his age.

The learned world is indebted to this sagacious and able astronomer for the discovery of the true figure of the planetary orbits, and the proportions of the motions of the solar system. Like the disciples of Pythagoras and Plato, Kepler was seized with a peculiar passion for finding analogies and harmonies in nature; and although this led him to the adoption of strange and ridiculous conceits, we shall readily be disposed to overlook these, when we reflect that they were the means of leading him to the most important discoveries. He was for some time so charmed with the whimsical notions contained in his *Mysterium Cosmographicum*, published in 1596, that he declared he would not give up the honour of having invented what was contained in that book for the electorate of Saxony; so easy is it for the greatest of men to be deceived by a favourite hypothesis.

He was the first who discovered that astronomers had been mistaken in ascribing circular orbits and uniform motions to the planets, since each of them moves in an ellipsis having one of its foci in the sun; and, after a variety of fruitless efforts, he, on the 15th of May 1618, made his splendid discovery, that the squares of the periodic times of the planets are always in the same proportion as the cubes of their mean distances from the sun. As it was long a favourite opinion of Kepler's that there are only six primary planets, he seems to have been alarmed at the discovery made by Galileo of four new planets, or satellites of Jupiter, which gave a deathblow to the doctrines contained in his *Mysterium Cosmographicum.* The sagacity of this wonderful man, and his incessant application to the study of the planetary motions, pointed out to him some of the genuine principles from which these motions originate. He considered gravity as a power that is mutual between bodies; that the earth and moon tend towards each other, and would meet in a point so many times nearer to the earth than to the moon as the earth is greater than the moon, if their motions did not prevent it. His opinion of the tides was, that they arise from the gravitation of the waters towards the moon; but his notions of the laws of motion not being accurate, he could not turn his conceptions to the best advantage. The prediction he uttered at the end of his epitome of astronomy has been long since verified by the discoveries of Sir Isaac Newton, namely, that the determination of the true laws of gravity was reserved for the succeeding age, when the Author of nature would be pleased to reveal those mysteries.

To this concise account of the illustrious Kepler we shall now add a list of his principal publications. These are, 1. Mysterium Cosmographicum, already mentioned, 4to; 2. Paralipomena ad Vitellionem, quibus Astronomiæ Pars Optica traditur, 1604, 4to; 3. De Stella Nova in Pede Serpentarii, 1606, 4to; 4. Astronomia Nova, seu Physica Cælestis, tradita Commentariis de Motibus Stellæ Martis, ex Observationibus Tyconis Brahei, 1609, folio; 5. Dissertationes cum Nuncio Sidereo Galilei, 1610; 6. De Cometis libri tres, 1611, 4to; 7. Ephemerides Novæ, from 1617 to 1620; 8. Epitome Astronomiæ Copernicanæ, in two volumes 8vo, the first published in 1618, and the second in 1622; 9. Harmonices Mundi, lib. v. 1619, 4to; 10. Chilias Logarithmorum in totidem numeros rotundos, 1624, 4to; 11. Supplementum Chiliadis, &c. 1625, 4to; 12. Tabulæ Rodolphinæ, 1627, folio; 13. De Jesu Christi Servatoris anno natalitio. He was also the author of several pieces connected with chronology, the mensuration of solids, and trigonometry, and of a treatise on dioptrics, an excellent performance for the period in which he flourished. See the Dissertations on the History of Physical and Mathematical Science prefixed to this work.

KEPPEL Bay, on the eastern coast of New Holland, discovered and so named by Captain Cook, who sailed past it in 1770. It was visited by Captain Flinders, who discovered that it communicated with Port Curtis. Long. of the anchorage, 150. 58. E. Lat. 23. 29. S.

KERAH, or Haweeza, and by the Turks called Karasu, a considerable river of Persia, which takes its rise in the mountains of Ardelan, in Kurdistan, from the junction of numerous streams. It makes its way through the plain of Kermanshaw, greatly increased by the contribution of two considerable rivers, the Kazawur and the Gamasu; after which it flows with a furious course through Chusistan, receiving in its progress the accession of many streams. It flows onward to the ruins of Shus, and the city of Haweeza, and enters the Shut-el-Arab about twenty miles below Korna.

KERBELA, or Meshed Hossein, a large and populous town of Irak Arabi, situated at the extremity of a very noble canal drawn from the Euphrates. This was called by the ancient geographers Vologesia, and is mentioned as an inconsiderable place. But since the death of Hossein, the son of Ali by Fatima, the daughter of the prophet, who was slain near this place, and is interred at it, it has greatly increased, from the numerous resort of pilgrims of the sect of Ali, who flock to it from all quarters, especially from Persia, to pay devotions at the shrine. It has five gates, a well-supplied bazar, and seven caravanserais. But the chief and the only ornaments of the city are, the tomb of Hossein, which is adorned with a lofty cupola, gilded by Nadir Shah; and a noble mosque, consecrated to the memory of Abbas, the half-brother of the Imam. The town is subject to the Turks, but the majority of the inhabitants are Persians. The environs of the town and borders of the canal are shaded by extensive plantations of palm trees; and the walls, which are upwards of two miles in circumference, were repaired some years ago, to secure the riches of the city against the incursions of the Wahabees, by whom it was plundered when that sect was more powerful. The canal of Kerbela, or Nahr Sares, though it now bears the name of Hossein, is more ancient than the days of Alexander. This place is fifty miles south-south-west of Bagdad.

KERCOLANG, an island in the Eastern Seas, and the largest of the Salibabo islands, estimated at from eighty to a hundred miles in circumference, and inhabited chiefly by Mahommedans. It is situated between the 4th and 5th degrees of north latitude, and about 126. 30. of east longitude.

KERESOUN, a sea-port of Rumiyah, in Asiatic Turkey, situated in a gulf of the Black Sea bearing the same name. It consists of about 700 ruinous houses, of which 500 are inhabited by Turks, 150 by Greeks, and fifty by Armenians, the only industrious portion of the community. The town is built on an elevated rocky promontory which bounds the bay, and is supposed to be the ancient Cerasus. The inhabitants trade with the Crimea. It is seventy miles west-south-west of Trebisond.

KERGUELEN'S Land, or Island of Desolation, an island in the South Indian Ocean, discovered by Kerguelen, a Frenchman, and visited in the year 1779 by Captain Cook. It occupies one degree and a quarter of latitude, and about two of longitude. It is almost totally destitute of vegetation, owing to the coldness and moisture of the climate; and is represented as one of the bleakest and most desolate places of the earth, the haunt of sea-birds and amphibious animals. Long. 69. 30. E. Lat. 49. 20. S.

KERI-CETIB, are various readings in the Hebrew Bible, *keri* signifying that which is read, and *cetib* that which is written. For where any such various readings occur, the wrong reading is written in the text, and that is called the *cetib;* and the true reading is written in the margin, with ק under it, and called the *keri.* It is generally said by the Jewish writers that these corrections were introduced by Ezra; but it is more probable that they had their origin from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Masorites. Those keri-cetibs which are found in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption that the others are of later date. These words amount to about a thousand; and Dr Kennicott, in his *Dissertatio Generalis*, remarks that all of them excepting fourteen have been found in the text of different manuscripts.

KERINJA, a large walled town of Hindustan, in the province of Berar. It has a large reservoir of water. The latitude is not ascertained.

KERKOOK, a town of Asiatic Turkey, and the largest of Lower Kurdistan. It is the ancient Demetrias of Strabo, and the Corcura of Ptolemy. It is in the direct road from Bagdad to Mosul, fifty-nine furlongs from the former, and forty-one from the latter. The city is situated on a commanding eminence, nearly perpendicular on all sides, below which is an extensive suburb; and it still retains the appearance of a Roman fortress. A nearer examination of the town, however, disclosing the narrowness and filth of the streets, together with the meanness of the houses, leaves no doubt as to the character and habits of the people. The city is defended by a mud wall, and has two gates, seven mosques, fourteen coffee-houses, a museum, a caravanserai, an Armenian church, and twelve pieces of useless artillery on the bastions. In the suburbs are five mosques, nine small caravanserais, thirteen coffee-houses, three convents, and three catholic churches. The surrounding country is unequal in its surface, and on the north side is a low range of barren and rocky mountains. The population of Kerkook is estimated at 18,000, though Mr Kinneir does not think it can exceed 13,000. These consist of Turks, Armenians, Nestorians, and Kurds. Long. 43. 42. E. Lat. 35. 29. N.

KERMANSHAW, a handsome and flourishing town of Persia, in the western part of the province of Irak. It is situated on the south-western slope of a range of mountains, at the extremity of a large plain, through the centre of which runs the Kerah or Karasu. It has the appearance of a handsome city, exhibiting the glittering domes of mosques within, and the battlements and towers of lofty walls without. The present shah has made it the capital of the district, over which he has constituted his eldest son, Mahmoud Ali Mirza, the governor. This prince is daily adding to its importance, by the construction of modern defensive works, and the erection of various public edifices. The bazar was rebuilt on an extensive plan in 1818, when it was visited by Sir R. K. Porter; a magnificent palace was also finished at the same time. Kermanshaw is famous for a manufactory of fire-arms, and the villages in its vicinity for carpets of the most beautiful colours and fabric. Luxurious gardens surround the town, abounding in fruits of all kinds, but particularly in grapes of a delicious muscatel flavour. The population amounts to 15,000 families, amongst whom there are a few Christians and Jews. It is 140 miles north-east from Bagdad. Long. 46. 30. E. Lat. 34. 20. N.

KERMES, the name of an insect produced in the excrescences of a species of the oak.

Kermes Mineral, so called from its colour, which resembles that of vegetable kermes, is one of the antimonial preparations.

KERN, or Kerne, a term in the ancient Irish militia, signifying a *foot soldier*. Camden tells us that the armies of

Ireland consisted of cavalry, called *galloglasses;* and infantry, lightly armed, called *kernes*. The kernes were armed with swords and darts; and to the latter were fitted cords, by which they could recover them after they had been launched out.

KERREY, a large parish in the county of Montgomery, and hundred of that name, in North Wales, 179 miles from London. It is finely situated on a gentle eminence in a beautiful valley, and the country around it is highly fertile. A large proportion of the population is employed in making fine Welsh flannels. It has a fine old Gothic church, of most venerable appearance. The population amounted in 1801 to 1758, in 1811 to 1855, in 1821 to 2038, and in 1831 to 2199.

KERRY, a maritime county in the province of Munster, in Ireland, is bounded on the north by the estuary of the river Shannon, which separates it from the county of Clare; on the east by the counties of Limerick and Cork; on the south by the county of Cork and the Atlantic; and on the west by the same ocean. The tribe of the Juvernii inhabited this part of Ireland during the time when Ptolemy wrote. Previously to the English invasion, the O'Connors were in possession of its northern parts, the Moriartys of the middle, and the O'Sullivans and O'Donoghoes of the southern. The M'Carthys were also a powerful sept here; but their property afterwards fell into the hands of the Fitzgeralds, from whom was descended the Desmond family, the head of which exercised an authority nearly equal to that of sovereign in Kerry and the adjoining counties till the close of the reign of Elizabeth. The county was made shire-ground so early as 1210, by King John; but afterwards the southern part of it, together with a large portion of the county of Cork, as far as the mouth of the Blackwater, was formed into a palatinate in favour of the earl just named. After the attainder of the last Earl of Desmond, and the confiscation of his property, the county was portioned out amongst English adventurers, the principal of whom were the Dennys, the Brownes, and the Conways. It is at present divided into the eight baronies of Clanmaurice, Corkaguiney, Dunkerron, Glanerough, Iraghticonnor, Iveragh, Magonihy, and Trughenachmy. It extends over a surface of 1,148,720 acres, of which 581,189 acres are cultivable land, 552,862 acres are mountain and bog, and the remaining 14,699 acres are covered with water. The average length and breadth of Kerry is sixty miles from north to south, by fifty-four from east to west.

The county contains the two dioceses of Ardfert and Aghadoe, which have from time immemorial been united so intimately that the parishes belonging to each cannot be ascertained. In 1663 they were both allowed to be held in commendam by the Bishop of Limerick, and the union thus formed has not been since disturbed. This union of dioceses is the only one that has not been in some manner altered by the late arrangements for the reduction of the number of Irish bishoprics. The diocese of Ardfert includes the northern part of the county; the seat of the see is Ardfert, a small town, now little more than a village. The cathedral was burned in the wars of 1641. A small part of the building was afterwards fitted up for divine service, and has been since kept in decent repair. The seat of the diocese of Aghadoe, which comprehended the southern part of the county, is at a place of the same name, near Killarney, where the ruins of the cathedral are still to be seen. The number of parishes in the united dioceses is eighty-eight, five of which are in the county of Cork.

The land in the northern part of the county is low and level, although it rises to a considerable elevation at the north-western promontory of Kerry Head, which presents an elevated summit to the fury of the Atlantic. The middle part is an upland, gradually rising to the east and south; the southern is wholly mountain and glen, having in it some of the highest points in Ireland. The loftiest of these is Garran-Tual, 3410 feet above the sea, being the summit of the range called M'Gillycuddy's Reeks, which stretches across the barony of Dunkerron, sending out several branches in various directions. Of these, Mangerton, stretching towards the east, is the next in elevation, being 2550 feet high; more eastward of which are the Paps, rising to a height of 2280 feet; and between both these, Turk, Glena, and Tomies Mountains, all of elevations little inferior. To the west are the mountains of Drung and Cullee, each 2000 feet high, separating Dunkerron from Iveragh, in which latter barony or peninsula are the lofty summits of Knockalin, 2150 feet, Knockadubber, 2000, and Knockatubrid, 1556 feet high. More northerly are Brandon Hill, Slieve Mish, the Stacks, and the Glanruddery Mountains, all of inferior elevation to those already mentioned. These mountain ranges are intersected by deep and precipitous glens, possessing features of sublime and picturesque scenery. One, called the Gap of Dunlo, lying between Tomies and M'Gillycuddy's Reeks, is formed by mountains on each side, nearly perpendicular, and opens into a valley watered by a succession of mountain lakes, and terminated by a romantic waterfall. These valleys are the beds through which numerous rivers take their course. The most northern rivers are the Feale, Gale, and Brick, which, having formed a junction near Rattoochurch, discharge their united streams, under the name of the Cashen, into the estuary of the Shannon. The Mang passes by Castlemaine, and empties itself into Dingle Bay. The Flesk, after a winding course through Glanflesk, falls into the Lake of Killarney, from which it passes, under the name of the Laune or Lane, with a body of waters much augmented, into Dingle Bay. The Carra, rising in the mountains of Dunkerron, falls into the same bay. The Fahrta and the Inny rise in Drung Mountain, and flow westward, the former into Valentia Harbour, the latter into Ballinskelig's Bay. The Roughty empties itself into the head of the estuary called Kenmare River. The Blackwater forms part of the boundary between this county and Cork. Lakes are numerous, but few of large size. The principal is the Lake of Killarney, celebrated for its scenery. It is situated near the town of Killarney, at the northern side of the range of mountains of which the Reeks form the summit, and consists of three lakes, named the Lower, Turk, and Upper. The first and second are separated only by a narrow isthmus, on which the fine ruin of Mucruss Abbey stands. The third is situated three miles higher in the mountains, and is connected with the others by a river navigable by boats, and equally admired as the lakes themselves for the scenery of its banks. The lower lake is studded with several islands, of which the most remarkable, both for fertility and beauty, is Innisfallen, on which stand the ruins of an abbey of the same name. The island also gives name to one of the most ancient of the native chronicles, entitled the *Annals of Innisfallen.* On Ross Island are the ruins of Ross Castle, which made a gallant stand against the parliamentary forces in the wars of 1641. Another is named O'Donoghoe's Prison, from being supposed to have been used as a place of confinement by a chieftain of that name. The other more remarkable features of the Lower Lake are O'Sullivan's Cascade, and the Bay of Glena, where there is an extraordinary echo. Turk Lake has but one island, named the Devil's Island. The Upper Lake has several. The most remarkable are, Oak, Arbutus, Ronar's, and Eagle Islands. The Lower Lake is not more than fifty feet above the level of the sea. The other lakes in the county are Lough Carrane, near Ballinskelig's Bay, containing several islands; Loughs Derriana and Elaineane, in the mountains of Iveragh; and Lough Brien, Carra, and Gutane, in Dunkerron. The Devil's Punch-Bowl is a small but very deep lake, near the summit of Mangerton Mountain; its water is extremely cold. Lough Quintan, near Kilmacaloge Harbour, has some small floating islands in it.

The coast is indented by several large bays. That next the county of Cork is the estuary of the Kenmare River, which contains some good harbours, and has a number of small islands along its shores. The next is Ballinskelig's Bay, to the north of which are the Skelig Islands. On the largest of these there was a convent, which was afterwards transferred to the mainland. The gannet breeds here, and nowhere else on the coast. North of this bay is Valentia Island, separated from the mainland by a safe and capacious roadstead, which has been chosen as the termination of a proposed railway from Dublin across Ireland, for facilitating the communication with North America. Dingle Bay succeeds, containing within it Castlemaine and Dingle Harbours, and having the Blasquet Islands at its northern extremity. Dunmore Head, to the north-west of this bay, is the most western point of Ireland. Smerwick Bay, Brandon Bay, and Tralee Bay are adapted for smaller vessels only; between the two latter are the Magharees or Seven Hogs Islands. Ballyheige Bay is separated from the Shannon by the bold promontory of Kerry Head. Within the mouth of the Shannon are the harbours of Ballylongford and Tarbert, the latter protected by the island of the same name.

The climate is mild, but moist. Many plants, generally deemed suitable only for the genial atmosphere of more southern latitudes, grow here freely; and cattle remain frequently in the open air during the whole winter. The soil in the northern parts is retentive and coarse; the middle district is mostly of an alluvial character. The valley of the river Mang is entirely limestone. The uplands are chiefly argillaceous, but with limestone intermixed. The valleys in the mountainous region of the south are mostly covered with bog; and, though at present little better than wastes, they are capable, from their favourable exposure, of being cultivated to advantage. All the limestone in the county is secondary, with marine remains and calc spar. The north-western coast to Kerry Head is composed of beds of argillaceous sandstone, nearly horizontal, in the partings of which, the quartz crystals called Kerrystones are found. The midland district is mostly argillaceous, composed chiefly of slate clay and hard sandstone, covering beds of anthracolite and culm, which has not been raised for fuel, partly on account of the abundance of turf, partly from the offensive vapour of the coal when ignited. The component rock of the mountains which form the whole of the southern district is of the transition class, being a clay slate or ardesia. The slate is quarried for roofing, particularly at Valentia Island. It is light and durable, splits readily, bears piercing, and is harder and more siliceous than that of Bangor. In all the mountains the common gritstone contains large quantities of spar or crystal. Detached blocks of it are also found in the valleys, in some places in such quantity as seriously to impede cultivation. Iron ore is found in great plenty in the southern parts, and was largely manufactured at Killarney and Blackstones, until the works were stopped by the failure of timber for fuel. Copper was raised at Mucruss and Ardfert. The marble of Tralee is marked like that of Kilkenny, but with larger spots; other kinds of marble have been raised in various parts. Fine amethysts have been found near Kerry Head. Potters' and pipe clay, a substance like tripoli, brown ochre, and fuller's earth, are to be met with in various places. The whetstones found near the Devil's Punch-Bowl are much valued. Fossil shells, particularly of the cockle species, are frequent. Several mineral springs, some chalybeate, others sulphuro-chalybeate, have been discovered. Of the former, there is one near Killarney, another near Valentia Island, another at the mouth of the Inny, and several between Blackstones and Killorglin. Of the latter, the most celebrated are near Dingle, Castlemaine, and Tralee. A saline spring at Magherybeg, in Corkaguiney, rises a little below high-water mark, bursting out of a clear white sand.

The deep and extensive vales with which the mountainous district in the south is everywhere indented, are almost wholly occupied with bog, most of which, from its elevated position, and the declivities of the land, would admit of easy and profitable reclamation. The extent of bog throughout the county is estimated at 171,054 acres. One species of it, called by the people meagh-bone, or fat turf, is of a highly inflammable quality, and is therefore used more to give light than heat: a small piece applied to a lighted candle burns like a wax taper. The county was once covered with timber, much of which has been cut down for the supply of the iron-works; but there are still many fine tracts of wood; and, even where the land has been cleared, its re-growth is prevented solely by the cattle; for, wherever these are excluded, the trees shoot up from the old roots so vigorously as often to choke up the young plantations. Some of the great landed proprietors are very attentive to the rearing of timber trees.

The population of the county, according to the estimate of De Burgo, amounted to 56,628 in 1760; in 1792, Beaufort judged it to amount to 107,000. The first parliamentary census, taken in 1813, which, however, was very inaccurate, stated it at 178,622; that of 1821, the most correct of any, gives 216,185; that of 1831, 264,559. The census of 1834 being returned according to dioceses instead of counties, prevents the specification of the amount of the population at that period; but from that return it appears that the dioceses of Ardfert and Aghadoe, which are nearly commensurate with the county, contained 304,687 souls, of whom 7529 were Protestants of the established church, twenty-seven Protestant dissenters, and 297,131 Roman Catholics.

The returns of inquiries relative to education present the following results:—

	Boys.	Girls.	Sex unascertained.	Total.
1821,	10,106	3532	...	13,638
1824–26,	14,406	5609	76	20,091

Of the number specified in the second of these returns, 1026 were of the established church, 19,055 Roman Catholics, ten whose religious persuasion was unascertained. The total number of schools was 354, of which twenty-six, containing 1062 pupils, were supported by grants of public money; twenty-nine, containing 2766 pupils, by voluntary contributions of societies or individuals; the remaining 299, containing 16,263 pupils, were wholly supported by the fees of the parents and friends of the children who had recourse to them for instruction.

The relative numbers of Protestant and Roman Catholic children at the schools at the latter period were 1026 and 19,065; of which numbers, 16,263 paid for their education, 2766 were educated by voluntary subscriptions, and only 1062 derived the means of education from the grants of public money. This county was formerly famous for the knowledge of the Latin language acquired by the peasantry. The same holds good to the present day, though in an inferior degree. A taste for mathematics and arithmetic also prevails.

Previously to the union, the county returned eight members to parliament; two for the county, and two for each of the boroughs of Tralee, Dingle, and Ardfert. By the union the number was reduced to three, two for the county, and one for Tralee; and the reform act has made no change in this arrangement. The number of magistrates is 126, of whom fifteen are clergymen. The preservation of the peace is in the charge of the constabulary, consisting of six chief constables, thirty-two constables, and ninety-six sub-constables, making a total of 128 individuals.

The state of the constituency before and after the reform act is as follows:—

Date.	L.100.	L.50.	L.20.	L.10.	40s.	Total.
1st Jan. 1829,	88	460	269	...	3776	4593
1st Jan. 1830,	88	476	334	126	...	1024
1st May 1832,	...	277	231	653	...	1161

Tillage is in a more backward state than in any other part of Ireland, no regular system being practised. The usual crops are, potatoes, wheat, barley, oats, and flax; green crops are little known; rape is cultivated in a few places, for the seed. Dairies are numerous, particularly in the northern parts. The management of the cattle, and the manufacture of the butter, are judicious. An hundred thousand firkins of butter are annually sent to Cork for sale. Lime is much used for manure, as is also sea-sand, one species of which, called floating sand, from its great lightness, and found to consist wholly of fragments of shell, is much prized. In the mountainous parts the plough is little used, the tillage being chiefly executed by a long narrow-bladed spade, called a loy.

Kerry was remarkable for a small breed of black cattle and of horses. But both have degenerated so far as to be nearly extinct, in consequence of the introduction of English breeds. The native Kerry cow was prized for the beauty of its shape, the quantity of its milk, the facility with which it was fattened, and the excellence of its beef. The ponies were formerly found to be strong enough for agricultural purposes, but are now so degenerate as to be unfit for any thing but light saddle weights. Numbers of them, which never felt the restraint of a halter until transferred to the purchaser, are annually driven down from the mountains to the fairs held in the northern district. The Suffolk punch is now the favourite breed amongst the farmers. The sheep are of the mountain kind, in some parts of large size, and in general carrying good clothing wool. They have a strong resemblance to the Spanish merinos, from which they are supposed to be descended.

The chief manufacture is that of coarse linen, which is mostly confined to the barony of Corkaguiney. A quality of narrow cloth, of strong texture, called bandle linen, and also " box and trap," was in great demand for the army and the West India market. It owed its reputation to the careful method of preparing the yarn, but has latterly fallen into disrepute from mismanagement. The manufacture of wool is almost entirely confined to that employed in the domestic consumption, the rest being sent in the raw state to the Cork and Limerick markets. Flannels, however, are sold in some quantities in the markets of Tralee and Dingle. There are some distilleries, and several breweries, in the northern part of the county.

The fishery is chiefly carried on at Dingle and Valentia, from the former in row-boats, and from the latter in sailing vessels. A fishery is also carried on along the shores of the Kenmare River. All kinds of round fish are taken, as are also herrings. Pilchards were caught in large quantities, but they have latterly deserted the coast. Shell-fish of every kind are large and abundant. Salmon is caught in the rivers; but in some places the numbers are considerably diminished by the seals which frequent the rocky shores. These are sometimes shot while basking on the cliffs; at other times they are taken by moonlight in the caves, whither they retire to sleep. This latter mode of capture is attended with danger, as these animals fight desperately with their teeth, when driven to extremity, particularly when their cubs are in danger.

The state of the peasantry varies greatly in the different parts of the county. In the mountainous districts they are comfortable; and, though poorly housed, are well clothed, and enjoy an abundance of fuel. In some parts, the women wear a very becoming dress, consisting of a jacket of crimson or scarlet cloth, with long loose sleeves, made to fit very close round the neck and bosom, and fastened in front with a row of buttons. Marriages are contracted at a very early age; young men are often husbands at eighteen, and young women wives much sooner. In other districts the cattle and pigs are housed under the same roof with the family; the bedding is straw, hay, or dry rushes, with a blanket or coverlet, the floors of the cabins being mostly beneath the level of the soil, with no aperture but the door to let in the light or give vent to the smoke; the clothing is poor and scanty, two thirds of the population being without shoes or stockings; the diet, potatoes and sour-milk. The wages in spring and harvest are tenpence a-day, at other seasons there is no employment. Labourers have been known to offer their day's employment for twopence. In stature, the men are generally tall and well-proportioned, with swarthy complexions, dark eyes, and long black hair, exhibiting marked traces of their Spanish origin. They are a frank, honest race, of independent spirit, acute understanding, and of a friendly, hospitable disposition to strangers.

Remains of antiquity are numerous and singular. The most remarkable, as being unique, is a circular building on the mountains, on the north side of Kenmare River, called Staigue Fort. It surrounds an enclosure about eighty-eight feet in diameter. The wall is about ten feet high, built entirely of dry stone, without mortar, yet so smooth and compact on the outside as to have defied the ravages of time. On the inside it is built in the form of steps, so as to resemble a kind of amphitheatre. The entrance is by a small door, looking directly southwards. Nothing certain is known as to the origin or purpose of this singular erection. Among other conjectures, the most prevalent is, that it was devoted to religious exhibitions. A late ingenious inquirer supposes, from the position of the door, that it had been an observatory. The remains of three pillar towers still exist. One at Ardfert fell in 1771; of the second, at Aghadoe, about twenty feet remain standing; the third and most perfect is at Rattoo. The ruins of monastic institutions are numerous. The most celebrated is Mucruss Abbey, on the peninsula which divides the two lower lakes of Killarney: it is one of the great objects of interest to visitors of that place. In the cloisters, which are surrounded by a colonnade, in two different styles of Gothic architecture, is a venerable yew tree, that throws its branches over the whole interior. Ballinskelig Monastery stood originally on the largest of the islands of the same name, but was afterwards removed to a site on the adjoining mainland: it is in yearly danger of being washed away by the sea. O'Dorney Abbey, near the river Brick, is now a shapeless ruin. Rattoo is said to have been once the site of seven churches, and of a commandery of knights of St John, and also to have been a borough town. There was a dominican monastery at Tralee; but no traces of it now remain. The ruins of several stone cells, supposed to have been the residence of anchorites, still exist. There are many remains of ancient castles. Among the most remarkable are those of Carrigafoyle, Dunlo, Ballyheige, and Ardea, commanding an extensive view of Kenmare River, and once the residence of the O'Sullivans; Dunkerron, another seat of the same family; and Innisfallen, on the island of the same name. This last was taken by General Ludlow during the wars of 1641. A singular dyke, called Clee Ruagh, or the Red Ditch, proceeds from Kerry Head to the Cashin River, and thence to Limerick county, where its traces are no longer visible; it is supposed to have formed the boundary line between the principalities of Thomond and Desmond.

Tralee, the assize town, and the largest in the county, was once the chief residence of the Earls of Desmond, and the place where they held their palatine court. On the ruin of that family, it was made the county town, and obtained a charter, with the right of returning two members to parliament, which it retained till the union, when it was deprived of one of its members. Previously to that period, the constituency was limited to the burgesses, fifteen in number, who were nominated by the proprietor of the town, Sir Edward Denny. It now consists of 180 burgesses and householders. The town suffered greatly in the civil wars of 1641 and 1688. Its situation is healthy and picturesque, but not well adapted for trade, as large vessels can approach no nearer than the Samphire Islands, two miles distant. The court-house and jail form one side of a square in the centre of the town. The other public buildings are, the church, which is a fine modern structure, the Roman Catholic chapel, the Methodist and Independent meeting-houses, the county infirmary, the dispensary, and an infantry barrack for six hundred men. The remains of one of the four castles belonging to the Desmond family are still in existence. At some distance from the town is a celebrated sulphuro-chalybeate spa. The population in 1832 amounted to 9562. The next town in rank and population is Killarney, which owes its celebrity chiefly to the lakes in its neighbourhood; and there were, till lately, extensive iron mines wrought here. Mennius states, that there were four circles of mines round this town; tin, lead, copper, and iron. Tin has not been found here in modern times. Lord Kenmare's seat is contiguous to the town. Its population is 4710. Dingle, a place of some trade, and a fishing station, contains 4357 inhabitants. The population of the other towns which have more than one thousand inhabitants each is as follows: Listowel, 2289; Castleisland, once the county town, but now a declining village, 1569; Milltown, 1427; Ballylongford, a rising sea-port on the Shannon, with a very improveable harbour, 1300; Cahirsiveen, 1192; and Kenmare, at the head of the estuary of the same name, 1072.

KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KESCH, or KECH, a town, and capital of a district, in Great Buckharia. It was a favourite city of Timur, whose first appointment was as governor of this place. He here erected a splendid palace, on which the traveller Clavijo found workmen employed who had been labouring here for thirty years. It contained a university for the study of law and the sciences, and had also annexed to it gardens and meadows. It is thirty miles south of Samarcand.

KESITAH. This word is to be met with in Genesis and in Job, and is translated in the Septuagint and Vulgate, sheep or lambs. But the rabbin and modern interpreters are generally of opinion that *kesitah* signifies a piece of money. Bochart and Eugubinus conceive that the Septuagint meant *minæ*, and not lambs; in Greek, *hecatomnon*, ἑκατομνων, instead of ἑκατον ἀμνων. Now a mina was worth sixty Hebrew shekels, and consequently equal to L.6. 16s. 10½d. sterling. Pelletier is of opinion that *kesitah* was a Persian coin, stamped on one side with an archer (*kesitah*, or *keseth*, in Hebrew, signifying a bow), and on the other with a lamb; and that this was a gold coin, known in the East by the name of *daric*. Several learned men, without mentioning the value of the *kesitah*, say it was a silver coin, the impression on which was a sheep, for which reason the Septuagint and Vulgate translate it by this name. Calmet is of opinion that *kesitah* was a purse of gold or silver; and in the East they reckon at present by purses. The word *kista*, in Chaldee, signifies a measure, a vessel; and Eustathius says that kista is a Persian measure. Jonathan, and the Targum of Jerusalem, translate *kesitah* a pearl (Gen. xxxiii. 19; Job. xlii. 11), or L.9 English, supposing, as Dr Prideaux does, that a shekel is worth 3s. A daric is a piece of gold, which, according to Dr Prideaux, is worth 25s. of English money.

KESMARK, a city of the Austrian kingdom of Hungary, in the province of the Hither Theiss. It stands on the river Poprad, at the foot of the Carpathian Mountains. It contains 4650 inhabitants, of whom the majority adhere to the Lutheran church. It is adorned by an elegant palace, has one protestant and two catholic churches, and a Lutheran lyceum, with four professors. There are manufactures of linens and flannels, and considerable trade in wine. Long. 20. 22. E. Lat. 40. 73. N.

KESTREL, the English name for a hawk, called also the *stannel* and the *windhover*, and sometimes the *tinninculus* and *chencris*. It builds in hollow oaks, and feeds on partridges and other birds.

KESWICK, a market-town of the county of Cumberland, in the parish of Crossthwaite, in Allerdale ward. It stands in a deep valley, on the celebrated lake of the same name, or, as it is sometimes called, the Derwent Water. It consists of a single narrow, long street, with no attractive objects. It is protected from the cold winds of the north by the lofty mountain of Skiddaw, which rises to the height of nearly 3000 feet. In the summer it is visited by numerous parties, who make it their head-quarters whilst enjoying the scenery of the lakes and mountains in its vicinity. Keswick is a place of little trade, but there is a market held on Saturday. The inhabitants amounted in 1801 to 1350, in 1811 to 1683, in 1821 to 1901, and in 1831 to 2159.

KESZTHELY, a large and pleasantly-situated town of the Austrian kingdom of Hungary, in the circle of Szante, and province of the Farther Danube. It stands on the lake of Platte. There is in it a fine palace belonging to the family of the Counts Festitics. It has a large Franciscan convent, a hospital, two churches, and 4650 inhabitants, mostly Catholics. There is a valuable institution established by the count for increasing the knowledge and improving the practice of agriculture; and there are seminaries of other descriptions for the purposes of education. Long. 17. 9. 8. E. Lat. 46. 45. 45. N.

KETCH, a vessel equipped with two masts, namely, a main-mast and mizen-mast, and usually from 100 to 250 tons burden. They are principally used as yachts, or as bomb-vessels.

KETCH-HISSAR, a town of Asia Minor, in Caramania, beautifully situated amidst plantations of fruit-trees. It contains many ancient ruins, which extend over a space of seven or eight miles. There is particularly in this place a beautiful aqueduct of granite; and the massy foundations of several large edifices are to be seen in different parts of the town; and shafts, pillars, and pedestals lie buried under ground. It is supposed by Mr Kinneir that this place is the ancient Tyana, described by Strabo as one of the oldest cities in Cappadocia. The whole neighbourhood is impregnated with nitre, which supplies materials for a large manufactory of gunpowder. It is eighty-five miles south-west of Kaisarieh.

KETCHLUK, a town of Asia Minor, in Caramania, surrounded with gardens, and supposed to be the city described by Xenophon, in the plain of Cayster, where Cyrus first met the queen of Cilicia. It is ninety-eight miles north-west of Konieh.

KETEE, a town of Hindustan, in the province of Sinde. It is situated on an island in the river Indus, and is the principal town of a Mahommedan chief named Meer Thara.

KETOIE, one of the Kurile Islands, near the eastern coast of Asia, about twenty miles long and seven broad. It is covered with wood, which affords shelter to white foxes, seals, and sea-calves.

KETTERING, a town of the hundred of Orlingbury, in the county of Northampton, with a market on Saturday. It is seventy-five miles from London, and is a manufacturing place, where some worsted and woollen goods are made. It is not a well-built town. The sessions for the county are held in it. The inhabitants amounted in 1801 to 3011, in 1811 to 3242, in 1821 to 3668, and in 1831 to 4099.

KETTLE, in the art of war, a term which the Dutch apply to a battery of mortars, because it is sunk under ground.

Kettle-Drums are formed of two large basins of copper or brass, rounded at the bottom, and covered over with vellum or goat-skin, which is kept fast by a circle of iron, and by several holes fastened to the body of the drum, with a like number of screws to screw up and down, and a key for the purpose. The two basins are kept fast together by two straps of leather which go through two rings, and are fastened the one before and the other behind the pommel of the kettle-drum's saddle. They have each a banner of silk or damask, richly embroidered with the sovereign's arms, or with those of the colonel, and are fringed with silver or gold; and, to preserve them in bad weather, they have each a cover of leather. The drumsticks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum head and produce the sound. The kettle-drum with trumpets is the most martial sound of any. Each regiment of horse has a pair.

Kettle-Drummer, a man on horseback appointed to beat the kettle-drum, from which he takes his name. He marches always at the head of the squadron, and his post is on the right when the squadron is drawn up.

KEVELS, in *Ship-building*, a frame composed of two pieces of timber, whose lower ends rest in a sort of step or foot nailed to the ship's side, whence the upper ends branch outward into arms or horns, serving to belay the great ropes by which the bottoms of the main-sail and fore-sail are extended.

KEVERN, St, a parish of the hundred of Kerriar, in the county of Cornwall, 277 miles from London. The inhabitants amounted in 1801 to 2104, in 1811 to 2242, in 1821 to 2505, and in 1831 to 2437.

KEW, a village of the hundred of Kingston, in the county of Surrey, six and a half miles from London, on the right bank of the Thames, over which there is a handsome bridge. It is a pleasant village, with many highly respectable houses, but chiefly distinguished for the royal palace, the favourite residence of George III. The palace is of modern construction, built of brick faced with stone in the Gothic style. It is, however, inferior to the gardens, which are laid out with taste and judgment, and contain almost every curious vegetable production of various countries and climates. There are in these gardens a variety of temples connected with classical and historical subjects. One of the most remarkable is the Chinese pagoda, about 170 feet in height, said to be an exact copy of one in the celestial empire, from the top of which is a fine prospect over the surrounding country. The population amounted in 1801 to 424, in 1811 to 560, in 1821 to 683, and in 1831 to 837.

KEY, an instrument for the opening of locks. Molinus, in his treatise of keys, *De clavibus veterum*, printed at Upsal, derives the Latin name *clavis* from the Greek κλειω, *claudo*, I shut, or from the adverb *clam*, privately; and adds, that the use of keys is yet unknown in some parts of Sweden. The invention of keys is due to one Theodore of Samos, according to Pliny and Polydore Virgil; but this must be a mistake, as the use of keys was known before the siege of Troy, whilst mention is even made of them in the nineteenth chapter of Genesis. Molinus is of opinion that keys at first served only for untying certain knots wherewith they anciently secured their doors; but the Laconic keys, he maintains, were nearly akin in use to our own, consisting of three single teeth, and made in the figure of an E; a form of which there are still some to be seen in the cabinets of the curious. There was another key called βαλαναγρα, made in the manner of a male screw, which had its corresponding female in a bolt affixed to the door. *Key* has hence become a general name for several things serving to shut up or close others.

Key, or *Key-stone, of an Arch or Vault*, is the last stone placed on the top thereof, which, being wider and fuller at the top than bottom, wedges, as it were, and binds together all the rest. The key is different in the different orders. In the Tuscan and Doric it is only a plain stone projecting; in the Ionic it is cut and waved, somewhat after the manner of consoles; in the Corinthian and Composite it is a console enriched with sculpture, foliages, and other ornaments.

Key is also used for ecclesiastical jurisdiction, particularly for the power of excommunicating and absolving. The Romanists say the pope has the power of the keys, and can open and shut paradise as he pleases, grounding their opinion on that expression of Jesus Christ to St Peter, "I will give thee the keys of the kingdom of heaven." In St Gregory we read that it was the custom for the popes to send a golden key to princes, in which they enclosed a little of the filings of St Peter's chains, kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

Key, in *Music*, a certain fundamental note or tone, to which the whole piece, be it in cantata, sonata, or concerto, is accommodated, and with which it usually begins, but always ends.

Key, or *Quay*, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of lading and discharging merchant ships. It is accordingly furnished with posts and rings, by which the latter are secured; together with cranes, capstans, and other engines, to lift the goods into or out of the vessels which lie alongside. The verb *cojare*, in old writers, according to Scaliger, signifies to *keep in* or *restrain*; and hence came our term *key* or *quay*, the ground where they are made being bound in with planks and posts.

KEY'S Isles, three islands in the Eastern Seas, of considerable extent, and named Key Watela, Little and Great Key Islands, the first forty-five and the second sixty miles in circumference, and the third fifty miles in length and from five to twelve in breadth. They are situated about the 133d degree of east longitude and between the 5th and 6th degrees of north latitude.

KEYDEE, a town of Hindustan, in the province of Bahar, district of Nagpoor, 235 miles west by north from Calcutta. Long. 84. 49. E. Lat. 22. 46. N.

KEYNSHAM, a market-town in the hundred of the same name, in the county of Somerset, 114 miles from London. It is situated on the south bank of the river Avon, midway between Bath and Bristol. There is little trade, but a small market on Thursday. The inhabitants amounted in 1801 to 1591, in 1811 to 1748, in 1821 to 1761, and in 1831 to 2142.

KEYSLER, John George, a learned German antiquary, was born at Thournex in the year 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian and Christian Charles, the young counts of Giech-Buchau, with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation amongst the learned as he went along, by illustrating several monuments of antiquity, particularly some fragments of Celtic idols discovered in the cathedral of Paris. Having acquitted himself of this charge with great honour, he was, in 1716, appointed to superintend the education of two grandsons of Baron Bernstorff, first minister of state to his Britannic majesty as elector of Brunswick-Lunenburg. However, having in 1718 obtained leave to visit England, he was elected a fellow of the Royal Society, for a learned essay *de Dea Nehelennia, numine veterum Walachorum topico*. He also gave an explanation of the ancient monument on Salisbury Plain called Stonehenge, with a dissertation on the consecrated misletoe of the Druids. These detached essays, with others of the same kind, he published on his return to Hanover, under the title of *Antiquitates selectæ Septentrionales et Celticæ*. He afterwards made the grand tour with the young barons, and to this we owe the publication of his travels, which were translated into English, and published in 1756, in four vols. 4to. Mr Keysler, on his return, spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KHANAKEE, a handsome little town of Irak Arabi, on the high road from Bagdad to Hamadan. In the vicinity are some magnificent ruins, supposed to be those of the palace of Chosroes. It is ninety miles north-east of Bagdad.

KHANDESH, a province of Hindustan, in the Deccan, situated between the 21st and 23d degrees of north latitude. To the north it is bounded by the Nerbuddah, which separates it from Malwah; to the south by Aurungabad and Berar; on the east by Gundwana and Berar; and on the west by Gujerat. Its limits have never been accurately defined, though they may be estimated at 210 miles in length by eighty in average breadth. Khandesh was one of the small soubahs formed during the reign of Akbar, from conquests made south of the Nerbuddah. The modern subdivisions are, 1. Gaulna; 2. Khandesh proper; 3. Meiwar; 4. Bejagur; 5. Pattnemaur; 6. Hindia. This province is remarkably strong by nature, containing, within one day's march, nearly twenty fortresses, all in sight in different directions. The country is well watered. The chief rivers are, the Nerbuddah, Tuptee, and other tributary streams; the principal towns, Boorhanpoor, Asecrghur, Hindia, Nundoorbar, and Gaulna. The surface of the province is very irregular, though it is not mountainous. The ridge of the western Ghauts extends along the Tuptee, from which passes descend into the lower country. This river has deep and steep banks, and the adjacent country is curiously intersected with ravines from thirty to forty feet deep, and sometimes winding along for a distance of several miles. As the road frequently leads through these chasms, which are remarkably close and hot, it is not uncommon to see an army on its march through the country disappear in these deep valleys, and afterwards emerge half suffocated with heat and covered with dust. This country was once flourishing and populous; but at present, owing to the devastations of different plundering tribes, such as the Bheels, Pindarrics, and Arabs, joined to the oppressions of its Mahratta rulers, it is now desolate and overgrown with jungle, the towns are in ruins, the villages have been destroyed, and the soil, though fertile and well watered, lies neglected. The population is estimated at two millions, five sixths of whom are Hindus.

Khandesh was governed in the beginning of the fifteenth century by independent sovereigns, who, claiming descent from the Khalif Omar, resided at Aseerghur; but, towards the close of the century, it was subdued, and annexed to the Mogul empire. Since the decline of the Mahratta power, the greater part of the province of Khandesh was taken possession of by Arab colonists, whose soldier-like qualities gave them great influence in India. In 1818 the whole of Holkar's territories in India were ceded to the British, to whose dominion the Arab colonists evinced a decided aversion; and as it was resolved to re-transport them to their own country, they determined to resist to the last extremity. The last body of these brave adventurers surrendered in December 1818; but many of the Bheel chiefs, trusting to their mountainous and jungly recesses, continued refractory. They were dislodged from many of their retreats by the vigilance of British officers, who were for a long time engaged in this harassing warfare. The province was formerly famous for the manufacture of cotton cloths called baftahs.

KHARKOW, or CHARKOW, a city of the province Ukraine, in Russia, the capital of a circle of the same name. It is situated on the Donez, where that river receives the waters of the Lepanka and the Charkow. It contains 1552 houses, and 15,000 inhabitants. It is the seat of a university founded in 1813, with twenty-five professors, and 250 students. It enjoys some considerable trade, especially at four great fairs, to which the Asiatics and Turks equally resort. Long. 36. 50. 55. E. Lat. 49. 59. 20. N.

KHARSHOOT, a river of Asiatic Turkey, which, flowing through a narrow and beautiful valley, falls into the Black Sea near Tereboli.

KHASGUNGE, a town of Hindustan, in the province of Agra, sixty-four miles north-west from the town of Furruckabad. Long. 78. 36. E. Lat. 27. 52. N.

KHATANGA, a considerable river of Siberia, which has its rise in the government of Tomsk, and, after a course of 500 miles through a low and marshy territory, falls into the Northern Ocean, forming a gulf to which it gives name.

KHAUAR, or HAWARI, a town of Irak, in Persia, 200 miles north of Ispahan. It is situated on a mountain which separates the province of Irak from that of Mazanderan, and through which there is a narrow pass that takes its name from the town.

KHEMLASA, a large walled town of Hindustan, with a fort adjoining, in the province of Malwah, ninety-four miles south-west from Chatterpoor. Long. 78. 36. E. Lat. 24. 15. N.

KHEROO, a town of Thibet, situated on the north of the great Himalaya ridge of mountains, formerly a large, but now an inconsiderable place, having been laid waste, prior to 1790, by an incursion of the Tartars, who occupy the country to the north of Joongale. A considerable trade is carried on between Nepaul and this place.

KHILLIS, a town of Syria, situated at the foot of Mount Taurus, where there is a celebrated market for cotton. It is twenty-eight miles north-north-west of Aleppo.

KHOEE, a town of Azerbijan, in Persia, and capital of a rich and extensive district, situated on the borders of the lake Urumea. There is no town in Persia more beautiful and better built; the walls are in good repair; the streets regular, and shaded with avenues of trees; and the ceilings of many of the houses tastefully painted and embellished. These paintings are not modern; and as the immediate predecessors of Shah Ismael frequently held their court in this city, they were probably executed about that period. It is the emporium of a considerable trade carried on between Turkey and Persia. The population amounts to 25,000. The plain in which it is situated is famous for a battle fought in 1514, between Shah Ismael and Selim I., in which 30,000 Persians encountered 300,000 Turks.

KHOOSHGAL, a well-built small fort in the province of Bejapoor, and district of Bancapoor, strongly situated on a rising ground in the middle of an extensive plain. Long. 75. 13. E. Lat. 15. 29. N.

KHORASSAN is, strictly speaking, a province of Persia. In its more extended sense, however, it comprehends

Khorassan. an extensive tract of country, of which the boundaries have been differently defined, and indeed have greatly varied. In the great revolutions which have occurred in Asia, Khorassan has been the centre of a great empire, and the seat of mighty monarchs, and more frequently the dependency of a fallen state, and the scene of invasion, rebellion, and anarchy. It was a constant subject of dispute between the independent monarchs, whose territories lay respectively on the east and on the west; and it sometimes fell into the power of one, and sometimes of the other. In these circumstances, its political boundaries were continually varying, as the fortune of war inclined to one or other of the surrounding potentates. At one time they comprehended the whole country to the mouth of the Oxus, including the steppe of Khaurezm, Balkh, and all the intervening country to the east; on the south-east, not only the cities and dependencies of Herat, but those of Subzawur, Furrah, Geeresh, and even Candahar itself; on the south it was always bounded by Kerman and Seistan; on the west it included the district of Yezed, but its salt desert was bounded in that direction by the districts of Ispahan, Cashan, and Rhe, in the vicinity of Semnaun; and beyond the Elburz Mountains, the districts of Astrabad and of Goorgaun were also considered as the dependencies of this vast territory. If Khorassan be merely considered as a province of Persia, its extent would be very inconsiderable indeed. But if, with Fraser, we take into consideration the natural features of the country, the following boundaries may be assigned. According to this traveller, a line, skirting the districts of Ispahan and Cashan, and meeting the Elburz Mountains near Dehnimmuck, will divide Khorassan from Irak on the west. This line prolonged eastward to the desert on the eastern side of the Caspian Sea, in the steppe of Khaurezm, will form its northern boundary; and we cannot positively decide, nor is exactness in this matter of great importance, in what part of the great desert that occupies the whole space between the foot of the Elburz range and the Oxus, this boundary should be placed. In a political view, it does not extend at present beyond the base of the Elburz Mountains. To the eastward it may properly be allowed to include the districts of Serrukhs, Hazarah, and Balai Moorghaub; and a line running between these and the dependencies of Balkh, in east longitude 63°, in a direction nearly south, including the district of Herat, and touching Seistan, would be the boundary of Khorassan on the east; whilst on the south it is bounded by Kerman and Fars.

The surface of this extensive country is, like other parts of Persia, much diversified by plains and mountains; a very large proportion is quite unfit for the habitation of man, and consists of arid rocks, destitute of vegetation or fresh water, and deserts either of salt-land or sand, among which may be found a few spots, like islands in the sea. The following is a more particular description, chiefly compiled from Fraser's *Narrative of a Journey into Khorassan*.

The Elburz range of mountains, which is connected with the great chain of Caucasus, runs, in an easterly course, through the northern parts of Khorassan, sending forth various ramifications to the southward. From the base of these mountains a desert of barren sand, chiefly level, stretches northward to an immense extent, including the steppe of Khaurezm, and forming a part of that mighty plain which extends eastward as far as the Jaxartes and the Oxus. In this plain are found many fertile districts; but in that portion which is included in the limits now assigned to Khorassan, there is no permanent habitation, and the scanty sprinkling of population which it possesses consists of a few tribes of wandering Toorkomans. These mountains, though they present their loftiest face to the desert, still sweep down in a manner so gradual, as to enclose rich and well-watered valleys, which were formerly well peopled and cultivated, and once contained several towns, which are now in ruins, from the continued attacks of the Toorkoman plunderers. The only place of any consideration that remains is Serrukhs, 120 miles from Mushed, a very ancient town, the remains of which are now inhabited by Toorkomans and Usbecks. To the south, the Elburz Mountains send forth ramifications which penetrate the plain to the distance of from sixty to one hundred miles. Beyond this is the vast salt desert, which extends southward, with occasional fertile tracts, very nearly to the Persian Gulf. This desert varies very much in its nature in different parts. In some places the surface is dry, and even produces a few of those plants that thrive in a salt soil; in others it consists of a crackling crust of dry earth, covered with a saline efflorescence. There are extensive marshy tracts, in the lower parts of which water accumulates during the winter months, which is evaporated by the summer sun, leaving a quantity of salt in cakes, upon a bed of mud. In some places the soil is a hard-baked and perfectly barren clay; again, in certain districts, extensive plains of sand are found, which is occasionally heaped up in hillocks in the form of waves, and frequently so light as to be raised aloft by the winds in clouds, under which travellers are frequently buried, as in the Arabian deserts. The saline desert, however, according to Fraser, predominates in Khorassan. It is of a considerably higher level than the desert to the north of the Elburz Mountains; but still this traveller is of opinion that they are connected. The only fertile parts of Khorassan are where the country is penetrated by the Elburz Mountains; and in the north-east corner of Khorassan there is a long stripe of country, consisting of the lower parts of these mountains, from ten to twenty miles in breadth, which bear some inconsiderable traces of cultivation, and give shelter to a few miserable hamlets, but contain no village of any consequence. The valley of Mushed, amongst the Elburz Mountains, is of great length. It commences ten or twelve miles to the north-west of Sheerwan, extends, without interruption, for fifty miles beyond Mushed, and continues for the greater part of the way to Herat. It varies from twelve to thirty miles in breadth, and contains in its extent, besides the city of Mushed, the towns of Chinnaran, Radcan, Kabooshan or Cachoon, Sheerwan, and their dependencies, with a great extent of cultivated land. The road from Mushed to Herat must also pass through several well-peopled and well-cultivated districts. The extensive valley here spoken of contains a considerable portion of the district known by the appellation of Koordistan, being inhabited by Koordish colonies. The country which we have described above, under the title of Khorassan, may be estimated to extend between 500 and 600 miles east and west, and between 300 and 400 miles north and south.

Khozdar ‖ Khyrabad.

KHOZDAR, a town of Beloochistan, the residence of Meer Murad Ali, one of the principal Beloochee ameers of the Kumburanee tribe. It is situated in a small romantic valley of the same name, between two tremendous ridges of bare rocky mountains, tolerably well cultivated, and watered by a stream flowing through the centre. The town is walled, and has a good bazar. It is a Mahommedan town, though the Hindus are held in great esteem. The climate is severe; and at the approach of winter the richer classes retire to Cutch Gundava, to avoid the intense cold of the mountain air. It is distant from Kelat, the chief town of Beloochistan or Baloochistan, three days' journey. Its situation is not exactly ascertained, but is nearly in latitude 36. 30. N. and long. 67. E.

KHYRABAD, or KAIRABAD, a district of Hindustan, in the province of Oude, situated principally between the 27th and 28th degrees of north latitude, and bounded on the west by the Ganges, and on the east by the Goggra. The country is fertile and well watered, being intersected by the river Goomty; and its chief towns are Khyrabad, Shahabad, and Mahomdy. The capital, which is of the same name, is conveniently situated between two streams which fall into the river Goomty. Long. 80. 45. E. Lat. 27. 29. N.

KHYRPOOR, a town of Hindustan, in the province of Sinde, and the residence of the chiefs of the aristocracy who govern the place. It carries on a considerable trade, and is noted for the dyeing of cloths. Latitude not ascertained.

KHYVAH, an independent territory of Asia, which extends on or near the banks of the Oxus a distance of between 100 and 200 miles, and on all quarters is surrounded by the desert. The town of Khyvah, the capital, is about fifteen miles from the Oxus, or 240 miles from Mungushluc, a bay upon the banks of the Caspian Sea. This tract of country, however confined and unpromising, was at one time the seat of the Khaurezmian sovereigns, who maintained a very flourishing empire, well known in the annals of the East. This empire embraced the principal part of Western Asia, and the country around was populous and prosperous. But all is now changed. The country has been ruined by the invasions of different conquerors; and the city of Khaurezm or Ourgunge, like the most celebrated cities of the East, has become a ruin; and the seat of the petty power that now exists has been transferred to the mean and modern town of Khyvah. The modern city of Khyvah was totally ruined by Nadir Shah, at the time when he overran all Turkestan, on his return from India; its youth were enlisted in his armies, a great many were put to death, and numbers were transported to distant parts. The Usbeck Tartars at length obtained the ascendency in this country, and maintained on the throne a prince said to be of the race of Ghenghis. A chief from one of their tribes still rules in the country.

KIAHING FOU, a large and populous town of China, in the province of Tchekiang. It has extensive silk manufactures, there being scarcely a house in which silk-worms are not bred. It carries on a considerable trade, for the convenience of which canals are cut in every street. It is 130 miles south-east of Nanquin. Long. 120. 14. E. Lat. 32. N.

KIAKHTA, a town of Asiatic Russia, in the government of Irkoutsk, and district of Verschnei-Oudinsk. It is situated in a uniform and rather elevated plain, traversed by a river of the same name, and is surrounded by a lofty range of granitic and wooded mountains of a bleak aspect. It was visited in 1822 by Captain Cochrane, the celebrated pedestrian traveller, who mentions that it is a neat and regularly-built town, containing 450 houses, with 4000 inhabitants. Owing to the narrow and jealous policy of the Chinese, no stone buildings are by the treaty allowed to be erected, excepting only a church for public worship. Beyond the fortress, and immediately opposite Maimatchin, is the Chinese town Old Kiakhta, the residence only of the merchants; no officer or stranger being permitted to sleep in it, according to an article in the treaty. The old town contains, according to Cochrane, forty-five dwellings, many of which are very superior edifices, and have within them very rich stores. Though situated in a dreary and sterile oasis, Kiakhta, by means of its commerce, possesses many comforts. It is 330 miles south of Irkoutsk. On one of the mountains by which the place is surrounded are seen the boundaries of the Russian and Chinese empires, placed opposite each other; the Russian boundary being marked by a hillock of stones, with a cross at the top; whilst that of the Chinese is marked by a kind of pyramid. This place is remarkable as the centre of all the trade which is carried on between the Russian and Chinese empires; the Chinese, by the jealous policy of their rulers, being prohibited from trading with Russia through any other place. It was fixed upon by the treaty concluded between these powers in 1728, as the only medium of their mutual intercourse; and a great fair is accordingly held in December, when merchants flock thither from the most distant parts of the Russian empire. At this great commercial rendezvous are exchanged cloths; furs, namely, those of foxes, sables, river and sea otters, wild cats, beavers, and millions of squirrels, this latter fur, from its lightness, warmth, and durability, being a favourite with the Chinese; Russia and Morocco leather; for nankeens, silk stuffs, tea, rhubarb, &c. Woollen cloths and copper money are also exported to China, as well as many articles of curiosity and ingenuity, and some trinkets. The Russian and Chinese towns are quite separate from each other.

KIAMA, or Khiama, the capital of one of the four petty states or sultanries of Borgoo, a kingdom in the interior of Africa. It consists of a vast collection of thatched huts, built, as well as the town wall, of clay, and irregularly scattered over a considerable surface of ground. It is one of the towns through which the Houssa and Bornou caravan passes in its way to Gouja, upon the borders of Ashantee. It has also a direct trade with Dahomey, Youri, Nyfei, and Youriba. The inhabitants, for the most part Pagans, may amount to 30,000 in number. They are governed by a king or sultan, whose domination is despostic. Kiama is situated in long. 5. 22. 56. E. and lat. 9. 37. 33. N.

KIANGNAN, a province of China, which may be considered as the centre of the navigation, wealth, and commerce of this great empire. It is bounded on the east by the sea, on the north by Shantung, on the west by Honan, and on the south by Tchekiang and Quangsee. This extensive province is well watered, being traversed by the great rivers Hoangho and Yang-tse-kiang, previous to their junction with the sea, and by their numerous tributaries, which give it an easy communication with all the provinces and districts of the interior. It is also crossed by the great canal which leads to Pekin; and its waters are accordingly covered with a continuous line of barks, carrying to their various markets the different productions of the country. Nankeen is the capital, which surpasses Pekin in extent, and even in population. It contains many other cities, which, in point of size and wealth, might have been the capitals of empires. Industry and manufactures flourish to a great extent in this province; and the silks, japanned goods, ink, paper, and other articles, bear a higher price. There are manufactories of salt on the sea coast; and it contains also quarries of marble. The official estimate of the population given to Sir George Staunton was twenty-two millions, which is probably one of the boastful exaggerations of the Chinese.

KIANGSEE, a fine province of China, consisting chiefly of lofty and precipitous mountains, with fertile valleys interposed. It extends southwards from Kiangnan to Quangtong, and yields in abundance both rice and silk. Its mountains also contain various metals and minerals, and it has an uninterrupted navigation from north to south, forming part of the great line of water communication which reaches across the empire. A very extensive manufacture of porcelain is carried on in this province.

KIBBAN, a considerable town of Koordistan, situated at the foot of a high mountain, and surrounded by narrow passes and defiles. It is about one and a half mile from the Euphrates, and eighty miles west of Diarbekir.

KIDDER, Richard, an English bishop, was born, according to Wood, at Brighton, but according to others, in Sussex. In 1649, he was admitted sizar in Emmanuel College, Cambridge; in 1652, he took his bachelor's degree; in 1655, he was elected a fellow; and in 1656, he took his degree of master of arts. Having been presented by his college to the vicarage of Stanground, Huntingdonshire, he was ejected for non-conformity in 1662; but conforming soon afterwards, he was, in 1664, presented to the rectory of Raine, in Essex, where he continued until 1674, when he was made rector of St Martin's Outwith, London. In 1681, he was installed into a prebend of Norwich; in 1689, he was made Dean of Peterborough, on which occasion he took the degree of doctor in divinity; and, upon the deprivation of Ken, bishop of Bath and Wells, he was promoted to the vacant see. In 1693, he delivered the Boyle Lecture, and afterwards inserted in his Demonstration of the Messias, the discourses preached by him upon that occasion. He also wrote a Commentary on the Five Books of Moses, with a dissertation concerning the author or writer of the said books, and a general argument to each of them, which was published in 1694, in two vols. 8vo. To the first volume is prefixed a dissertation, in which he states and answers all the objections made against Moses being the author of the Pentateuch, and, in particular, replies to one drawn by Leclerc from Genesis (xxxvi. 31), which he treats with some severity. This led to a correspondence between him and Leclerc, which the latter printed in his *Bibliothèque Choisie*. Dr Kidder likewise took part in the Popish controversy, in the course of which he published, 1. A Second Dialogue between a Catholic Convert and a Protestant, showing why he cannot believe the doctrine of Transubstantiation, though he do firmly believe the doctrine of the Trinity; 2. An Examination of Bellarmine's thirtieth note of the Church on the Confession of Adversaries; 3. The Texts which Papists cite out of the Bible for their Doctrine of the Sacrifice of the Mass examined; 4. Reflections on a French Testament, printed at Bordeaux in 1686, pretended to be translated out of the Latin by the divines of Louvain. The death of this prelate was sudden and lamentable. In the night between the 26th and 27th of November 1703, he was killed in bed, with his lady, in his palace at Wells, by the fall of a stack of chimneys, occasioned by a violent storm which raged without. Dr Kidder was a clear and learned writer, and accounted one of the best divines of his time. (A.)

KIDDERMINSTER, a town of the hundred of Halfshire, in the county of Worcester, with a market, which is held on Thursday. It is 126 miles from London, on the river Stour. It has long been a place of great manufacturing industry. Formerly the chief goods made were of worsted, or of silk and worsted; then bombazeens, plushes, and poplins were introduced; but of late years the chief fabrics have been those of carpets, in which the Kidderminster manufactures have excelled all others. The streets are clean, well paved, and well built. There is a fine old Gothic church, a town-hall, many charitable institutions, and an endowed grammar-school. By the late law this town has acquired the right of electing one member to the House of Commons. The Staffordshire Canal joins the town, and affords assistance to its trade. The inhabitants amounted in 1801 to 6110, in 1811 to 8039, in 1821 to 10,709, and in 1831 to 14,981.

KIDDLE, or KIDEL (*Kidellus*), a dam or weir in a river, with a narrow cut in it, for the laying of pots or other engines to catch fish. The word is ancient, for in Magna Charta (cap. 24) we read *Omnes kidelli deponantur per Thamesiam et Medweyam, et per totam Angliam, nisi per costeram maris*; and, by King John's charter, power was granted to the city of London *de kidellis amovendis per Thamesiam et Medweyam*. A survey was ordered to be made of the weirs, mills, stanks, and kiddles, in the great rivers of England, by 1 Hen. IV. Fishermen corruptly call these dams *kettles*; and they are much used in Wales and on the sea-coasts of Kent.

KIDNAPPING, the forcible abduction or stealing away of man, woman, or child, from their own country, and sending them into another. This crime was capital by the Jewish law. "He that stealeth a man and selleth him, or if he be found in his hand, shall surely be put to death." (Exod. xxi. 16.) So likewise, in the civil law, the offence of spiriting away and stealing men and children, which was called *plagium*, and the offenders *plagiarii*, was punished with death.

KIDWELLEY, a market-town of South Wales, in the county of Carmarthen, 226 miles from London. It is built on both sides the river Gwendraeth, which is navigable from Carmarthen Bay. It was formerly surrounded with walls, and there are still the ruins of an ancient castle. The neighbourhood abounds with coals, the export of which forms the principal trade; and for promoting which, excellent mechanical contrivances have been adopted for the most economical mode of trans-shipping them from the barges to the sea-bound vessels. Near the town is an iron foundery, and also a manufactory of tin plates. The town forms part of the duchy of Lancaster, but is governed by its own mayor and aldermen. There is a tolerable market on Friday, and three annual fairs. The population amounted in 1801 to 1488, in 1811 to 1441, in 1821 to 1733, and in 1831 to 1631.

KIEL, a city of Denmark, in the province of Holstein, the capital of a bailiwick of the same name. It stands on a beautiful bay, resembling a lake, on the Baltic, and has an excellent harbour. It contains near 800 houses, with 8000 inhabitants. It is a well-built city, containing a university of high character, with about 250 students, an observatory, a museum of natural history, and a library of 60,000 volumes. It is a place of considerable trade, both in the productions of the vicinity and in foreign commodities, and in ship-building and the fisheries. Long. 10. 4. E. Lat. 54. 16. N.

KIELCE, a city of Poland, in the province of Cracow, the capital of a circle of the same name, and the seat of a bishop. It is, for a country like Poland, a well-built town, with the bishop's palace, four churches, a nunnery, 800 houses, and 5100 inhabitants. Long. 19. 55. E. Lat. 50. 52. N.

KIEW, a province or government of European Russia, in the division formerly called Little Russia. It is situated between 28. 30. and 32. 20. east longitude, and 48. 26. and 51. 34. north latitude. It extends over 15,466 square miles, comprehending sixty-eight cities and towns, and 1304 parishes, with several villages and hamlets in each. The inhabitants are 994,830. It is divided into twelve circles, receiving the name of the chief towns in it. It is generally a level district, with undulations of hills proceeding from the Carpathian Mountains, whose elevations in this province are inconsiderable. There are many pleasant spots, though none very striking; but the whole face of the country has a monotonous appearance. The soil is generally favourable to cultivation, and yields corn more than sufficient for consumption, so as to have 1,000,000 quarters annually for the supply of less productive districts. It yields abundant crops of hemp, flax, and tobacco. The cattle are numerous, and many are sold to Germany, Austria, and the internal provinces, to improve the breed. There are no mines. Much spirit is distilled from grain, which, with coarse cloth, soap, and leather, forms the chief branch of trade. The principal river, the Dnieper, receives the waters of the smaller rivers, and conveys them to the Black Sea. The capital, Kiew, is on the Dnieper, is the seat of an archbishop, and has a cathedral, twenty-five other churches, an ecclesiastical seminary or college, and other public institutions. It contains 3728 houses, in narrow and winding streets, and about 40,000 inhabitants. Long. 30. 22. 25. E. Lat. 50. 26. 19. N.

KILDA, St, or Kirta, a solitary isle in the Atlantic Ocean, belonging to the range of the Hebrides, but removed to a considerable distance from the main cluster. The nearest land to it is Harris, from which it is distant sixty miles in a west-south-west direction; and it is about one hundred and forty miles from the nearest point of the mainland of Scotland. It is about three miles long from east to west, and two miles from north to south, and consists of a lofty and uneven ridge, fenced round on all sides by one continued perpendicular mass of rock, of great height except at a part where is the bay or landing place, and even there the rocks have a considerable elevation. The surface of the island is rocky, rising into four eminences, the highest of which, called Conachan, is 1380 feet above the level of the sea. The general surface of the ground is a black loam, six or eight inches deep, and presents a nearly uniform, smooth, and green surface. Excepting some imperfect peat upon the highest point, the whole is covered by a thick turf of the finest and freshest verdure. The island contains three principal springs, one of which gives rise to a considerable stream. Excepting a small tract in the vicinity of the little village in which the inhabitants live, the whole island is in pasture. The soil would admit of cultivation to any extent, but the violence of the west winds limits the agriculture to the south-east declivity, where there is most shelter. This tract is held conjointly by all the village, on the system of run-rig, the ridges being interchanged after three years; and the work is performed by the spade and hand-plough. The produce consists chiefly of bear, which is considered as very fine. The oats are of very inferior quality, and are scantily cultivated; nor are potatoes raised to nearly the extent which is usual in Highland farming. A few horses are kept, together with some goats; but the pasture is chiefly occupied by sheep and black cattle. The breed of the former is Norwegian, and the wool which these animals produce is both thin and coarse. The cattle are small, and both the ewes and cows are milked. The cheese, which is made from a mixture of these milks, is much esteemed. This article, along with wool and feathers, constitutes the exports of the island. The St Kilda style of husbandry is somewhat primitive and peculiar to the island. The soil is rendered extremely fertile by the laborious industry of the inhabitants, who manure it with great care. The inhabitants are all congregated in a village about a quarter of a mile from the bay on the south-east. It consists of two rows of houses, with a pavement in the middle; and the habitations, like those of oriental countries, are nearly flat in the roof, in order to avoid injury from the storms which sweep over the island. The walls of the cottages are built of coarse free-stone, without lime or mortar, but consolidated by alternate layers of turf. All the houses are divided into two apartments, the interior one being for the family, and the other, nearest the door, being reserved for sheltering the cattle during winter. From their insulated situation, it is probable that the inhabitants of St Kilda have maintained the same manners, customs, and general style of life, for centuries. Previously to the reformation, there appears to have been three religious buildings on the island; but after that event took place, the inhabitants continued for ages unsolaced by the blessings of religion, being only connected with the parish of South Uist by name. These disadvantages are now obviated by the establishment of a missionary and a schoolmaster, under the patronage of the Society for the Propagation of Christian Knowledge. The people live much upon the wild sea-fowl with which the precipices abound; and at certain seasons the whole sea is covered, and the very atmosphere is darkened, with feathered animals. Upwards of 20,000 solan geese are annually consumed by the natives, besides an immense number of eggs. St Kilda contains about twenty families, who, remote from the bustle of the busy world, and the luxuries of polished society, pass an easy, and even a comfortable life.

KILDARE, an inland county in the province of Leinster, in Ireland, is bounded on the north by the county of Meath, on the east by those of Dublin and Wicklow, on the south by that of Carlow, and on the west by the King's and Queen's counties. In shape it somewhat resembles a truncated cone, having its base resting on Meath, and its vertex cut off by the intervention of Carlow. In its greatest length, measured from north to south, it extends forty miles, and twenty-six in its greatest breadth from east to west, comprehending an area of 392,435 acres, or 6132 square miles, of which 325,117 acres are cultivated ground, and 66,447 are unprofitable mountain or bog.

According to some writers, the Eblani were the inhabitants of this county in the time of Ptolemy; others, amongst whom is Whitaker, make it the habitation of the Coriundi. Afterwards it formed part of the territory of Cealan or Galen, which likewise extended over some parts of Wicklow and Carlow. Its present name is derived from Chille or Kill Dara, the forest or church of oaks, the country being formerly covered with trees. The principal family in this district, previously to the arrival of the English, was that of the O'Kellys, whose residence was at the Moat of Ardscull, near Athy. On the death of Dermod M'Murrough, the last king of Leinster, which occurred shortly after the settlement of the English in it, the county formed part of the palatinate of Leinster, granted by Henry II. to Strongbow. When this extensive inheritance was distributed into five portions, amongst the daughters of William, earl marshal, who derived from Strongbow, by intermarriage, through his only daughter, Kildare fell to the lot of Sybilla, the fourth daughter, who married William de Ferrers, earl of Derby, from whom it descended by marriage to the family of De Vesci, and thence by attainder to that of the Fitzgeralds or Geraldines. The principal families which held under Strongbow and his descendants were those of De Hereford, Fitzhenry, Phepoe, Pippard, d'Angulo or Nangle, and Bermingham. The Fitzgeralds ultimately became possessed of the greater part of it. It was one of the twelve counties into which King John, on his arrival as lord of Ireland, divided that part of the island which acknowledged the English jurisdiction, but was not finally separated from the adjoining county of Dublin, to which it had been attached as a liberty, until the close of the reign of Edward I., when it was empowered to have sheriffs and courts of its own. The county is now divided into the fourteen baronies of Carbery, Clane, Connell, Ikeathy and Oughterany, Kilcullen, Kilkea and Moone, North and South Naas, East and West Narragh and Rheban, East and West Ophaley, and North and South Salt. These baronies are subdivided into seventy-nine entire parishes, and seven parts of parishes, the remaining parts of which are in some of the adjoining counties.

According to the ecclesiastical arrangements, the county contains 113 parishes, fifty-six of which are in the diocese of Kildare, and fifty-seven in that of Dublin, besides a part of a parish which extends into the diocese of Meath. Kildare diocese extends also into the King's and Queen's counties. The bishopric was founded in the sixth century, by St Conleth, who was buried near the great altar of his own church. The chapter consists of a dean, precentor, chancellor, treasurer, four canons, and seven prebendaries. The bishop takes precedence of every other except Meath; all the rest rank according to the dates of their consecrations. Notwithstanding the elevated position he holds, his episcopal income, in consequence of the dilapidations of his predecessors, is extremely small, amounting only to L.520

a year; neither has he any episcopal residence, so that, in order to supply the deficiency of his revenue, he holds the deanry of Christ Church in commendam. The city of Kildare is a small, poor place, wholly unworthy of notice, except from the circumstance of being the seat of the bishopric, and from the cathedral, and some monastic remains still existing. This bishopric is one of those to be extinguished. After the demise of the present incumbent it is to merge into the archbishopric of Dublin.

By much the greater part of the county is a flat, interrupted only by a range of low hills in the centre, the most northern of which is the hill of Allen, and the southern those of Dunmurry; the land on the eastern boundary, toward Dublin and Wicklow counties, gradually rises as it approaches the adjoining mountain tracts. The general surface stands at an elevation of from 200 to 300 feet above the level of high water, giving birth to several rivers. The Boyne, with its tributary the Blackwater, rises in the bog of Allen in the northern part, as does the Lesser Barrow, which unites with the Greater Barrow near Rathangan. The Grees and Lane are small branches of this latter river, joining it near the southern extremity of the county. The Barrow forms the western boundary of the county, except in the neighbourhood of Athy, where the Mearing embraces some land to the west of this river, which should more properly form part of the Queen's county. The Liffey enters the county from the west near Ballymore-Eustace, and after sweeping through it, at first in a western and then in a northern direction by Kilkullen Bridge, Clane, and Celbridge, receiving in its course the Morrel and the Ryewater, it quits the county at Leixlip. Numerous lesser streams, rising in the more elevated tracts, fall into one or other of these rivers. A great part of the bog of Allen lies in the northern part of the county. This bog is not an interrupted morass, but is intersected in many places by elevated tracts of firm ground, the largest of which, lying in its southern part, has obtained the name of the Island of Allen, in consequence of its being surrounded by an unproductive and half fluid mass. To the south of the town of Kildare is a tract of undulating ground, covered with fine sward, of a vivid green, uninterrupted by any plantation. It is called the Curragh. It extends nearly five miles in a south-eastern direction, having an average breadth of a mile, and containing 8000 acres. It is used principally as a sheep walk, for which it is peculiarly adapted, from the quality of its herbage and the dry elastic nature of its soil. The pasturage is held by the farmers of the surrounding lands, who pay large rents for the exclusive privilege of grazing sheep on it, in numbers proportioned to the quantity of land without its limits. The most celebrated race-course in Ireland is on the Curragh. The softness and elasticity of the turf render it peculiarly suitable for this sport. Races are held here periodically, at which two plates of L.100 each are granted by the government, to encourage the breeding of running horses. The climate is moister than most other parts of the great limestone plain of Ireland. The soil of the county is generally a rich, heavy loam, on a bottom of limestone or limestone gravel, except in some insulated spots in the hilly districts. Copper ore is said to have been found in the central hills; but, either from deficiency of quality or quantity, or from a still more marked deficiency of fuel, none is now raised. The hill of Allen consists of a gritstone of which millstones are made.

The population was as follows, according to the authorities stated beneath, at the respective dates.

1760	De Burgo	51,726
1772	Beaufort	56,000
1812	Parliamentary return	85,133
1821	Ditto	99,065
1831	Ditto	108,401

The parliamentary return of 1834 being made according to dioceses, an accurate inference of its population at that period cannot be deduced from it. From these returns it appears that the population doubled itself in seventy years. When compared with the acreable contents of the county, it also exhibits an average of one inhabitant to every three acres, or of one family to every eighteen acres, and of 177 inhabitants to every square mile. The proportion of Protestants to Catholics may be estimated as about one to seven.

This population was represented in the Irish parliament by ten members, two for the county and two for each of the boroughs of Athy, Kildare, Naas, and Harristown. All these boroughs were deprived of the right of returning members by the act of union, and as the reform act has made no alteration in this point, the representation is at present confined to the two county members.

The state of the constituency before and since the alterations made in 1829, and subsequently, respecting the qualifications for exercising the elective franchise, is as follows:

Date.	L.50.	L.20.	L.10.	40s.	Total.
1st Jan. 1829,	376	80	—	496	952
1st Jan. 1830,	385	86	25	—	496
1st May 1832,	221	155	746	—	1122

The constabulary consists of five chief constables, forty-five constables, and 179 sub-constables, total 229, who are maintained at an expense of L.9644, being at an average of somewhat more than L.42 each.

The number of children receiving instruction in public schools, according to returns made under parliamentary authority in 1821 and 1824–26, are as follows:

	Boys.	Girls.	Sex not ascertained.	Total.
1821,	3398	2393	—	6391
1824–6,	5118	3578	161	8857

Of the number in the latter return, 1425 were of the established church, 7276 were Catholics, thirty-one dissenters, and 125 whose religious persuasion was unascertained. The number of schools was 214, of which twenty-five containing 1623 pupils, were maintained by grants of public money; twenty-nine, containing 1707 pupils, by voluntary contributions; the remaining 160 schools, containing 5527 pupils, were wholly supported by the fees paid by the parents or guardians of those receiving instruction. The diocesan school for the see of Kildare is held in Naas. The head master receives a salary of L.60 per annum from the bishop, in addition to the pupils' fees.

The lands are very unequally portioned out. There are a few large estates. That of the Duke of Leinster extends over nearly one third of the county. Many of the farmers hold large tracts; many others quantities scarcely sufficient for the sustenance of a family. The general average of farms is from 200 to ten acres. The former are well cultivated according to the most approved systems, though not with all the neatness and precision which mark the operations of the English agriculturist. The small farmers manage their land in a slovenly manner, and with a persevering attachment to the customs of their forefathers. Oxen are worked along with horses in the plough. Mules are to be often seen about the farm-yards. Tillage in partnership is very usual. Wheat is grown in large quantities, the strong loam being well adapted for it. The lands not subjected to the plough are very rich, fattening grounds; but when exhausted by injudicious courses of cropping, the pasture is poor and light. Dairies of any extent are seldom to be met with, except for the purpose of raising veal for the Dublin market. Large flocks of sheep are uncommon. The breeds both of black cattle and sheep are good; that of horses is injured by an excessive passion for breeding racers. The dwellings of the middling farmers generally consist of a long building of a single story, the lower part formed of stone and mortar, the upper of clay thatched with straw, and divided in the inside into a kitchen and two sleeping rooms, one at each end. In the front is a yard or bawn, enclosed at each side by the stables, barn, and cow-houses, and used as a repository for all the manure collected from the dwelling-house and offices, and for the feeding of the cattle. In the anxiety to collect manure, little attention is paid to neatness; the pile of it is generally heaped up in front, and a trough or cess for collecting the liquid is formed near the family door, to which the pigs have usually free access. The habitations of the labourers or cottiers are very wretched, particularly those living in or near the edges of the bogs. The cabin is sunk beneath the surface of the soil, in order to diminish the quantity of wall to be built. The roof, thatched with sods of turf pared off the surface of the bog, is but a few feet above the ground, and assimilates so closely with the appearance of the surrounding fields as to be nearly imperceptible at a short distance, except from the smoke rising out of its openings, or the ingress and egress of children and domestic animals through the hole in the side intended for a door. The food of the peasantry is potatoes, with some milk and butter occasionally. The use of flesh meat is little known, except on a few high holidays. The fuel is universally turf, which may be said to be the only thing the poor man here has in plenty. The clothes are made of home-manufactured frize, or cheap cottons. The English language is in general use.

Manufactures can scarcely be said to exist here. That of cotton was attempted at Prosperous, near Clane, but failed. An extensive woollen factory has been for several years at work near Celbridge, and still continues to produce large quantities of the coarser woollen cloths. Paper is also manufactured in some places, and tanning is carried on to a considerable extent. The county affords many fine sites for water-mills. The beautiful falls of the Liffey, at the salmon-leap near Leixlip, offer a perennial command of water adequate to move very extensive machinery. Many other falls are to be met with on the same river in its course through the county. The locks of the canals also could supply water for many lesser works. The Grand Canal enters the county from the Dublin side, at Hazelhatch, eight miles from the harbour at Portobello, and passes through it in a south-western direction to Sallins, where there is a short branch to the town of Naas. The main trunk proceeds in a western direction to Lowtown, at which place it divides into two branches, the one, proceeding westward to the Shannon, near Banagher, quits the county at Edenderry; the other, which takes a more southern direction, joins the Barrow at Monasterevan, the western bank of which river it follows as far as Athy, where it ceases, the river navigation from that point to the sea being deemed sufficient for the purposes of inland navigation. The summit-level, commencing at the distance of seven miles from Dublin, and extending four miles, is 264 feet above the level of the sea at high water. The Royal Canal, which skirts the northern boundary of Kildare, enters the county at Leixlip, and proceeding by Maynooth, Kilcock, and Cloncurry, quits it for the county of Meath at the Boyne. Both these carry to Dublin large quantities of turf, which is much used for fuel by the lower classes in the metropolis; also bricks, stone, flags, slate, grain of every description, and potatoes; and bring back chiefly manufactured goods, timber, and foreign groceries. The vicinity of the two canals during their transit through the county diminishes considerably the general extension of the benefits that ought to accrue both to the metropolis and to the line of country which they traverse: in one part of their course they approach within four miles of each other.

The remains of antiquity are numerous. There are five round or pillar towers. That at Kildare is said to be the most perfect in Ireland; it is 130 feet high. At Taghadoe there is another seventy-one feet high. The third, at Kilcullen, has only forty feet standing. The fourth, at Oughterard, has suffered still more severely from the ravages of time; its height is but twenty-five feet. The fifth, which stands at Castledermot, is used as a belfry, and by a casual spectator might be mistaken for the trunk of a lofty tree, in consequence of its being enveloped with a covering of ivy from its base to its summit. Several of the upright stones, supposed to be relics of the worship of Baal, are also to be seen. One at Punch's Town stands twenty feet above the ground; another, with a conical top, is at Harristown; two others, situated at Jigginstown, are known by the name of the long stones; another, called the Gobhlan, is near the hill of Carmen or Mullamast, where is also to be seen a large rath, situated on the summit of a hill of some elevation, near which are sixteen smaller raths or hillocks. These are said to have been the seats of the elders when the assembly of the states of Southern Leinster, under the name of Naasteighan, was held on this eminence. At a later period it became more memorable from a tragedy acted upon it by some of the English settlers, who, having invited the neighbouring Irish chieftains to a conference there, for the amicable settlement of their disputes as to territorial boundaries, fell upon them unexpectedly, and slaughtered them to a man. The pit into which the heads of the victims of this murderous act of treachery were flung is still shown; and the place thence acquired its name of Mullamast, or the Hill of Decapitation. The other raths of most note are those of Ardscull, near Naas, where the English, under Hamo de Gras, were totally defeated by Edward Bruce in 1315; and that of Rheban, to the north of the same town. Others are still to be seen at Naas, Kilkea, Moone, Clane, and Lyons, and at Rathsallagh. The abbey of Kildare is one of the oldest in Ireland. It is said to have been founded by St Brigid, and was the place where the sacred fire was kept, which, after being extinguished by Henry de Loundres, archbishop of Dublin, in 1220, was again lighted and kept burning till the reformation. The ruins of the building in which it was kept are still shown. There were, besides this, an abbey of gray friars, and another of Carmelites or white friars, in the town. Castledermot had also three great monasteries. A parliament was held in one of them in the year 1499. Naas had an Augustinian and a Dominican abbey. The fine abbey of Monasterevan was converted into a mansion-house for the Moore family. Of that of St Woolstan's, near Celbridge, nothing now remains but two towers and gateways. The commandery of Tully, formerly belonging to the knights-templars, is now held in commendam with the bishopric of Kildare. At old Kilkullen, the site of the monastery is marked by some curious stone crosses. The principal castles are those of Kilkea, said to be built by De Lacy in 1180; those of Athy and Castledermot were built by the eighth Earl of Kildare. Timolin Castle was erected in the reign of King John, by the Lord of Norragh. Rheban, on the Barrow, gave the title of baron to the family of St Michael. The castles of Narraghmore and Harristown also gave baronial titles to their possessors. Amongst the modern seats, the most remarkable are Carton, belonging to the Duke of Leinster, a princely residence, near the town of Maynooth; Castletown, the seat of the Conolly family, and Killadoon, that of Lord Leitrim, in the same neighbourhood; Lyons, on the banks of the canal, the splendid mansion and demesne of Lord Cloncurry; Straffan, on the Liffey, between Celbridge and Clane, belonging to the Henry family; Belan, near Timolin, that of the Earl of Aldborough; and Palmerston, the Earl of Mayo's. At Jigginstown, near Naas, are still to be seen the walls of a large mansion commenced by the unfortunate Lord Strafford, whilst lord-lieutenant under Charles II., but never finished.

There is no large town in the county. The population of neither of the assize-towns amounts to 5000 souls. That of Athy, the larger, was, in 1831, 4494; and of Naas, 3808 souls. The former of these towns is situated on the banks of the Barrow, which is here crossed by a bridge, and owes much of its small population to its being the point of connection between the still-water navigation of the Grand Canal, which terminates here, and the river navigation of the Barrow. It was incorporated by James I. under the care of a sovereign, two bailiffs, and twelve burgesses. The assizes are held here once a year; and its old castle has been converted into a prison for the temporary detention of culprits. A free school, capable of receiving 270 children, is the only modern public building of any importance. Naas, situated on the Liffey, and communicating with the main trunk of the Grand Canal by a connecting branch, though less populous than Athy, has a better right to the name of the county town, as being the site of the principal prison; besides which, it can boast of a large Catholic chapel, a sessions-house, and a market-house. In other respects it presents nothing worthy of notice. Maynooth is remarkable for several castellated ruins, built at various times by members of the Fitzgerald family; and for being the site of the Roman Catholic College, founded for the education of the priesthood, and supported by an annual parliamentary grant. Its population is only 2052 souls. The other towns whose population exceeds one thousand souls are, Kildare, 1753; Kilcock, 1730; Celbridge, 1645; Monastcrevan, 1441; Castledermot, 1375; Clane, 1216; Rathangan, 1165; Leixlip, 1156; Prosperous, 1038.

KILDERKIN, a liquid measure, containing two firkins.

KILGERRAN, a town of Pembrokeshire, in South Wales, 231 miles from London, on the river Tivi. It is a corporate town, and had once a market, which has been discontinued. The inhabitants amounted in 1801 to 854, in 1811 to 769, in 1821 to 862, and in 1831 to 879.

KILKARY, a town of Hindustan, on the sea-coast of the Carnatic, and district of Minawas, 127 miles north-east from Cape Comorin. Long. 78. 53. E. Lat. 9. 15. N.

KILKENNY, an inland county, in the province of Leinster, in Ireland, is bounded on the north by the Queen's county, on the east by the counties of Carlow and Wexford, on the south by the county of Waterford, and on the west by that of Tipperary. It comprehends an area of 513,686 acres, of which 417,117 acres are cultivated land, and 96,569 acres are bog and mountain.

The parish of Durrow, forming an insulated portion surrounded by the Queen's county, was made part of the county of Kilkenny by an act of parliament, obtained through the influence of the Duke of Ormond. His object was to repress the outrages committed on his tenantry by the Fitzpatricks, who inhabited that district, and who, when tried in the Queen's county, which belonged to their own sept, were always acquitted, but when tried in Kilkenny, the duke's county, were sure to be convicted.

According to Ptolemy, the county was inhabited by the Brigantes and the Caucoi. It afterwards formed part of the kingdom of Ossory, which was sometimes tributary to Leinster, sometimes to Munster. After the arrival of the English, it formed one of the counties into which King John divided that portion of the island which recognised his supremacy. At the termination of the sixteenth century it was chiefly occupied by the Graces, the O'Brenans, the Butlers, the O'Sheas, the Rooths, the Harpurs, the Walshes of the mountains, the Shortals, and the Forstals. It is now divided into the nine baronies of Crannagh, Fassadining, Galmoy, Gowran, Ida, Iverk, Kells, Knocktopher, and Shillelogher; besides which, the county of the city of Kilkenny forms a separate jurisdiction. These baronies are subdivided into 126 parishes, and one part of a parish.

According to the ecclesiastical arrangements of the country, Kilkenny is chiefly comprehended within the diocese of Ossory, which extends over 120 of its parishes. Of the remainder, six are in the diocese of Leighlin, and part of one in that of Cashel. The see of Ossory was first planted at Seikyran, near Birr, about the year 402. Thence it was removed to Aghaboe, in the Queen's county, about 1052; and finally to Kilkenny, in the latter end of the reign of Henry II. Like Meath, it derives its name, not from the seat of the episcopal see, but from that of the district over which it extends. Besides nearly the whole part of the county of Kilkenny, the diocese also comprehends the entire barony of Upper Ossory, forming one third of the Queen's county, and a small part of the King's county. The dean of the cathedral exercises a kind of episcopal jurisdiction over the vicars-choral, similar to that of the dean of St Patrick's, Dublin; and the archdeacon formerly exercised an ordinary prescriptive jurisdiction over the whole diocese. The total number of its parishes is 136, of which 120 are in Kilkenny, fifteen in the Queen's, and one in the King's county. The annual value of the see was estimated at L.3859 by the parliamentary return made in 1833. In conformity with the new arrangements for the established church in Ireland, this diocese has been consolidated into that of Leighlin and Ferns.

The face of the country is mostly level, particularly in the central baronies; but hilly in the northern, and still more so in the south-eastern districts. An argillaceous soil is predominant. Very little ground is unfit for tillage, and that which is not productive of good grain throws up excellent herbage. The soil in the northern parts is chiefly a mossy turf a few inches deep, lying over a bed of stiff yellow or whitish clay. More southerly, the soil is light, covering an argillaceous schistus. To the west there is a hungry clayey loam, over a bed of limestone. In general, the nearer the limestone is to the surface, the poorer the soil. A light soil covers all the vicinity of the city of Kilkenny, exhibiting the appearance of slaty hills and gravelly bottoms. Proceeding southwards, the fertility increases. The angle of the river Suir, which forms the parish of Portnascully, is the richest land in the county. There is a great extent of mountainous land, much of it unimproved. The quantity of bog is inconsiderable, amounting altogether to 3500 acres; the largest tract is in the north-western extremity. Marl has been found between two strata of black turf mould; three strata of bog have also been discovered, separated by intervening beds of marl, oak, fir; sallow and birch have been found in the bogs. There are no loughs of any extent. In the parish of Cloghmanta there are some temporary lakes, produced by the water bursting up from the ground in November, and subsiding in spring. They are here named Loughans; in Connaught they are called Turloughs. The climate is less humid than that of Dublin or Wicklow.

The principal rivers are the Nore, the Barrow, and the Suir, all of which rise in the range of the Slieve Bloom Mountains, and, taking a southern direction, discharge themselves by a common mouth into the estuary at Waterford. The Nore passes through the middle of the county, and by the city of Kilkenny; it is navigable for boats as far as Thomastown, whence a canal has been for many years proposed to be carried to the last-named city; but it still remains uncut. The salmon-peal, a fish resembling the salmon, is caught in this river. The King's River joins the Nore at Jerpoint, and the Argula near Innistioge. The Barrow forms the eastern boundary of the county, from near New Bridge to its junction with the Suir, which latter river is its boundary to the south. The Barrow is navigable for boats along the whole extent of the borders of the county of Kilkenny, and still farther to Athy in Kildare county. The Suir is navigable for sloops to Carrick, and for barges to Clonmell in Tipperary.

The substrata of this county are granite, siliceous schistus, siliceous breccia, argillite, sandstone, and limestone. The granite hills form a very small part, being merely the extension of the Wicklow group. The rock is of various shades, but the best is of a light yellow tint, finely grained, and compact; black mica is found in it, together with specks of iron ore, and crystals of schorl. Siliceous breccia forms many of the lower hills. It consists principally of fine quartz sand, united by a siliceous cement, and enveloping rounded pebbles of quartz. This stone is constantly accompanied by a red argillite, which covers the sides of the hills, but scarcely ever the summits. The hills of breccia run southward from the Nore towards Waterford. The great hill of Drumdowney, near the Ross River, forms the extremity of the principal range. The stone is here of a fine grain, and is quarried for millstones, which are exported to Cork, Dublin, and other parts. In the western part of the county there is an extensive slate quarry, highly esteemed. The northern part of the county consists either of ferruginous argillite or of siliceous schistus. The former, from being always found above coal, is called coal-cover.

The collieries of Castlecomer are situated near the confluence of the small rivers Dinan, Dian, Bruckagh, and Cloghoge, which join the Nore. They were discovered by accident, in working for iron ore. The depth of the beds varies from two feet six inches to three feet one inch. The coal sill, or seat of the coal, which is sometimes raised with it, is a soft, black, brittle stone, full of shining impressions, exhibiting obscure traces of the roots of rushes. It stands fire in a peculiar manner; crucibles made of it resist the strongest heat, as, the more it is exposed to the fire, the harder it becomes. Fire-bricks are made from two parts of it and one part of clay. The excellent qualities of the Kilkenny coal for particular purposes occasion a great demand for it. It is heavy, burning with little flame, like charcoal in an ignited state, and throwing out a steady and violent heat. It dries malt well, and is excellent for the forge. When analyzed, it appears to approach nearly to pure carbon, the proportions being 97·3 of that element, and the remainder uninflammable ashes. It seems peculiarly calculated for cementing steel, and for potteries; but it has not been applied to either purpose, although materials for earthenware are to be found in the neighbourhood, and iron-mines of the best quality from the upper strata of entire hills. Yellow ochre is found in various places; also pipeclay of good quality. Manganese is seen on the banks of the Barrow, and near Freshford, and lead in small quantities between Innistioge and Ross; a mine of the latter at Floodhall was worked for some time with considerable profit. Iron has also been raised. Jasper, in pieces from ten to twelve inches long, and half as broad, have been found near the extremity of the granite district, between the Nore and Barrow. Limestone is the base of the central part of the county; but the quality varies much in different places, all the species of it containing impressions of shells or corallines. The most important limestone quarry is that which produces the Kilkenny marble; it lies about half a mile from the city. The stone, when polished, presents a black ground, varied with white marks, which appear more strongly when exposed to the air; but that approaching nearest to unmixed black is most esteemed. The analysis gave ninety-eight per cent. soluble in marine acid, and two per cent. of a black powder, which appeared to be carbon. The blocks, when raised, are finished at a marble-mill at some distance, remarkable for the ingenuity and simplicity of its mechanism.

At Ballyspellan, in Galmoy barony, is a very celebrated mineral spring. It is a chalybeate, and contains carbonic acid gas, which soon evaporates on exposure to the air. Its medicinal qualities have long been highly esteemed in the neighbouring country. Chalybeate springs, but not of much strength, exist in other places. This county is also celebrated for springs of very pure transparent water, most of them dedicated to some saint, whose patron-day is annually celebrated on their verge.

The population, taken at different periods, presents the following results:

1760	De Burgo	62,832
1792	Beaufort	100,000
1812	Parlimentary census	134,664
1821	Ditto	158,716
1831	Ditto	160,283

This table exhibits an increase of more than double in seventy years, and gives an average of one inhabitant to every three acres and a quarter, or of a family of six to every nineteen acres.

The parliamentary returns of the numbers of children receiving education in the public schools, in the years 1821, and 1824–26, give the following results:

	Boys.	Girls.	Sex not ascertained.	Total.
1821,	10,191	4,420	—	14,511
1824–26,	12,398	7,000	274	19,672

Out of this total of children enjoying the benefits of public instruction, according to the latter of these returns, upwards of 18,000 were Catholics; the Protestants amounting only to 1376, of which number but thirteen were dissenters. The number of schools maintained by public money was nineteen, in which 1515 pupils were instructed; of those maintained by private subscriptions, the number was the same, the pupils in them being 1281; all the other schools, 346 in number, in which 16,876 children were instructed, were maintained wholly by the fees of the pupils. From the same data, it may be inferred that the Catholics in the county of Kilkenny were to the Protestants at that time in the proportion nearly of twenty to one.

The county returned sixteen members to the Irish parliament, two for the county at large, two for the city of Kilkenny, two for the adjoining borough of Irishtown, and two each for the boroughs of Callan, Gowran, Innistioge, Knocktopher, and Thomastown. All these, except Kilkenny, were close boroughs, the elective franchise being vested in the burgesses, whose number seldom exceeded twenty, and who were elected through the influence of the proprietor of the land. The constituency of the county was as follows, before the Catholic relief act, after that act but previously to the reform act, and subsequently to the reform act:—

	L.50.	L.20.	L.10.	40s.	Total.
1829,	689	210	—	2353	3261
1830,	726	234	118	—	1024
1832,	222	106	918	—	1246

Very little ground throughout the county is unfit for tillage; the central parts are peculiarly adapted for wheat, to the growth of which the best ground, most of which has a limestone sub-soil, is devoted. The more mountainous tracts are exclusively appropriated to oats or pasture. Wheat is sown either on a fallow or after potatoes. The seed is always steeped for a day and night, in which process brine has been found most effectual in guarding against smut. Wheat here suffers also from what is called the red or yellow worm; but as this disease appears only in dry seasons, when the crop is better and more abundant, the evil is not much felt. Change of seed is much attended to. Barley is usually sown after wheat. Bear is little cultivated. The same may be said of rye; when raised, it is sown on burned land, and produces fine crops in the mountainous districts. All the manure that can be collected is applied to the potatoes. The street scrapings of Waterford bear a high price in the neighbouring baronies; sea-sand and composts of turf mould are also common. The use of green food for cattle is not so general as might be desired. Many of the cattle graze out during the winter; some are housed from Christmas to April. The only green food used in winter is furze-tops pounded, on which the cattle soon become sleek and fine skinned; for this purpose the large French furze is preferred. Little attention is paid to improve the pasturages. The mountain pastures are left in a state of nature, and the land produces little but heath. These heaths are very liable to take fire in dry summers, by which means the soil is eventually improved. Much land on the borders of the Nore and Suir is embanked and used for meadowing. The most considerable dairies are in the Walsh Mountains; a name supposed to be derived from the family to which a large tract of land formerly belonged. It is now mostly held by a single family, consisting of five branches, who possess upwards of two thousand acres amongst them. Their houses are small and contiguous. They intermarry amongst each other, which renders ecclesiastical dispensations frequently necessary. If a widow marry a stranger, she loses all except what she had brought with her to her first husband. The land is grazed in common, excepting three hundred acres, which are divided equally among the five families. They live principally on potatoes and griddle bread, with occasionally the offal of the pigs killed for sale. Their dairies have earthen floors, and are without ceiling, window, table, or shelf, but they are kept very neat.

Few horses are bred in the county, most are brought in from Munster to the fair of Callan, the only esteemed fair for this description of stock. The Suffolk sorrel breed is much in request. The common stock of black cattle is a cross of the Irish breed on the long-horned English. The Kerry cow is much in demand in dairies, for its low price and quantity of milk. The breed of sheep has improved very much, in consequence of the great pains taken to improve it. Merinos have been successfully introduced. Pigs are fattened to the weight of five hundred lbs. Goats are kept by small farmers and cottiers, but not in flocks. Rearing fowl is also an object with the small farmers. Large numbers of turkeys are sent to the autumn fair of Callan. Bees were more attended to formerly than now, yet the soil and climate are well suited to them. The dry hills, covered with heath and scented herbs, produce honey celebrated for its flavour, and for the depth of its combs.

Within the memory of some old persons, many parts of the county were covered with woods. Now there are but few, not covering more than two thousand acres. Attempts to raise plantations from the seed have not been successful, the seeds in this mild climate being liable to destruction from vermin. Orchards are much neglected. There are some ozieries on the banks of the Nore and Suir.

The woollen manufacture was introduced by the Earl of Ormond in the early part of the fourteenth century. He brought over workmen from Flanders, whose manufacture is still to be seen in the castle of Kilkenny. James duke of Ormond went to great expense to introduce the linen manufacture in the seventeenth century. Latterly an attempt was made to manufacture superfine broad cloths in the neighbourhood of Kilkenny, but it soon failed. Frizes and ratteens are still made; the women spin the wool. The manufacture of woollen cloth was succeeded by that of blankets, which is still carried on. The linen trade, after a continuance of fifty or sixty years, has so died away that not a vestige of it now remains, beyond the making of coarse linen and sacking for domestic use. There are salt-houses at Kilkenny, Newbridge, and Kilmurry. Paper is manufactured in several places. Bolting mills are numerous on the great rivers. The principal part of the grain raised in the county is sent to Dublin in the form of flour, malt, and meal, the manufacturing of which is another source of wealth.

The number of resident gentry is considerable. Amongst the mansions remarkable for splendour or for architectural beauty are, the castle of Kilkenny; Mount Juliet, the seat of the Earl of Carrick; Desart, the seat of the Earl of Desart; Kilfane, that of George Power, Esq.; Flood Hall, the residence of the head of the Flood family; and Besborough, the seat of the Earl of Besborough. Gentlemen's seats are numerous and elegant. The farm-houses are of stone, more generally cemented with clay than with mortar; the offices usually forming an irregular yard in front of the house. The people in the hilly parts, who hold land at will, live in scattered villages. The usual food of the peasantry is potatoes, to which milk and salt are sometimes added, and occasionally a herring. Turf is the general fuel, except in the neighbourhood of the collieries, where coal is burned, or else culm made up in balls with one third of clay. The clothing is frize, ratteen, and flannel. The women wear stuff petticoats and straw-hats manufactured at home. Spirituous liquors are seldom used, excepting at fairs, patrons, wakes, weddings, and christenings. One person at least from every family in the village is expected to attend at a wake, and the body is often conveyed many miles to the family burial-place. Irish is the language generally spoken, particularly in the hilly districts and in the western parts, where the priests frequently preach alternately in Irish and English.

Amongst the remains of antiquity may be noticed a circle covered with stones on the summit of Slieve Grian, "the Hill of the Sun," called also Tory Hill, on one of which is an inscription that has given rise to much controversy. There is another circular mound of stones on the hill of Cloghmanta, which signifies "the Rock of God." The most remarkable cromleach is at Kilmogue; its upper stone is forty-five feet in circumference. The country people call it Lachan Schal, or "the Great Altar Stone." Near the spa of Ballyspellin is a large stone, formerly supported by others; it is called Clogh-bannagh, or "the Stone of Blessing." Raths are numerous, particularly in Galmoy and near the Nore. At Earlsrath are the remains of a very large fort enclosed by a fosse. A moat near Rathbeath is pointed out as the place where Heremon, son of Milesius, built his palace and was buried. There are five pillar towers in the county. One is in Kilkenny, close to the cathedral; the others are at Tulloherin, Kilree, Fertagh, and Aghaviller, of which last the lower part only remains. All are in the vicinity of places of worship. Besides the remains of monasteries in the city of Kilkenny, there are vestiges of some others, once of great note, particularly one at Jerpoint, and another at Graige, both of the Cistercian order. The Dominicans had abbeys at Rosbercon and Thomastown, the Carmelites had one at Knocktopher; and there was a nunnery at Kilculliheen.

The number of castles is very great; most of them consist of a single square tower, which formed the keep. Graney or Grandison Castle, in Iverk, is among the most celebrated, as being the residence of Margaret Fitzgerald, the great Countess of Ormond, a woman of uncommon energies. King John built a castle at Tybrachny, where there are the remains of a Danish town.

KILKENNY city is situated on the river Nore, nearly in the centre of the county. Its name is generally derived from Kill-kenny, "the church or cell of St Canice," though by some it is traced from the words Coil-ken-ui, "the wooded hill near the river." It consists of two separate jurisdictions, the city of Kilkenny properly so called, and the borough of Irishtown, separated from each other by the small river Bregagh. An English settlement was formed here shortly after the landing of Strongbow; a castle was also erected, and the seat of the see of Ossory removed thither. William lord marshal, who married Strongbow's daughter, granted the town a charter of incorporation, which was confirmed by Gilbert earl of Clare. Elizabeth and James I. confirmed and enlarged its privileges. Parliaments were frequently held in it; amongst others, that which passed the celebrated statute of Kilkenny, which first notices the distinction of English by blood and English by birth. During the wars of 1641, it was the place where the assembly of the confederate Catholics held their sittings; the room where they met is still shown. Cromwell afterwards took the city on terms highly honourable to its defenders, and afterwards held his high court of justice in it. The buildings in the city and borough together occupy an area of about 380 acres. On the two most elevated points of the united towns are the castle and the cathedral, the most marked and ornamental structures of both. The city is irregular, but presents a cheerful and busy aspect: the houses, built chiefly of stone, are large and respectable. The Nore, here a river of some breadth, though not navigable, is crossed by two modern bridges. The castle comprehends the remains of the ancient fortress, combined with more modern buildings. It was purchased by James, third earl of Ormond, in 1391, and has ever since been the principal residence of the head of the Butler family. In 1399, he entertained Richard II. in it for fourteen days. King William dined there after the battle of the Boyne. The buildings now form the sides of a quadrangle. Its principal apartments were the presence chamber, formed of a suite of rooms opening into one another, in the farthest of which was an elevated seat for the lord of the mansion; and the picture gallery, chiefly furnished with family portraits. Several of the rooms were hung with tapestry; but the whole is now undergoing such alterations as will materially change the state of the interior without altering the feudal character of its exterior. The court-house is a large and elegant modern building, erected on the site of Grace's old castle, where the assizes used to be held. The tholsel, or city court, is also large, but unornamented; it contains several apartments, one of which is used as a library. The market, well stocked with provisions of every kind, is held in one of the divisions of its inferior area. There are barracks both for cavalry and infantry. The theatre is small, and was for some time kept open by an amateur company, composed of the neighbouring resident gentry. The county jail is at a short distance from the city. The environs of the town are very beautiful. The Duke's Walk is carried from it upwards of a mile along the banks of the Nore. The corporation consists of a mayor and aldermen, two sheriffs, a recorder, and other subordinate officers, who have the management of an income, arising from rents, of about L.1600 per annum. The cathedral of St Canice is an extensive pile, on a commanding elevation, in Irishtown. It is cruciform, surmounted by a small tower, and of greater dimensions than any similar building in Ireland, except the cathedral in Dublin. In the north transept is a chapel used as the parish church, where also is a stone seat called the chair of St Kevin. The choir and chancel are fitted up in a style of chaste simplicity. The aisle contains several sepulchral monuments; amongst them that of Pierce, eighth earl of Ormond, and Margaret Fitzgerald his wife. The burial-ground of the cathedral is entered by a flight of marble steps, and is planted with trees. The episcopal palace was originally erected in the time of Edward III., and was modernized and enlarged in 1735; it is now a commodious, though not a splendid residence. The church of St Mary is a spacious but plain structure. Several monastic institutions added much to the beauty and dignity of the city. The most ancient was the preceptory of St John, founded about 1211. The abbey church, remarkable for the singular structure of its windows, which procured it the name of "the Lanthorn of Kilkenny," has been converted into a parochial church under its old name. The extensive and noble ruins of the Dominican or Black Abbey, founded in 1225, have been repaired, and now form a Roman Catholic place of worship. The origin of the Franciscan Abbey is unknown. Its ruins are much admired. The grammar-school, generally called the college, is situated near the banks of the Nore. It was founded by Pierce earl of Ormond, and re-endowed by the Duke of Ormond in 1684. James II. erected it into a royal college, but on his abdication it reverted to its former state, and is now a respectable place of elementary instruction, capable of accommodating eighty resident pupils. In it Dean Swift, Congreve, Farquhar, and Bishop Berkeley, acquired the rudiments of classical literature. Kilkenny has also a seminary for the education of students intended for the Roman Catholic priesthood. A nunnery provides for the education of twelve boys and as many girls. The charter-school is adapted for seventy children. The infirmary, opened in 1767, is supported partly by grants of public money, partly by benefactions and subscriptions. The house of industry provides for the maintenance of the poor when out of employment; and an hospital for lunatics is attached to it. A neat range of buildings, called St James' Asylum, in the suburbs, was endowed in 1803, by Mr James Switzer, for the maintenance of twelve protestant and eight catholic widows. The population of the city and borough in 1821 amounted to 23,230 souls, and in 1831 to 23,741. The other towns the population of which exceeds one thousand souls each are, Callan, 6111; Thomastown, 2871; Castlecomer, 2436; Freshford, 2175; Graige, 2130; Ballyragget, 1629; Urlingford, 1336; Durrow, 1298; and Gowran, 1109.

KILLALA, a town of Ireland, in the county of Mayo, situated on a fine bay of the Atlantic, to which it gives name. There are here some small manufactures, but it is chiefly noted as being the place where the French landed in 1798, and of which they kept possession for about a month. It is 192 miles north-west from Dublin. Long. 9. 8. W. Lat. 54. 13. N.

KILLALOE, a town of Ireland, in the county of Clare, situated on the western bank of the Shannon, over which there is a bridge of nineteen arches. It is an old town, and possesses little or no trade; but there is a water communication with Dublin by means of a canal. Killaloe lies eleven miles north-north-east of Limerick.

KILLARNEY, a small town of Ireland, in the county of Kerry. It is a neat, thriving, and well-built place, much frequented on account of the lakes in its vicinity, for a description of which see the article KERRY.

KILLICRANKIE, a noted pass of Perthshire, Scotland, within about two miles of Blair-Athole. It is formed by lofty mountains impending over the river Garry, which rushes through in a deep channel beneath. In the last century this pass was one of some danger and difficulty, and a path hanging over a tremendous precipice threatened destruction at the least false step of the traveller. At present it is traversed by a beautiful road, forming part of the Highland line between Dunkeld and Inverness, and all danger or even difficulty has completely vanished. The finest portion of the pass is at the southern extremity, and

Killicrankie. nearly opposite to the house of Faskally, which is situated on a level paddock at the foot of the precipice, on the right bank of the Garry, which sweeps round the beautiful green spot on which it stands.

Near the northern extremity of this pass, in its open and unimproved state, was fought, in the year 1689, the battle of Killicrankie, between the adherents of James II. under Viscount Dundee, and those of William III. under General Mackay. Dundee's army was inferior in numbers to that of Mackay. When he came in sight of the latter, he found them formed in eight battalions ready for action. They consisted of 4500 foot, and two troops of horse. The Highlanders under Dundee amounted to little more than half that number. At five of the clock in the afternoon, a kind of slight skirmish took place between the right wing of the Highlanders and the left of the enemy. But neither army wishing to change their ground, the firing was discontinued for three hours. Dundee in the mean time passed from clan to clan, and animated them to action. About eight o'clock he gave the signal for battle. The Highlanders in deep columns rushed suddenly down the hill, reserving their fire until they were within a pike's length of the enemy; when, having discharged their muskets, they fell upon the red-coats sword in hand. Mackay's left wing, unable to sustain the shock, were driven by the Macleans with great slaughter from the field. But the Macdonalds, on the left of the Highlanders, were not equally successful. Colonel Hastings's regiment of foot stood their ground, and even forced the Macdonalds to recoil. Maclean, however, with a few of his tribe, and Sir Evan Cameron at the head of his clan, fell suddenly on the flank of this gallant regiment, and forced them to give way. The slaughter ended not with the battle. Two thousand men fell in the field and in the flight. The tents, baggage, artillery, and provisions of the enemy, and even King William's Dutch standard, borne by Mackay's regiment, fell into the hands of the conquerors. The victory was now complete. But the Highlanders lost their gallant leader, who, as he was raising his arm, and ordering the Camerons to advance, received a ball in his side. The wound proved mortal; and with Dundee perished all the hopes of King James.

The battle of Killicrankie, or of Renrorie as the Highlanders call it, was fought to the westward of the great pass, on a level space, in the form of a small amphitheatre, immediately below the house of Urrard, and bounded on the one side by the heights, on a terrace of which that house stands, and on the other by the river Garry, which at this place runs close by the modern road. In the middle of this little plain stands a rude block of stone, which is said to mark the spot where Viscount Dundee received the wound which put a period to his earthly career; but this is most probably a mistake; for, in the first place, if he had descended to the level ground, he could not have commanded a full view of the attack, whereas, by remaining at or near Urrard House, he must have perceived at a glance every movement that took place in the plain below; and, secondly, the tradition is uniform and uncontradicted, that he was mortally wounded by a ball which entered between the joinings of his armour, whilst his horse was stooping to drink at a well on the heights, and at the moment when he was ordering the Camerons to advance. Before the onset, the Highland army was drawn up on the face of the hill, a little above the house of Urrard; a position which gave them the entire command of the pass, and enabled them to attack to the greatest advantage. As Mackay was observing his adversaries, on the hill above, he turned round to young Locheil who stood next him, and pointing to the Camerons, "There," said he, "is your father and his wild savages; how would you like to be with him?" "It signifies little," replied the other, "what *I* would like; but I recommend it to you to be prepared, or perhaps my father and his wild savages may be nearer to you before night than *you* would like." And it happened as young Cameron had foreseen. Dundee delayed his attack until near sunset, "when," according to an eye-witness, "the Highlanders advanced on us like madmen, without shoes or stockings, covering themselves from our fire with their targets. At last they cast away their muskets, drew their broadswords, and advancing furiously upon us, broke us, and obliged us to retreat; some fled to the water, some another way."[1] In short, the charge was like a torrent, and the rout immediate and complete. Some regiments, indeed, withstood the first onset, and regaining their formation, made some show of resistance; but seeing themselves at length turned and abandoned, they soon joined in the flight. It has generally been believed that Dundee fell towards the close of the action; but a letter, which has been preserved, from James VII. to Stewart of Ballechin, who commanded the Athole men, proves the reverse. "If their courage and yours, and the rest of the commanders under you, were not steady," says James, "the loss you had in a general you loved and confided in, *at your entrance into action*, with so great inequality of numbers, were enough to baffle you." The consternation occasioned by the death of Dundee, however, prevented an immediate pursuit through the great pass. Had the discomfited troops been closely followed, and had a few Highlanders been placed at the southern entrance, not a man of them would have escaped. His uninterrupted retreat caused General Mackay to conclude that some misfortune had befallen Dundee. "Certainly," said he, "Dundee has been killed, or I should not thus be permitted to retreat unmolested." (Stewart's *Sketches of the Highlanders*, vol. i. pp. 66, 67.)

Killigrew. KILLIGREW, William, was the eldest son of Sir Robert Killigrew, and born at Hanworth, Middlesex, in the year 1605. At the age of seventeen, he became a gentleman commoner of St John's College, where he remained about three years; he then travelled into foreign parts, and, after his return, was made governor of Pendennis Castle and of Falmouth Haven in Cornwall. At a subsequent period, he attended Charles I. as gentleman-usher of the privy chamber; and, upon the breaking out of the civil war, he commanded one of the two troops of horse which were appointed to guard the royal person. He was in attendance upon the king when the court resided at Oxford; in 1642, he was created doctor of the civil law by the university of that place; and when the king's affairs were completely ruined, he suffered like the other cavaliers, and was obliged to compound with the republicans for his estate. But the Restoration made him some compensation for the losses he had sustained in the royal cause. He was appointed gentleman-usher of the privy chamber to Charles II.; and, upon the king's marriage,

[1] The author of the Memoirs of Dundee, speaking of this battle, says, "Then the Highlanders fired, threw down their fusils, rushed in with sword, target, and pistol upon the enemy, who did not maintain their ground two minutes after the Highlanders were amongst them; and I dare be bold to say, there were never such strokes given in Europe as were given that day by the Highlanders." What follows seems to partake a little of the marvellous. "Many of General Mackay's officers and soldiers were cut down through the skull and neck to the very breast; others had skulls cut off above their ears like night-caps; some soldiers had both their bodies and cross-belts cut through at one blow; pikes and small swords were cut like willows; and whoever doubts of this may consult the witnesses of the tragedy." The whole, indeed, seems to have been, in more senses than one, a very *cutting* affair.

he was created vice-chamberlain, an office which he held for twenty-two years. Killigrew died in 1693, four years after the Revolution. He was the author of four plays, printed at Oxford, 1666, in folio, and which have been commended by some eminent judges of dramatic merit, particularly by Waller. Another play, called the Imperial Tragedy, 1690, in folio, is also ascribed to him; and a little poem of his, set to music by Henry Lawes, is likewise extant. Wood informs us that, in his declining age, after he had retired from court, he wrote The Artless Midnight Thoughts of a Gentleman at Court, 1684, in 8vo, the second edition of which he dedicated to Charles II.; and another work, entitled Midnight and Daily Thoughts, in prose and verse, 1694, in 8vo. (A.)

KILLIGREW, *Thomas*, brother of the preceding, was born in 1611, and also distinguished for uncommon natural abilities. He was page of honour to Charles I., and afterwards groom of the bed-chamber to Charles II., with whom he had passed many years in exile. During his residence abroad, he visited France, Italy, and Spain, and was sent on a mission to Venice in August 1651. But the chief occupation of his leisure hours consisted in the cultivation of poetry and the composition of plays. Of the latter, Denham mentions only six; but it appears that he wrote nine during his travels, and two after his return, all of which were printed at London, 1664, in one vol. folio. Killigrew died in 1682, and was interred in Westminster Abbey. Possessing a vein of wild humour, to which he gave unlimited scope, he became a great favourite with Charles II., who, diverted by his sallies, paid more attention to Killigrew than to his ministers, and allowed the former access to the royal presence when that favour was denied to the latter. When he attempted to write, he was nothing. It was in conversation, and, above all, in light repartee, that he showed to advantage; being, in this respect, the reverse of Cowley, who made no figure in company, though he excelled in composition. Hence Denham, who knew them both, has thus characterised their respective excellencies and defects:

Had Cowley ne'er spoke, Killigrew ne'er writ,
Combin'd in one, they'd made a matchless wit. (A.)

KILLIGREW, *Anne*, "a grace for beauty, and a muse for wit," as Mr Wood says, was the daughter of Dr Henry Killigrew, brother of the two foregoing, and was born a little before the Restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the Duke of York and his duchess, to whom she was maid of honour, as well as several other portraits and history pieces; and crowned all her other accomplishments with unblemished virtue and exemplary piety. Mr Dryden seems quite lavish in her praise, though Wood assures us he has said no more of her than she was equal if not superior to. This amiable young woman died of the small-pox in 1685; and, the year after, her poems were published, in a thin quarto volume.

KILLOUGH, a considerable village of Ireland, in the county of Down, pleasantly situated on the sea-shore, with a good quay, and a fine, safe harbour. Long. 5. 38. W. Lat. 54. 15. N.

KILMALLOCK, a town of Ireland, in the county of Limerick, which some centuries ago was one of the best-built inland towns of Ireland, and made a conspicuous figure in the annals of Irish warfare. Its former splendour is indicated by ruins on a pretty large scale; but, of the monasteries, churches, and other buildings, only one street entire remains, inhabited by very poor people. It is situated twenty miles south from Limerick.

KILMARNOCK, a town in Ayrshire, which is said to derive its name from the circumstance of St Marnock having suffered martyrdom there, about 350 years after Christ. It is pleasantly situated upon an almost level plain, surrounded by very beautiful scenery. Of its early history little is known, and neither in a warlike nor a monastic point of view is it at all conspicuous. Two centuries ago Kilmarnock was a mere hamlet, dependent upon the baronial castle in its neighbourhood; and, forty years ago, it consisted chiefly of a number of narrow passages and lanes. Since that period, however, it has been greatly enlarged and improved, elegant and even spacious streets having supplanted the more confined avenues. It is now well lighted with gas, possesses a somewhat modern appearance, and promises to become one of the first manufacturing towns in Scotland.

Kilmarnock received its first charter as a burgh of barony in 1591, a second in 1672; and in 1700 its magistrates purchased from its feudal lord the whole *common good* and customs of the burgh. For many years the town was distinguished for the manufacture of those broad, flat bonnets, which were so long the characteristic of the lowland peasantry of Scotland. In the year 1790, the produce of its whole manufacture amounted only to L.86,000. However, since the above date, it has made rapid advances in many branches of manufactures, and is now the principal town in Ayrshire for population, wealth, and appearance. There are about 1200 weavers, and 200 printers engaged in the printing of worsted shawls; and from 1st June 1830 to 1st June 1831 there were manufactured 1,128,000 of these shawls, the value of which is about L.200,000. At present there are 1000 persons engaged in the production of Scottish, Venetian, and Brussels carpets: the annual amount of this important branch may be about L.100,000. The annual value of the boots and shoes manufactured is L.42,000, of the bonnets L.12,000. The number of sheep and lamb skins dressed annually exceeds 140,000. There are many other branches of manufactures carried on very extensively. It unites with Dumbarton, Rutherglen, Renfrew, and Port Glasgow in returning a member to parliament, Kilmarnock being the returning burgh. The town is distant from Edinburgh sixty-four miles, Glasgow twenty-one, Ayr twelve, and is connected with Troon Harbour by a railway, the distance being nine miles. It has a market every Tuesday and Friday, and these are busily attended. The various market-places are well arranged and commodious. The trade of the place is assisted by branches of the Commercial, Ayr, and Ayrshire banks. The town has several good libraries and reading-rooms, and publishes a newspaper weekly. There is also an academy, in which are taught most of the useful and elegant branches of education. This place has likewise the advantage of an excellent observatory, furnished with good telescopes. There is a philosophical institution, and many societies of a benevolent and friendly nature. There are three established churches, six dissenters' meeting-houses, and a body of about 600 Catholics who assemble in a large hall.

Almost the only antiquity here is a monument erected to the memory of Lord Soulis, commemorating the assassination of that nobleman by one of the Boyd family. It has been lately rebuilt, and bears the inscription, "To the memory of Lord Soulis, 1444. Rebuilt by subscription, 1825. The days of old to mind I call." Within a mile north of the town stands the ruins of the Dean Castle, the habitation of the Earls of Kilmarnock, which was burned by accident in 1735. The population amounts to 18,000, having increased 10,000 during the last thirty years.

KILN, a stove used in the manufacture of various articles; or a fabric formed for admitting heat, in order to dry or burn materials placed in it to undergo such operations.

KILSYTH, a village in the southern part of Scotland. It is situated on the public road, twelve and a half miles from Glasgow, eleven and a half from Falkirk, and sixteen from Stirling. It is a straggling, irregularly built, but populous place, containing upwards of 2000 inhabitants, who are chiefly engaged in weaving for the Glasgow manufacturers. Kilsyth is a burgh of barony, with the privilege of holding five annual fairs. Besides the parish church, there is a relief meeting-house. Kilsyth is commemorated in Scottish history by having given its name to the victory which the Marquis of Montrose gained over General Baillie in the year 1645.

KILWINNING, an ancient, and now a considerable and thriving town of Scotland, in the county of Ayr. It is situated on a rising ground about two miles from the sea, three miles north-north-west of Irvine, and three north-east of Saltcoats. Kilwinning consists chiefly of one main street, with several small lanes or alleys, together with a few rows of modern houses. It depends principally on the weaving and manufacture of gauzes, muslins, and the like, for the Glasgow and Paisley markets. The parish church stands amongst the few remaining fragments of the once splendid abbey from which the town is supposed to have taken its origin. There are, besides, two dissenting meeting-houses. The population may amount to about 1500.

KIMBOLTON, a market-town of the county of Huntingdon, in the hundred of Leightonstone, 65 miles from London. It stands on a rich and fertile plain, is tolerably well built, and has a small market on Friday. It belongs chiefly to the Duke of Manchester, whose magnificent seat near it has long been celebrated, and, by its architecture, its decorations, and its paintings, is an object of great attention. It was the residence of Catherine of Aragon, after her divorce from Henry VIII. The population amounted in 1801 to 1226, in 1811 to 1400, in 1821 to 1562, and in 1831 to 1584.

KIMCHI, David, a Jewish rabbi, famous as a commentator on the Old Testament, who lived at the close of the twelfth and beginning of the thirteenth century. He was a Spaniard by birth, son of Rabbi Joseph Kimchi, and brother of Rabbi Moses Kimchi, both men of eminent learning amongst the Jews; but he excelled them both, being the best Hebrew grammarian the Jews ever could boast of. He wrote a Grammar and Dictionary of the Hebrew language, from the former of which Buxtorf compiled his *Thesaurus Linguæ Hebreæ*, and from the latter his *Lexicon Linguæ Hebreæ*. His writings have been held in such estimation amongst the Jews, that no one can arrive at any reputation in letters and theology without studying them.

KIMEDY, a town of Hindustan, in the Northern Circars, 83 miles south-west from Ganjam. Long. 84. 11. E. Lat. 18. 48. N.

KINATOOR, a small town of Hindustan, in the Carnatic, in which is a Hindu temple, 222 feet in height. Long. 79. 19. E. Lat. 18. 48. N.

KINCARDINESHIRE, or the Mearns, a county in Scotland, situated between 56. 43. and 57. 5. north latitude, and between 1. 47. and 2. 30. west longitude from Greenwich. It is bounded on the east by the German Ocean; on the north by Aberdeenshire, from which it is divided along the greater part of the boundary by the river Dee; and on the west and south by Forfarshire, from which it is divided by the river North Esk. The boundary along the shore of the German Ocean extends to thirty-two miles, being the greatest length of the county; and the greatest breadth from east to west is twenty-four miles; the superficial contents being 360 square miles, or about 243,444 English acres.

The cultivated parts of the county form three principal divisions; the Howe of the Mearns, the Coast-side, and Dee-side. The Howe of the Mearns, a continuation of the great valley of Strathmore, is divided from the Dee-side district by the Grampian Mountains, which stretch, from west to east, through the whole breadth of the county, gradually declining in elevation, until they disappear in the level ground near the sea, between Stonehaven and Aberdeen. The greater part of this district is in a state of high cultivation, and the face of the country is diversified and ornamented by thriving plantations. The ground in many places is composed of a bright-red clay, which gives the surface, when newly ploughed, a very peculiar appearance. The great road from Perth to Aberdeen through Strathmore traverses this district. The Coast-side district, from the river North Esk to Stonehaven, contains, with some intermixture of inferior ground, the most productive land in the county. The road from Montrose to Aberdeen runs through this division. Notwithstanding the vicinity of the ocean, some thriving plantations are to be seen; and, almost close to the shore, there are trees of considerable magnitude, especially at Brotherton, where a finely-terraced old garden, although within reach of the sea spray, is remarked as being one of the best and most productive in this part of the country. From Bervie to Stonehaven, a distance of ten miles, the shore is high and bold, presenting to the ocean, along the whole line, a perpendicular face of rock, from 100 to 250 feet in height. The most conspicuous of this range of rocks is Fowlsheugh, well known as the rendezvous, during summer, of innumerable flocks of sea-fowl of various kinds. In the face of the rock are various caverns, and natural arches and galleries, of great extent and magnificence. From Stonehaven northward to the river Dee the shore is also bold and rocky; but the face of the country is generally of a very inferior character to that of the same district south of Stonehaven, just described. The appearance of a great part of this tract is as uninviting as can well be imagined. In the neighbourhood of Stonehaven, however, and in some other places, part of the ground is in a state of high productiveness; and, even in the most barren and forbidding parts, great improvements have recently been made, and the progress of cultivation is such as to promise at no distant period a total change on the face of this part of the country. The Dee-side district, forming the third division of the cultivated part of the county, is situated on both sides of the Dee, and extends along the south bank of that river, from the sea westward, for about thirteen miles, and afterwards along both banks for nine or ten miles further, embracing also the valley of the Feugh. Some of the land in this district is fertile, and produces good crops; but a great part of the ground is still in little better than a state of nature, although to a considerable extent capable of, and in many places in progress towards, cultivation. In this district, trees have been planted to a greater extent than in any other part of the county, and the climate is peculiarly favourable to the growth of timber. The plantations greatly embellish the face of the country; and at many points, especially in the neighbourhood of the rising valley of Banchory, the prospect along the Dee is rich and beautiful. Plantations of firs extend in some places to the summits of the adjoining hills.

These three divisions, comprehending the more level and cultivated parts of the county, extend to about two thirds of the whole surface. The other third consists of the eastern range of the Grampian Mountains, by which the Dee-side district is divided from the Howe of the Mearns. This elevated region is exceedingly sterile and rugged; but in some of the glens through which the mountain-streams flow, there are spots of great natural beauty. On one of these spots, in a romantic situation, stands the shooting lodge of Glendye. The most prominent of the Grampian Mountains in this county are, Mount-Battock, which rises to nearly 3500 feet above t level of the sea; Clochnaben, remarkable for a protuberance of solid rock on its top, nearly a hundred feet in perpendicular height, and forming a well-known landmark to vessels at sea;[1] Kerloak, which rises nearly 1900 feet above the sea, commanding a view as far south as the Lammermuir Hills; and the hill of Fare, the scene of the battle of Carrichie, in 1562, between the Earls of Murray and Huntly, when the latter was slain.

The only streams deserving the name of rivers are, the Dee, which, as before mentioned, flows through the northern part of Kincardineshire for nine or ten miles, and forms the boundary for thirteen miles between this county and Aberdeenshire; and the North Esk, which divides Kincardineshire from Forfarshire on the south and west. The other streams are the Cowie, the Carron, and the Bervie, which fall into the German Ocean; the Luther, which joins the river North Esk; the Dye, the Avon, the Feugh, the Canny, and the Shiach, whose waters run into the Dee. These streams, although of inconsiderable magnitude, abound with trout and par; and their banks, with the adjoining braes and overhanging trees, are, in many places, highly picturesque and beautiful. There are no lakes of magnitude in this county. The Loch of Leys is the largest, being about two miles in circumference, and well stored with pike. In this lake are the ruins of an ancient edifice, built upon an artificial island, supported by piles of oak.

The wild animals found in this county are, the fox, the badger, the otter, the wild cat, the polecat, the weasel, and the hedgehog. Roe-deer are frequently found in the woods, and hares and rabbits are incredibly numerous. The muirs abound with grouse, and black game is not uncommon. Wild geese, and occasionally swans, are seen about the beginning of winter. Woodcock, snipe, wild duck, partridge, plover, curlew, heron, teal, and landrail, are common. Pheasants have been introduced, and their numbers are increasing. The sparrow-hawk and the falcon are frequently met with. There are but few reptiles. Adders are occasionally seen in the hilly districts. Seals breed in the caverns along the coast.

No coal has yet been discovered; but limestone is found in several places; at Tillywhilly, in the Dee-side district; near Fettercairn, in the Howe of the Mearns; and at Mathers, on the Coast-side; from which last place lime-shells are sold in considerable quantity, both for building and for manure. Native iron has also been found in a field at Balnakettle; and indications of iron ore are met with in various parts of the county. Granite, basalt, whinstone, sandstone, and plum-pudding stone, are the prevailing kinds of rock. Blocks of granite are scattered over the surface in the neighbourhood of the Grampians, both of a whitish colour like the granite of Aberdeen, and of a reddish colour like that of Peterhead. Part of the granite exported from Aberdeen is taken from the hill of Nigg in this county. At Stonehaven and at Laurieston, in the Coast-side district, quarries of sandstone afford excellent and durable materials for building. At Whistleberry, in the parish of Kinneff, millstones of valuable quality are manufactured from the pudding-rock found on the sea-coast. Jasper, quartz, and porphyry, are likewise found in many places; and specimens of asbestos have been found at Balnakettle. Zeolite is also found; and some of the caverns upon the shores near Stonehaven abound with stalactites. Pebbles of great variety and beauty of colour are found in many parts of the county, particularly in the parishes of Arbuthnot and St Cyrus. Scotch topazes, or cairngorums, are sometimes found in the mountain-streams of the Grampians. In the neighbourhood of Cowie, pipe-clay is dug, and sold for household purposes.

The towns and villages in Kincardineshire are more numerous than important. Stonehaven, the county town, is situated in a fine bay at the confluence of the waters of the Cowie and Carron, nearly midway between Aberdeen and Montrose, and contains upwards of 3000 inhabitants. The harbour, lately improved at an expense of L.8000, is more accessible than almost any harbour on the eastern coast. The sheriff and other county courts have been held at Stonehaven since 1660, when they were transferred by act of parliament from Kincardine, then the county town, by reason, as the act states, that in that town, "there was neither ane tolbuith, nor any house for parties to lodge into for their entertainment." Inverbervie is the only royal burgh within the county, and contains about 900 inhabitants. Johnshaven, four miles south of Inverbervie, contains a population of upwards of 1000. Laurencekirk, celebrated for its elegant manufacture of snuff-boxes, contains nearly 1400 inhabitants. Luthermuir, a manufacturing village, which has sprung up within these few years in the parish of Marykirk, has acquired a population of about 700 souls. The village of Banchory, beautifully situated on the north bank of the Dee, is rapidly increasing in size. The other villages in the inland part of the county are Drumlithie, Auchinblae, Fettercairn, Marykirk, and St Cyrus. Along the coast there are thirteen or fourteen fishing villages, inhabited by about 1500 individuals, solely supported by catching and curing fish. Of these villages, Findon is celebrated for its haddocks, prepared in a manner peculiar to this district.

The climate of Kincardineshire is different in the different districts of the county. In the mountainous parts, the weather, in winter and spring, is excessively severe. The climate in the low country has of late years been meliorated by the increase of wood and the draining of bogs and mosses, and is not inferior to the climate of other parts of Scotland in nearly the same latitude.

The elegant mansions of many of the proprietors, erected in the finest situations on their estates, and generally surrounded by trees, add much to the beauty and cheerfulness of the country. The principal country-seats are Inglismaldie, one of the seats of the Earl of Kintore; Arbuthnot House, the seat of Viscount Arbuthnot; Fasque, Mr Gladstoun; Durris, Mr Mactier; Fetteresso Castle, Mr Duff; Crathes, Sir Robert Burnett; Fettercairn House, Sir John Stuart Forbes; Drumtochty Castle, Mr Gammell; Ury, Captain Barclay; Netherley, Mr Silver; Dunnottar House, General Forbes. The farm-houses throughout the county have, during the last fifty years, been greatly improved; and many of them are not only commodious, but handsome. The steadings of offices have also of late been much improved. The mode of living, both of the landlords and tenants, corresponds with their enlarged and improved accommodation. It may be doubted, however, whether the custom, now adopted in many places, of lodging the farming servants in *bothies*, out of the family, has a tendency to add either to their comfort or good conduct.

In 1807, this county was divided amongst eighty proprietors. The number of separate estates is now eighty-three. Some of the larger estates have long been in the same families; but within the last fifty years one half of the land has changed hands, some of it two or three times. Of the present proprietors, twenty-seven are resident in the coun-

[1] "The four great landmarks at the sea,
Are Mount-Mar, Lochnagar, Clochnaben, and Benochie."

ty; the others are absentees, or only resident occasionally. Of the estates, two or three are above L.5000 of yearly rent; nine or ten above L.3000, and under L.5000; about twenty from L.1000 to L.3000; twenty-three from L.500 to L.1000; and the rest under L.500. The valued rent is L.74,921. 1s. 4d. Scots. The real rent, according to the property-tax returns in 1815, was L.94,861 sterling. Those returns, however, must have been considerably under the truth; and the real rent of the county cannot at present, according to a moderate calculation, be less than L.120,000.

The farms in the cultivated districts are in general under 200 acres in extent. Many do not extend to more than thirty or forty acres, and others are still smaller. In the hilly districts the pasture farms are necessarily of much greater extent. A considerable proportion in number of the tenants pay less than L.50 a year of rent each; but the number of small tenants will no doubt be lessened, through the operation of the act for reforming the parliamentary representation.

During the present century, agriculture in this county has made great progress. The example of improvement on a great scale was set by the late Robert Barclay Allardice of Ury, who, as stated by Sir John Sinclair, in his Statistical Analysis, "is entitled to have his name transmitted to posterity as the first, the most extensive, and the most systematical improver of land in the north of Scotland." The improvements begun in the latter part of the last century have been continued with much spirit down to the present time; and the greater part of the arable land of the county is now managed according to the most approved systems of modern husbandry, producing wheat, barley, bear, oats, peas, beans, clover, and turnips. Mangel-wurzel and ruta-baga are also cultivated. Improvements by draining, trenching, planting, and enclosing, are at present in progress on different estates to a considerable extent, especially the estate of Kingcausie, and on the extensive estate of Durris since the latter became the property of the present proprietor, Mr Mactier. Great facility has been given to agricultural improvements, by making new roads. There are now in this small county about eighty miles of turnpike road, which, with the other roads of communication, afford easy access to every part of the county. Lime, since the county was opened up by good roads, has been used as a manure to a great extent, upwards of 20,000 bolls being yearly imported at Stonehaven alone for that purpose. Both the improvement of land and the breed of stock have been encouraged by premiums given by agricultural associations. On almost every farm, the rearing and feeding of cattle is united with the raising of corn; and in some parts of the county the tenants depend more on cattle than on corn for the payment of their rents. The kinds of stock reared are the same as in the adjoining counties of Aberdeen and Forfar. The pure short-horn breed has been introduced by Captain Barclay of Ury, whose superior stock, both of cattle and sheep, is well known. In the mountainous district the pasturage of sheep is extensive, almost uniformly of the black-faced species. Pigs have of late years been fed in almost every part of the county, with advantage to the farmers. Butter and cheese, especially the former, are made to a greater extent than the home supply requires. On some farms cheese is made equal in quality to the best Stilton. The cheese made at Canterland is well known, and highly prized.

There are no extensive manufactures in Kincardineshire. At Stonehaven the woollen manufacture is carried on upon a small scale, and there are two flax-spinning mills. There are also mills for spinning flax at Bervie, Auchinblae, and Caldhame. There is an extensive whisky-distillery at Glenury; and porter and ale are brewed both at Stonehaven and Laurencekirk. Kelp is manufactured on the sea-coast. There is little direct foreign commerce, the inhabitants being supplied with articles of foreign produce through Aberdeen and Montrose. The principal articles of export are grain, potatoes, cattle, pork, butter, and eggs. Whisky and ale are also exported; and, in 1827, there was an exportation of herrings from Stonehaven, to the extent of 3500 barrels. Since that time the herring fishery has not been successfully, perhaps because not vigorously, prosecuted. The principal exportation of grain from the county is at the port of Montrose; but the exportation at the small port of Gourdon now amounts to about 20,000 quarters annually; and nearly that quantity was last year exported at Stonehaven. The principal articles of direct import are lime, coals, timber, slates, and salt. Two banking establishments have branches at the county town.

Kincardineshire contains eighteen entire parishes, and parts of three other parishes. The thirteen parishes in the south part of the county form the presbytery of Fordoun; the rest are attached to the presbyteries of Kincardine O'Neil and Aberdeen. The places of worship within the county are, nineteen parish churches, two chapels of ease connected with the establishment, four chapels of the Scotch Episcopal communion, three of the United Associate Synod, three of the Congregational Union, one of the Berean communion, one of the Wesleyan Methodists, and one Roman Catholic chapel; the last being connected with the Roman Catholic college at Blairs, where the chapel is situated. According to the returns made in consequence of the resolution of the House of Commons, 3d April 1835, the number of "examinable persons" belonging to the established churches was 19,539; and of those belonging to the other religious denominations 1975. The poor of this county are supported by voluntary contributions; no legal assessment for the support of the poor has yet been made.

The county of Kincardine, before the union, returned two members to parliament; it now returns one member. The number of voters forming the constituency, according to the corrected lists of 1835, is 910, of whom seventy-two are freeholders from the old roll, forty county proprietors not formerly enrolled, 581 agricultural tenants, 195 town and village proprietors and householders, ten parochial clergymen, and twelve parish schoolmasters. In conjunction with Forfarshire, this county furnishes a regiment of militia, and it raised by itself a regiment of local militia, containing 816 men. Along the coast there are three preventive or coastguard stations, with suitable accommodation for the officers and men, erected by government. Smuggling, formerly prevalent to a considerable extent, is at present unknown.

Amongst the remains of antiquity in Kincardineshire, the most conspicuous is Dunnottar Castle, formerly the principal seat of the earls marischal, now an extensive ruin. It is built on a high peninsular rock, projecting into the German Ocean, about a mile south from Stonehaven. The regalia of Scotland were deposited in this castle for safety in the time of the commonwealth. The ruins of the Castle of Fenella, with the remains of a vitrified wall, are still to be seen near Fettercairn. Part of the Kame of Mathers, an ancient place of strength, pitched like an eagle's nest on the point of a projecting rock, in the parish of St Cyrus, still remains for the inspection of the lover of antiquity. Green Castle, Whistleberry Castle, the Castle of Morphie, the Castle of Kinneff, the Thane of Cowie's Castle, and the Castle of Kincardine, are yet pointed out to visitors, or rather, in regard to some of them, the ground on which they stood, for the vestiges of these edifices are now nearly obliterated. Near the mansion-house of Fordoun are to be seen the remains of a Roman camp. In the vicinity of Stonehaven, traces of a Roman encampment are also observable; and at Raedykes, about three miles inland, an ancient camp, whether Roman or Caledonian it is difficult to say, is distinctly marked by an extensive foss, and wall or embankment. Here was dug up some years ago a chariot wheel composed entirely of massive iron. On the hill of Garvock is pointed out the Sheriff's Kettle, where the sheriff of the Mearns was boiled in a caldron by certain of the barons of the county, in the reign of James I. Druidical circles of rude stones are also to be seen at Auquhorthies, and on the hill of Garrol, upon the estate of Durris.

Amongst the celebrated writers connected with this county may be mentioned Dr Arbuthnot, Barclay, the author of the Apology, Bishop Burnett, Lord Monboddo, Dr Reid, and Dr Beattie.

The population of the county in 1811, 1821, and 1831, is shown in the following table. The total population in the last-mentioned year amounted to 31,431, of which number the towns and villages contained nearly one third. In 1831, the agricultural male servants were 2147 in number; other male servants 109, and female servants 2246. The population from 1801 to 1811 increased at the rate of four per cent.; from 1811 to 1821, at the rate of five per cent.; and from 1821 to 1831, at the rate of eight per cent.

KINCARDINE, a considerable and thriving town in the southern part of Perthshire, situated on the shore of the Frith of Forth, at the distance of five miles east from Alloa, four west from Culross, ten from Dunfermline, and twenty-two from Perth. Formerly there were a number of salt-works here, and at one time this place was called West Pans; but the manufactories are now gone, and the name is out of use. The houses of Kincardine are well built, but the streets are narrow and irregular. The seaport is one of the most thriving on the Forth, having now a good quay and harbour, and there being a considerable trade in the building of vessels, chiefly for coasting. There are upwards of fifty ship-owners, amongst whom a company has been formed for mutual insurance of their vessels, thus affording protection against individual loss at sea. In the town there are works for making sails and ropes, and a brewery. Distillation is carried on at Tulliallan, in the neighbourhood. Kincardine is a burgh of barony, under the government of several bailies. A fair is held here on the last Friday of July. The established church is at Tulliallan, but there is a dissenting meeting-house in the town. The population in 1821 amounted to 2500, and in 1831 to 1887.

KINDRED, in *Law*, persons related to one another, of whom the law reckons three degrees or lines, viz. the descending, ascending, and collateral line.

KINETON, a market-town of the county of Warwick, in the hundred of Kington, eighty-four miles from London, situated at the foot of Edgehill, where a battle was fought between Charles the First and the parliament army. The market is held on Tuesday. The inhabitants amounted in 1801 to 779, in 1811 to 800, in 1821 to 782, and in 1831 to 820, making, with the annexed chapelry of Combrook, 1102.

KING, a monarch or potentate who rules singly over a people. Camden derives the word from the Saxon *cyning*, which signifies the same thing; and that from *can*, power, or *ken*, knowledge, with which every monarch is supposed to be invested. The Latin *rex*, the Scythian *reix*, the Punic *resch*, the Spanish *rey*, and French *roi*, come all, according to Postel, from the Hebrew ראש, *rosch*, signifying chief, head. Kings were not known amongst the Israelites till the reign of Saul. Before his time they were governed at first by elders, as in Egypt; next by princes of God's appointment, as Moses and Joshua; then by judges till the time of Samuel; and lastly, by kings. Most of the Grecian states were governed at first by kings, who were chosen by the people to decide differences, and to execute a power which was limited by laws. They commanded armies, presided over the worship of the gods, and executed other functions. This royalty was generally hereditary; but if the vices of the heir to the crown were odious to the people, or if the oracle had so commanded, he was cut off from the right of succession; yet the kings were supposed to hold their sovereignty by the appointment of Jupiter. The ensign of majesty was the sceptre, which was made of wood adorned with studs of gold, and ornamented at the top with some figure, commonly that of an eagle, as being the bird of Jove. At first Rome was also governed by kings, who were elected by the people, with the approbation of the senate and concurrence of the augurs. Their power extended to religion, the revenues, the army, and the administration of justice. The monarchical form of government subsisted 244 years in Rome, under seven kings, the last of whom was Tarquinius Superbus. Amongst the Greeks the king of Persia had anciently the appellation of the Great King; the king of France now has that of the Most Christian King, and the king of Spain has that of Catholic King. The king of the Romans is a prince chosen by the emperor, as a coadjutor in the government of the empire. The king of England, by the Lateran council, held under Pope Julius II., had the title of *Christianissimus* conferred on him; and that of Defender of the Faith was added by Pope Leo X. though it had been used by them some time before. The title of Grace was first given to our kings about the time of Henry IV., and that of Majesty was first bestowed on Henry VIII., before whose time our kings were called Grace, Highness, and the like. In all public instruments and letters, the king styles himself *nos*, we; though till the time of King John he employed the singular number. The definition of king above given is according to the general acceptation of the term. It will not therefore strictly apply to the sovereign of Great Britain. The power of our king is subject to great limitations; but these are the limitations of wisdom and the sources of dignity, being so far from diminishing his honour, that they impart an additional glory to his crown.

The oath taken by the king at his coronation is conceived in these terms:—"*The archbishop or bishop shall say,* Will you solemnly promise and swear to govern the people of this kingdom of Britain, and the dominions thereto belonging, according to the statutes in parliament agreed, and the laws and customs of the same? *The king or queen shall say,* I solemnly promise so to do. *Archbishop or bishop.* Will you to the utmost of your power cause law and justice, in mercy, to be executed in all your judgments? *King or queen.* I will. *Archbishop or bishop.* Will you, to the utmost of your power, maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them, or any of them? *King or queen.* All this I promise to do. After this the king or queen, laying his or her hand upon the holy gospel, shall say, The things which I have here before promised, I will perform and keep, so help me God; and then shall kiss the book." This is the form of the coronation oath, as it is now prescribed by law. The principal articles appear to be at least as ancient as the Mirror of Justices, and even as the time of Bracton; but the wording of it was changed at the Revolution, because, as the statute alleges, the oath itself had been framed in doubtful words and expressions, with relation to ancient laws and constitutions at that time unknown. See ENGLAND.

KING at Arms, or *of Arms,* is an officer of great antiquity, and anciently of great authority, whose business it is to direct the heralds, preside at their chapters, and exercise the jurisdiction of armoury. In England there are three kings of arms, namely, Garter, Clarencieux, and Norroy.

The *Garter principal KING of Arms* was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea; on which occasion he used to be joined in commission with some principal peer of the kingdom.

The *Clarencieux KING at Arms* is so called from the Duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south side of the Trent.

The *Norroy KING at Arms* is an officer whose duty it is to do the same thing on the north side of the river Trent.

The two last are also called *provincial heralds,* because they divide the kingdom into provinces between them. By charter they have power to visit noblemen's families, to set down their pedigrees, to distinguish their arms, to appoint persons their arms, and with the garter king to direct the other heralds.

Anciently the kings at arms were created and solemnly crowned by the kings of England themselves; but in later times the earl marshal has a special commission at every creation to personate the king.

Lyon KING at Arms for Scotland is the second king at arms for Great Britain, and he is invested and crowned with great solemnity. To him belong the publishing of king's proclamations, the marshalling of funerals, the reversing of arms, and the like.

KING's or *Lord Advocate for Scotland.* The first in this office noticed by our writers was Sir John de Ross of Mountgreenan, who was appointed advocate to King James III. about the year 1483. Till his time there does not appear to have been any permanent officer named as king's advocate, but temporary appointments for particular causes only; as was likewise the case in early times in England, where the attorneys-general were not otherwise constituted till the end of the fourteenth century. Thus, in the claim set up in the parliament of Scotland to the forfeited estates of the Earl of March, appearance was made "procuratoribus et prælocutoribus excellentissimi principis et domini nostri actoris ab uno prosequentis," 1436, c. 135; and in the prosecution for treason in parliament against the Earl of Douglas in 1455, Lancelot de Abernethie was "proloquitor domini nostri regis." It was the clerk-register that raised and prosecuted in parliament the indictment for treason against Lord Boyd, November 1469; in the process of forfeiture in parliament against the Earl of Ross, 1475, it was the lord chancellor who conducted the prosecution and led the evidence; and in a process of treason, 1479, the king asked the award of parliament "be his chanceler and advocats." As respects the court of the lord-justiciar of Scotland, which, prior to the institution of the College of Justice, was the highest court next to the parliament, and possessed of both civil and criminal jurisdiction, it is well known that the clerk of court, or justice clerk, was long the only public prosecutor.

Sir John de Ross was succeeded in the office of king's advocate by Henryson of Fordel, who continued therein from 1494 till 1507, when he was made justice-clerk in the room of Lawson of Hierigs, appointed king's advocate. Both these offices of justice-clerk and king's advocate having become vacant in September 1513, by the fall of Lawson and Henryson on the fatal field of Flodden, Wischeart of Pittarrow was nominated to both places, and he continued to hold them till his death, when the office of king's advocate was given to Sir William Scot of Bahreary and Adam Otterburn of Redhall, both lords of council. In December 1528, Bahreary was despatched to England in a diplomatic capacity; and having in consequence resigned, he was succeeded by Sir James Foulis of Colinton, a lord of the session, who, however, on the institution of the College of Justice, accepted the place of clerk-register. Otterburn then became sole king's advocate, with the privilege of pleading within the bar of the new erected court, a privilege till then unknown in our juridical practice; for heretofore all pleaded within the bar, as indeed is still the case in the court of justiciary, where much of the old common law proceedings remain to this day; and in criminal cases the bar was occupied by the prisoner, who was thence styled the *panel,* a synonyme for *bar.*

To the same period may perhaps be traced the title of Lord Advocate: for, as early as the 2d April 1573, the king's advocate is so styled;[1] and in the statute 1587, c. 115, the title is given him as his accustomed designation. It had no doubt its origin in the circumstance of his being, from the erection of the court, a lord of session. This latter circumstance may seem the more remarkable of the two, but it admits of easy explanation, and it had its parallel in the old parliament of Paris. The constitution of the court of session, like the ecclesiastical tribunals after which it was modelled, was secret, and all its deliberations took place with closed doors. Provision was therefore to be made to secure to the crown a knowledge of its proceedings. Accordingly, at the institution of the court, the king's advocate, the king's treasurer, the clerk register, and the justice-clerk, were all made lords of session; and when no

[1] Pitcairn's *Criminal Trials.*

vacant seat existed, as was the case when Henry Lauder was appointed to officiate as king's advocate during Otterburn's absence in England in 1533, or where the party was precluded from taking it "be reason of his less age," as was the case when Sir Lewis Bellenden was appointed justice-clerk in 1578, the course adopted was to issue a royal warrant to remain in court during its deliberations. Where more than one individual held the office, as was commonly the case till the time of Sir Thomas Hope, the end in view was sufficiently attained if one only had right to remain in court; and this principle, it is believed, will be found to have been acted upon.

It was in the beginning of 1626 that Hope was appointed king's advocate, along with the aged Sir William Oliphant, a lord of session. The king then also conferred on Hope the honour of knighthood; and the court of session, by act of sederunt passed at the king's desire, allowed him to plead covered. This last ordinance has been strangely misapprehended by our writers; but, as Oliphant had just been removed from the bench, and Hope had no seat on it, there seems little reason to doubt that its object was to assert and clear the equality of the king's advocate with the judges, who then usually sat on the bench with their hats on, and of the number of whom the king's advocate had till now been one. It was not a personal but an official privilege, and was accordingly, with the other honours and privileges which had been enjoyed by Hope, confirmed to his successors by the act of sederunt dated the 2d of June 1649. Hope's learning and astuteness are well known; and as he held the office for no less a period than twenty years, and at a time when the king resided permanently in England, we need not be surprised at the very large powers enjoyed by him and his successors in his high office.

When Hope was appointed king's advocate, he was also appointed advocate to the Prince of Wales; but the latter office has since been always held separate, as it ought to be. In France, the advocate for the crown was also advocate for the church; but in Scotland, since the Reformation, this has never been the case. On the contrary, when Grant of Prestongrange accepted the office of king's advocate, the General Assembly voted the offices of their procurator and clerk, then held by him, vacant by such acceptance, and filled them up accordingly. Grant, however, had held the office of procurator to the church while he was solicitor-general, as did likewise some of his predecessors; and the learned Mr Thomas Craig seems to have been at the same time procurator to the church and advocate-depute.

The office of solicitor-general seems to be of no older origin in Scotland than about two centuries ago; and it was not till the time of Charles Erskine of Tinwald, in the beginning of last century, that this officer had right to sit and plead within the bar of the inner-house; for certainly by the act of sederunt of 28th February 1662, renewed 6th November 1690, the solicitor-general and one deputy of the lord advocate were allowed to remain within "the innermost bar" of the outer-house. The advocates-depute are of much older standing, though it was not till towards the end of the sixteenth century that the office was permanent. They are now four in number, appointed to attend the several circuits, and the Glasgow winter assize. The lord advocate has also a deputy in the court of exchequer. (U. U. U.)

King, *Dr John*, a learned English bishop, born at Worwall about 1559, was educated at Westminster School and at Oxford, and appointed chaplain to Queen Elizabeth. In 1605 he was made dean of Christ Church; for several years he was vice-chancellor of Oxford; and in 1611 he was advanced to the bishopric of London. Besides his Lectures upon Jonah, delivered at York, he published several sermons. King James I. used to style him "the king of preachers;" and Lord Chief-Justice Coke often declared that "he was the best speaker in the star-chamber in his time." He died on the 30th of March 1621, and was interred in St Paul's cathedral. Soon after his death it was reported that he had died a member of the Catholic church. But the falsehood of this story was sufficiently exposed by his son Dr Henry King, who was created bishop of Chichester, in a sermon delivered soon afterwards at St Paul's Cross; by Bishop Godwin in the Appendix to his *Commentarius de Præsulibus Angliæ*, printed in 1622; and by Mr John Gee, in his book entitled The Foot out of the Snare.

King, *Dr William*, a facetious English writer, born at London in 1663, was allied to the noble families of Clarendon and Rochester. He was elected a student of Christ Church from Westminster School in 1681. He afterwards entered upon the study of law, and having taken the degree of doctor of civil law, soon acquired a considerable reputation as a civilian, and obtained great practice. He attended the Earl of Pembroke, lord-lieutenant of Ireland, into that kingdom, where he was appointed judge-advocate, sole commissioner of the prizes, keeper of the records, and vicar-general to the lord-primate of Ireland. He died on Christmas day 1712, and was interred in the cloisters of Westminster Abbey. His writings are pretty numerous. The principal are, 1. Animadversions on a pretended Account of Denmark, written by Mr (afterwards Lord) Molesworth; 2. Dialogues of the Dead; 3. The Art of Love, in imitation of Ovid *De Arte Amandi;* 4. A volume of Poems; 5. Useful Transactions; 6. An Historical Account of the heathen Gods and Heroes; and, 7. Several translations.

King, *Dr William*, archbishop of Dublin, was descended from an ancient family in the north of Scotland, but born at Antrim in the north of Ireland on the 1st of May 1650. In 1674 he took priest's orders, and in 1679 was promoted by his patron, Dr Parker, archbishop of Dublin, to the chancellorship of St Patrick. In 1687 Peter Manby, dean of Londonderry, having published at London a pamphlet entitled Considerations which obliged Peter Manby, dean of Londonderry, to embrace the Catholic Religion, our author immediately wrote an answer. Mr Manby, encouraged by the court, and assisted by the most learned champions of the church of Rome, published a reply under the title of a Reformed Catechism, in two Dialogues, concerning the English Reformation, in reply to Mr King's Answer. Our author soon rejoined in a Vindication of the Answer. Mr Manby dropped the controversy, but dispersed a loose sheet of paper, artfully written, with the title of a Letter to a Friend, showing the Vanity of this Opinion, that every Man's Sense and Reason are to guide him in Matters of Faith. This Dr King refuted in a Vindication of the Christian Religion and Reformation against the Attempts of a Letter to a Friend. In 1689 he was twice confined in the Tower by order of King James II., and the same year created doctor of divinity. In 1690, upon King James's retreat to France after the battle of the Boyne, he was advanced to the see of Derry. In 1692 he published at London, The State of the Protestants of Ireland under the late King James's Government, in 4to; "a history," says Bishop Burnet, "as truly as it is finely written." He had by him at his death attested vouchers of every particular fact alleged in this book. However, it was soon attacked by Mr Charles Lesly. In 1693, our author, finding the number of Protestant Dissenters in his diocese of Derry increased by a vast addition of colonists from Scotland, in order to persuade them to conformity to the established church, published a Discourse concerning the Inventions of Men in the Worship of God. Mr Joseph Boyse, a dissenting minister, wrote an answer.

King.

The bishop answered Mr Boyse. The latter replied, and the bishop rejoined. In 1702 he published at Dublin, in quarto, his celebrated treatise *De Origine Mali*. Mr Edmund Law, fellow of Christ's College in Cambridge, afterwards published a complete translation of this work, with very valuable notes, in 4to. In the second edition he has inserted, by way of notes, a large collection of the author's papers on the same subject, which he had received from his relations after the publication of the former edition. In this excellent treatise the author has made many curious observations. He asserts and proves that there is more moral good in the earth than moral evil. A sermon by our author, preached at Dublin in 1709, was published, under the title of Divine Predestination and Foreknowledge consistent with the Freedom of Man's Will. This was attacked by Anthony Collins, in a pamphlet entitled a Vindication of the Divine Attributes; in some Remarks on the Archbishop of Dublin's Sermon entitled Divine Predestination, &c. He published likewise a Discourse concerning the Consecration of Churches, showing what is meant by dedicating them, with the Grounds of that Office. He died in 1720. Archbishop King, as appears by his correspondence with Swift, was a man of humour, and many of his witty sayings were at one time current.

King, *Dr William*, principal of St Mary's Hall, Oxford, son of the Reverend Peregrine King, was born at Stepney in Middlesex, in the year 1685. He was made doctor of laws in 1715; became secretary to the Duke of Ormond and Earl of Arran, as chancellors of the university; and was made principal of St Mary's Hall on the death of Dr Hudson in 1719. When he stood as candidate for member of parliament for the university, he resigned his office of secretary, but retained his other preferment, and it was all he did enjoy, till the time of his death. Dr Clarke, who opposed him, carried the election; and after this disappointment, he, in the year 1727, went over to Ireland, where he is said to have written an epic poem called *The Toast*, which was a political satire, printed and given away to his friends, but never sold. On the dedication of Dr Radcliffe's library, in 1749, he spoke a Latin oration in the theatre of Oxford, which was received with the highest acclamations; but it was otherwise treated when printed, for he was attacked in several pamphlets on account of it. Again, at the contested election for Oxfordshire in 1755, his attachment to the old interest drew on him the resentment of the new, and he was libelled in newspapers and pamphlets, against which he defended himself in an Apology, and warmly retaliated on his adversaries. He wrote several other things, and died in 1762. He was a polite scholar, an excellent orator, an elegant and easy writer, and was esteemed by the first men of his time for his learning and wit.

King, *Peter*, lord high chancellor of Great Britain, the son of an eminent grocer and salter, was born at Exeter in 1669, and bred up for some years to his father's business; but his inclination to learning proved so strong that he laid out all the money he could spare in books, and devoted every moment of his leisure hours to study. He thus became an excellent scholar before the world suspected any such thing; and gave the public a proof of his skill in church history, by his Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church, that flourished within the first three hundred years after Christ (London, 1691, in 8vo). This was written with a view to promote the scheme of a comprehension of the Dissenters. He afterwards published the second part of the Inquiry; and having desired, in his preface, to be shown, either publicly or privately, any mistakes he might have committed, that request was first complied with by Mr Edmund Elys, between whom and our author there passed several letters upon the subject, in 1692, which were published by Mr Elys in 1694, under the title of Letters on several Subjects. But the most formal and elaborate answer to the Inquiry appeared afterwards, in a work entitled Original Draught of the Primitive Church.

Books of Kings || King's County.

His acquaintance with Mr Locke, to whom he was related, and who left him half his library at his death, was of great advantage to him. By the advice of that great philosopher, after he had been some time in Holland, he applied himself to the study of the law, in which profession his learning and diligence soon made him noticed. In the two last parliaments of the reign of King William, and in five parliaments during the reign of Queen Anne, he served as burgess for Beer-Alston in Devonshire. In 1702, he published at London, without his name, his History of the Apostles' Creed, with critical observations on its several articles; a work which is highly esteemed. In 1708 he was chosen recorder of the city of London; and, in 1710, he was one of the members of the House of Commons at the trial of Dr Sacheverel. In 1714 he was appointed lord chief justice of the common pleas; and the April following he was made one of the privy council. In 1715 he was created a peer, by the title of Lord King, Baron of Ockham in Surrey, and appointed lord high chancellor of Great Britain, in which situation he continued till 1733, when he resigned. He died at Ockham, in Surrey, in the year 1734.

Books of Kings, two canonical books of the Old Testament, so called because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon till the Babylonian captivity, that is, for the space of nearly six hundred years. The first book of Kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms. The rest of the book is occupied in relating the acts of four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of sixteen kings of Judah, and twelve of Israel, and the end of both kingdoms, by the carrying off the ten tribes captive into Assyria by Shalmanasar, and the other two into Babylon by Nebuchadnezzar. It is probable that these books were composed by Ezra, who extracted them out of the public records which had been kept of what passed in that nation.

KING'S County, an inland county of the province of Leinster, in Ireland, is bounded on the north by the county of Westmeath, on the east by the county of Kildare, on the south by the Queen's county and Tipperary, and on the west by the counties of Tipperary, Galway, and Roscommon. In its greatest length from south-west to north-east it measures upwards of fifty miles, and forty-two in its greatest breadth from east to west, but the irregularity of its shape prevents the deduction of any practical inference as to its dimensions from these premises. Its actual extent is 528,166 acres, of which 394,569 are capable of cultivation, 133,349 are unprofitable mountain or bog, and not more than 248 are under water.

In the earliest periods of Irish history, this county formed part of the territory of Hy-Falgia, and was also known by the name of Hy-Laoighis, a denomination that comprehended also the Queen's county and some other districts. The southern part of it afterwards obtained the name of Ely O'Carroll. It was also known by that of the kingdom of Offaly. In the reign of Philip and Mary it was reduced into shire ground, and assumed the title it still retains, when its assize-town also took its name from the above-named king. At that time the heads of the principal clans were, the O'Conor-Falies, the O'Carrolls of Ely O'Carroll, the M'Egans, the O'Delanys, and the O'Meaghers. It is now divided into the twelve baronies of Ballyboy, Ballycowan, Ballybritt, Clonlisk, Coolestown, Eglish or Fircal, Garrycastle, Geashill, Kilcoursey, Upper and Lower Philipstown, and Warrenstown. These are again subdivided into forty-four parishes, besides seven parts of parishes, the remaining parts of which are in some of the adjoining counties.

According to former ecclesiastical arrangements of Ireland, this county comprehended parts of the dioceses of Kildare, Meath, Killaloe, Ossory, and Clonfert; but under the new distribution of the dioceses it is comprehended in those of Dublin, Meath, Killaloe, and Ferns.

The surface of the country is for the most part level and uninteresting; the great field of flœtz limestone, that forms so much of the soil of Ireland, spreading itself over all but its southern portion. Beds of foliated limestone, of a greenish hue and a large granular texture, adapted for various useful purposes, are found at Tullamore. In the south-east, the Slieve Bloom Mountains extend in a direction from north-east to south-west for twenty miles, forming the line of demarcation between the King's and Queen's counties. They are steep and craggy, and have but one opening by which they can be crossed, called the Gap of Glandine. They consist of a nucleus of clay, surrounded by sandstone, with tracts of irreclaimable bog at their base. Pure white clay, of a quartzose nature, is found in them. Croghan Hill, in the northern extremity of the county, rises above the surrounding level to the height of more than five hundred feet, clothed with verdure to its summit. It is composed of trap, conglomerate, and flœtz limestone. On those parts of its surface the basis of which is lime, the soil is extremely barren; whilst on the other parts it is peculiarly fertile, producing, from time immemorial, good crops of oats and potatoes, without manure. The difference is so marked, that the line of junction of the two formations can be traced by the verdure on the surface. Another elevation of the country, but less remarkable than that of Croghan, is the hill of Cloghan, between the river Brosna and the Slieve Bloom Mountains. Numerous and abundant springs gush from it on all sides. The minerals found here are iron in small quantities, manganese, ochre, chalk, and potters' clay. The only river that can strictly be considered as belonging to the county is the Brosna, which rises in the county of Westmeath, and discharges itself into the Shannon. This latter river forms a considerable part of the western boundary of the county. The Barrow is its boundary to the south-east, and the Boyne skirts a small portion of its north-eastern extremity. The Lesser Brosna, also a branch of the Shannon, divides the county from Tipperary. The only lake within the county is Lough Pallis, of inconsiderable dimensions. The divisional line which separates the Queen's county passes through the middle of Lough Annagh, the northern portion of which is therefore considered as belonging to the King's county. It is of inconsiderable size, not covering more than 315 acres. Lough Boura, containing 175 acres, is so shallow that it may be safely forded in summer-time.

The soil is in general either a deep moor or a shallow gravelly loam; the former is the more productive in dry seasons, the latter in moist. Limestone is abundant in most parts. The pastures, though not luxuriant, form good sheep walks; that on the more mountainous tracts has proved excellent for young cattle. In reclaimed bog, corn crops are some weeks later in ripening than elsewhere, although the natural vegetation is earlier than in the upland pastures. A considerable portion of the great bog of Allen is in this county.

The latest return of the population gives an average of one soul to every four acres, or of about one to every $2\frac{3}{4}$ acres of cultivated land. The returns of the number of inhabitants at various periods are as follow:—

1760, De Burgo	45,618
1792, Beaufort	74,500
1813, Parliamentary census	113,226
1821, Ditto	131,088
1831, Ditto	144,029

The proportion of Protestants to Catholics is about one to four; the number of dissenters is inconsiderable.

The county was represented in the Irish parliament by six members; two for the county at large, and two for each of the boroughs of Philipstown and Banagher. The boroughs were deprived of the right of returning members at the union; and as the reform act has introduced no change into the arrangements then made, the county is now represented only by two members. The state of the constituency, as affected by the various changes made since the year 1829, is shown in the following table, exhibiting the number of electors of the different rates of franchise:—

Years.	L.50.	L.20.	L.10.	40s.	Total.
1st Jan. 1829,	842	95	—	1083	2020
1st Jan. 1830,	858	127	154	—	1078
1st May 1832,	346	225	739	—	1310

The peace of the county is maintained by a constabulary force, consisting of five chief constables, forty-eight constables, and 144 sub-constables, total 197, at an expense of L.9124 per annum, being an average of forty-seven pounds each man nearly.

The number of children receiving education in public schools was, in

Date.	Boys.	Girls.	Sex unascertained.	Total.
1821,	5531	2601	—	8,132
1824–26,	5787	3929	423	10,139

Of the numbers stated in the latter return, 2064 were of the established church, 7959 Roman Catholics, twenty-two dissenters, and ninety-four whose religious persuasion was not ascertained. The total number of schools was 254, thirty of which, containing 1854 pupils, were supported by grants of public money; twenty-four, containing 1404 pupils, by voluntary subscriptions; and the remaining 200, containing 6881 pupils, were maintained by the fees of those instructed.

The crops usually raised are, wheat, oats, barley, and potatoes. Oxen are frequently employed in field labour; a mode of yoking them by the horns is much approved by some intelligent farmers, as being less irritating to the animal, and giving a better direction to its powers. Green crops are very general; rye-grass is much encouraged for early feeding. Great attention is paid to the rearing of horses, in consequence of which the county can boast of a fine breed. The uplands and moors are chiefly employed in feeding young cattle and sheep. The wool of these latter is highly esteemed at Ballinasloe. In the northern baronies there are many dairies, in some of which cheese of a good quality is made. Lime, and limestone gravel, either by itself or formed into a compost with the gatherings of the farm refuse, constitute the general manure. The gravel burned in heaps, with the parings of the moors, produces very heavy crops. Bog stuff is also often used for manure.

There is every reason to suppose that the greater portion of this county was once an uninterrupted forest. Wherever the timber is protected it grows up to great size and beauty. The parts bordering upon Tipperary are richly wooded. Alder is indigenous. The ash grown here is preferred to any other by the Dublin workmen. The bogs furnish an inexhaustible supply of fuel, not only

King's County.

from their own peculiar vegetation, but from the trunks and roots of trees raised from them, which produce a quick and lively fire. Notwithstanding the great prevalence of bog, the general surface of the land is of considerable elevation, affording great facilities for conducting the superfluous moisture to the rivers which intersect the country in all directions. The fences are generally of white thorn, which thrives remarkably well here.

The condition of the peasantry, though more comfortable than in some other parts of Ireland, is notwithstanding low in comparison with that of the English of the same class. The houses are small and poor, mostly covered with thatch, and seldom weatherproof. Earthen walls and straw roofs are preferred by most, not only from habit, but as being warmer than stone and slate. Fuel is everywhere plentiful, the bogs furnishing an inexhaustible supply of excellent quality. The food, in general, is potatoes and oatmeal; bearmeal is used in some parts. In Kilcoursey, most of the cottiers' families consume a bacon pig annually. The peasantry are industrious when excited by what they deem adequate remuneration. The young men frequently leave home in quest of employment, rather than work for wages which they consider as too low. The women are remarkable for their industry, insomuch that youths of provident habits who reside elsewhere, frequently come hither in quest of wives. Besides their household occupations, the women prepare the materials for the manufacturer. The desire for education is sufficiently indicated by the number of small schools. Irish and English are indifferently spoken, though, in the intercourse of the lower classes with each other, the former is preferred.

The only manufactures carried on are those of wool and linen; but the quantities wrought are merely sufficient for the home consumption. The Grand Canal, which crosses the county from east to west, affords a cheap and expeditious mode of conveying its superabundant produce to other parts. Breweries and distilleries absorb most of the grain raised in the county.

Remains of antiquity of very remote date are frequent. In the Slieve Bloom Mountains there is a large pyramid of white stones, called the Temple of the Sun, or the White Obelisk. Of Danish raths, which are numerous, the most remarkable is that in Finglas parish. A chain of moats, chiefly situated at the passes of the bogs, may be traced throughout the county. At Clonmacnois are two round towers and several stone-crosses. This sequestered spot was the site of several places of religious observance, whence its name of the Seven Churches. It was also a bishop's see, which merged in that of Meath in 1568. There were three religious houses at Killeigh. Monasteroris Monastery, founded by one of the Bermingham family, in the district called Thotmoy, was a place of great repute. Durrow was also the site of an extensive abbey. The remains of military antiquities are still more numerous. Rathmore Castle, the area of which comprehended two acres, is looked upon as the oldest in the county. At Banagher are the remains of a fortress which commanded an important pass over the Shannon. Birr or Parsonstown Castle, formerly the residence of the O'Carrols, having fallen into the hands of the Parsons family, is now the residence of Lord Ross. Cangor Castle, in Clonlisk barony, is noted for its defence against the Irish, by whom it was ultimately taken and burned, and its garrison put to the sword.

The population is mostly rural. The towns are few and small. Philipstown, where the assizes are held, had but 1454 inhabitants at the period of the census of 1831. It is a market and post town, and is situated on the line of the Grand Canal, though it has not derived any commercial advantage from its proximity to that line of communication. The town was visited by Philip II. king of Spain, who lodged in Forth Castle, now a gentleman's seat. It is well built and paved. Its public edifices are, a church, a Roman Catholic chapel, court-house, jail, and barracks, as also a school on the foundation of Erasmus Smith. The place was formerly the site of Dingan Castle, the residence of the O'Conors, who were driven from it in 1546 by Sir William Bellingham, and forced to fly to Connaught. The town was taken and burned by King James's forces in 1690.

Parsonstown has lately risen from an obscure village to the rank of a populous, well-built, and thriving town, the resort of many families of respectability. The church is an elegant modern building of the Gothic style. In the town is a pedestrian statue of the Duke of Cumberland, who commanded the English army in 1745. Its population is 6594. The numbers of inhabitants in each of the other towns whose population exceeds 1000 souls are as follow: Banagher 2641, Shinrone 1287, Edenderry 1283, Clara 1149, and Frankfort 1112. Tullamore, on the river Clodagh, owes its present improved condition chiefly to the spirit of the inhabitants, who have taken advantage of the Grand Canal, which passes by it, in order to make it an emporium of considerable inland trade; but also in some degree to a conflagration which destroyed most of the mean and ruinous huts of which before it chiefly consisted. Its principal building is the parish church, an elegant modern structure. It contains 6342 inhabitants.

Kinghorn.

KINGHORN, a small burgh in Fife, which joins with Kirkcaldy, Dysart, and Burntisland in sending a member to parliament. For its constituency, see KIRKCALDY. It has charters from King Alexander III. dated 26th June 1284; from King David II. dated 2d July 1364; from King James V. dated 30th August 1541; and from King James VI. dated 12th December 1611. By these charters its privileges as a burgh, and its right to the harbours of Pettycur and Kinghorn, with its lake, lands, and mills, are confirmed. The revenue of these amounted in 1832 to L.670. They were then valued at L.13,114, and the debts upon them amounted to L.5836. 2s. 5d. The various projects for improving the harbours are mentioned in the article FORTH, and a negotiation is at present (1836) going on for their execution, by a joint-stock company. The extent of the lake of Kinghorn is about twenty imperial acres, and the length of the stream flowing from it to the sea is nearly 1000 yards. The height of the mill-sluice upon it above the level of the high-water mark is about 178 feet ten inches. Six mills were, within the last thirty years, driven by the waters flowing from it, and there might have been a seventh. There are at present upon it a meal and barley mill, and three flax spinning-mills, turning, with the aid of powerful steam-engines and their water-wheels, 3660 spindles. The other waterfalls are at present unemployed. Flax spinning is the principal trade of the town. The shipping trade, besides that of the ferry, is of little importance, consisting only of one large brig and two coasting vessels. The government of the town is vested in a provost, two bailies, a treasurer, thirteen councillors, and five police commissioners, chosen by the inhabitants, under the act 5 and 6 William IV. cap. 63. It has also five incorporated trades. The principal buildings are the town-house, erected on the site of an old Saxon building called St Leonard's Chapel, and the schools. Both buildings are from plans by Mr Hamilton of Edinburgh. The prison, with its airing ground, annexed to the town-house, is, with the exception of the jails at Kirkcaldy and Cupar, the best in the county. The schools belong to the burgh, but were erected by private subscription; and the gardens were gratuitously laid out chiefly by the working classes. The principal teacher is chosen by the burgage and land-ward heritors; the burgage heritors pay half of his salary, and the landward heritors the other half. There is an infant school-room, a geological museum and library-room, and a drawing school-room, within the buildings. Upwards of an acre of ground is laid out with shrubbery, and the borders of the walks contain a selection of plants, arranged with tallies bearing their names, and classes, and orders; a portion of the ground forms a bowling-green, and another contains the usual erections for gymnastic exercises. Besides the parish church, there is in the burgh an Associate Secession meeting-house and a Baptist chapel, both of which are well attended. This little town, from its ample revenue and increasing trade and population, bids fair soon to become one of the most prosperous in the county. Much has been done within the last ten years in opening up streets and removing ancient deformities; .and the operations at present in progress, under the police commissioners, to carry water in pipes through all the streets, and to light them with gas, will add further to the comfort of its inhabitants. Population in 1831, 2579.

KINGHORN *Ferry* (see FORTH). This has been a public ferry from the earliest period of Scottish history. By an act of parliament passed in 1474, the freight for the portage of man and horse at Kinghorn was to be six pennies Scotch, and for the man separately two pennies Scotch. In 1551, parliament raised the freight for the portage of the man and horse to twelve pennies Scotch, and for the man separately to six pennies Scotch; and also provided that the ferrymen were never to charge more, under pain of death, and confiscation of all their goods. On the 20th of May 1800, the ferrymen were allowed by the justices at their quarter-sessions to charge passengers, of freight ninepence sterling for the best seats in their boats, and sixpence for the seats before the mast. At present (1836) the freights of passengers are as high as two shillings sterling for the best and eighteenpence for the inferior sittings on board the steamers navigating these ferries.

KINGSBRIDGE, a town of the county of Devon, in the hundred of Stanborough, 207 miles from London. It stands at the mouth of Salcomb River, over which is a bridge. It has a good market, which is held on Saturday, is neat and well built, and has a grammar-school endowed. The inhabitants amounted in 1801 to 1117, in 1811 to 1253, in 1821 to 1430, and in 1831 to 1586.

KINGSBURY, a large parish of the county of Somerset, in the hundred of East Kingsbury, 128 miles from London. It is chiefly agricultural, with some few linen manufactures. The inhabitants amounted in 1801 to 1134, in 1811 to 1181, in 1821 to 1470, and in 1831 to 1695.

KINGSCLERE, a town of the county of Hants, in the hundred of the same name, fifty-four miles from London. There is a good market, which is held on Tuesday. The chief trade is in malting for the London brewers. The inhabitants amounted in 1801 to 1939, in 1811 to 1863, in 1821 to 2296, and in 1831 to 2532, and with the chapelries of Ecchinswell and Sidmonton, 3151.

KING'S-LANGLEY, a town of the hundred of Dacorum, in the county of Hertford, twenty miles from London. It stands near the river Colne, and was formerly the residence of Henry III. The inhabitants amounted in 1801 to 970, in 1811 to 1108, in 1821 to 1242, and in 1831 to 1423.

KING'S-NORTON, a parish of the county of Worcester, in the hundred of Halfshire, 116 miles from London. It is on the Stratford-on-Avon Canal, four miles from Birmingham, and participates in some branches of the trade of that town. It has now no market, though one was formerly held. The inhabitants amounted in 1801 to 2807, in 1811 to 3068, in 1821 to 3651, and in 1831 to 3977.

KINGSTANLEY, a town in the county of Gloucester, in the hundred of Whitestone, 105 miles from London. It was formerly a borough, and anciently the residence of the Saxon king of Mercia. The inhabitants amounted in 1801 to 1434, in 1811 to 1722, in 1821 to 2269, and in 1831 to 2438.

KING'S-TEIGNTON, a town of the hundred of Teignbridge, in the county of Devon, 185 miles from London. It is chiefly agricultural. The inhabitants amounted in 1801 to 856, in 1811 to 1001, in 1821 to 1131, and in 1831 to 1288.

KINGSTON, a town of the hundred of the same name, in the county of Surrey, ten miles from London. It is sometimes called, to distinguish it, Kingston-on-Thames, as it is situated on the right bank of that river, over which there is a handsome bridge, lately erected. It is one of the three county towns of Surrey. The spring assizes are held at it, as well as the sessions; and there is a large county jail. It is a corporate town, governed by bailiffs, a recorder, and justices. Formerly two members were returned to parliament. This place is supposed to have been the residence of one of the Saxon kings, and to have derived its name from that circumstance. There is but little trade except that of making malt, but there is a good market on Saturday. The inhabitants amounted in 1801 to 3793, in 1811 to 4144, in 1821 to 4908, and in 1831 to 5989.

KINGSTON, the capital of Jamaica. See JAMAICA.

KINGSTON, a town of Upper Canada, is advantageously situated on the northern bank of Lake Ontario, at the head of the river St Lawrence, and is separated from Points Frederick and Henry by a bay which extends a considerable distance to the north-west beyond the town, where it receives the waters of a river flowing from the interior. Point Frederick is a long, narrow peninsula, extending about half a mile into the lake in a south-easterly direction, distant from Kingston about three quarters of a mile, on the opposite side of its bay. This peninsula forms the western side of a narrow and deep inlet, called Navy Bay, from its being the chief harbour of the British navy on Lake Ontario. The extremity of the point has a strong battery, and there is a dock-yard with storehouses, and the like. Point Henry, forming the eastern side of Navy Bay, is a high, narrow, rocky ridge, extending into the lake, and crowned by a fort built on its extremity. The dock-yard, storehouses, slips for building ships of war, naval barracks, wharfs, and the like, are on an extensive scale, and in a very short period of time a formidable fleet could be equipped at this place. Next to Quebec and Halifax, Kingston is the strongest town in British America; and, with the exception of the former city and Montreal, it is the first in commercial importance. It has risen rapidly of late years, by becoming, through the means of the Rideau Canal, the main entrepôt between the trade in the lower province and all the settlements on the great lakes to the westward; and, from the measures now in progress to render the St Lawrence navigable between Montreal and Lake Ontario, it may be expected to increase yet more rapidly. The town is regularly laid out, whilst many of the houses are built of stone, and are both spacious and commodious. The public buildings are, a court-house, a government-house, a jail, an hospital, and several churches, besides the garrison, naval depôt, and other places already mentioned. The harbour, which is one of the best on the lake, is well sheltered and convenient; and here, from the commencement of spring till the latter end of autumn, great activity prevails. In 1828 the population of Kingston was 3528, and in 1834 it had risen to nearly 6000.

KINGSTON-UPON-HULL. See HULL.

KINGSWINTON, a town of the county of Stafford, in the hundred of Stourbridge, 124 miles from London. It is connected by canal navigation with the chief ports of the kingdom, and has become populous and opulent by its manufactures of glass and pottery. The inhabitants amounted in 1801 to 6464, in 1811 to 8267, in 1821 to 11,022, and in 1831 to 15,156.

KINGTON, a town of the county of Hereford, in the hundred of Huntington, 155 miles from London, with a good market on Wednesday. It stands on the river Arrow, is well built, and has a good free-school, and some trade in woollen goods. The inhabitants amounted in 1801 to 1424, in 1811 to 1617, in 1821 to 1980, and in 1831 to 2147.

KINROSS-SHIRE, a county in Scotland, bounded on the north-east, east, and south by the county of Fife, and on the north and west by Perthshire, is about twelve miles in length from east to west, and ten miles in breadth from south to north; but, according to the latest survey, contains only seventy-eight square miles, or 49,920 English acres, being one of the smallest counties in Scotland. Kinross, the county town, situated nearly in the centre, is in north latitude 56. 15. and west longitude from Greenwich 3. 10.

Kinross-shire is the highest level ground in the peninsula formed by the Forth and the Tay, which was formerly called Ross, or the promontory, and included the counties of Fife, Kinross, and Clackmannan. From this county the waters flow in every direction. The greater part of the soil is dry, resting on gravel; but part of it is damp, resting on till, with considerable fields of moss and muir. The whole has been very much improved of late. The productive land may extend to 30,000 acres, or about three fifths of the whole. The only lake it contains worth noticing is Lochleven, which is in the vicinity of Kinross. This lake was originally about fifteen miles in circumference, and covered an area of 3308 acres; but, by a recent drainage, ground to the extent of about 900 acres has been laid dry, and is in the course of being improved. It abounds in trout of excellent quality, pikes, perches, and eels. There are several islands in it, all of which have been enlarged by the drainage. On one of these, about four acres in extent, stands the Castle of Lochleven, in which Queen Mary was confined; and another, called St Serf's Island, extending to about sixty acres, contains the ruins of a monastery. Several rivulets flow into this lake, of which the principal are the Gairny, the South Queich, and the North Queich; and the river Leven, the only stream of any note in the district, issues from its eastern extremity, and, after passing through a considerable part of the county of Fife, enters the Frith of Forth at the town of Leven. The prevailing rocks are whinstone, sandstone, and limestone. Coal has been found on the estate of Blair-Adam; it is wrought at Kelty, in the parish of Cleish, on the southern boundary of the county.

Kinross-shire is divided into a number of small estates. Only about ten proprietors hold of the crown; the others hold of these freeholders, the lands having been feued out to them, for the most part, about the end of the seventeenth and beginning of the eighteenth century, for payment of a feu-duty. Hence, over the greater part of the county, every single farm is a separate property, possessed for the most part by its owner. The valued rent is L.20,250. 4s. 3d. Scots, and the real rent, according to the *Agricultural Survey*, published in 1814, was L.14,541. 10s. sterling; but it is now much increased, and cannot be taken at less than nearly double that sum. In 1811, the number of freeholders was only fifteen. When the land is let out to tenants, the leases are from fourteen to twenty-one years, except in the neighbourhood of the villages, where they are for a shorter period; and the rent is paid in money, the amount being in some instances regulated by the fiars. The size of the farms is from 100 to 300 acres. A fair proportion of them is in grass, for which both the soil and climate are favourable; and much of the land is enclosed either with stone-walls or hedges. The principal corn crops are oats and barley; wheat, though partially cultivated, does not enter into the regular course of cropping. Potatoes, turnips, and clovers, with rye-grass, are raised in every part of the county. On the banks of the Leven and the Gairny there were formerly meadows of considerable extent; but these have been drained and cultivated, and now form very productive land. The pastures of the cultivated land are occupied by cattle. Sheep are kept in numbers only on the Cleish Hills, and on that part of the Ochills which belongs to this county. Not much of the district is under wood. The most considerable plantations are on Blair-Adam, the estate of Lord Chief Commissioner Adam, and they are for the most part in a very flourishing state.

Besides Kinross the county town, and Milnathort, this county contains several villages. In 1831, Kinross contained a population of about 2400, and Milnathort about 1600. At both these places several annual fairs are held; and a weekly market for the sale of grain is held in the latter. Little manufactures are to be found here; the weavers are employed by the manufacturers of Glasgow. Assessments are resorted to for the poor of the villages, but those of the country parishes are relieved by voluntary contributions.

Kinross-shire sends a member to parliament along with the county of Clackmannan. Both counties are under the jurisdiction of one sheriff, who has a substitute for each. There are only four entire parishes, viz. Cleish, Orwell, Kinross, and Portmoak, with portions of other three; the first three belong to the presbytery of Dunfermline, and the fourth to that of Kirkcaldy, both under the jurisdiction of the synod of Fife. The population in 1811, 1821, and 1831 is given in the annexed abstract. By the returns for the first of these years, there were about ninety-three inhabitants to the square mile.

See *Beauties of Scotland*, vol. iv.; *General Report of Scotland*, vol. i.; Playfair's *Geographical and Statistical Account of Scotland*, vol. i.; Dr Graham's *General View of the Agriculture of Kinross and Clackmannan*; and, for its antiquities, Sibbald's *History of Fife and Kinross.*

KINSALE, a town of Ireland, in the county of Cork, is situated on a bay at the mouth of the river Bandon, which forms a fine harbour called the harbour of Kinsale. The town, being built upon the side of a hill, presents a fine prospect; but, on entering it, the streets are found to be narrow, and the communications difficult, from the steepness of its declivities. It was much more frequented than Cork by the early English monarchs, who bestowed on the place extensive privileges, and viewed it as the key of southern Ireland. It has now, however, sunk under the superior importance of its neighbour. Its port is comparatively little frequented, except as a watering place; but a considerable fishing trade is carried on. Kinsale underwent two sieges, one in the time of Elizabeth, and another in that of William. James II. also landed here on his arrival to recover his throne. The town gives the title of baron to the head of the De Courcy family, who enjoys the singular right of appearing covered in the presence of royalty. The population amounts to 7688.

KINZIG, one of the six circles into which the grand duchy of Baden is divided. It extends over 543 square miles, comprehending twenty-seven cities and market-towns, 180 villages, and 518 hamlets, with 198,500 inhabitants. About two thirds of the population adhere to the Catholic church, and the remainder are chiefly Lutherans. The greater part of the circle consists of the most lofty parts of the Black Forest; but between the hills, in which many rivulets and rivers run, there are some beautiful and fruitful valleys, which are well cultivated. The circle yields more corn than is wanted for consumption at home. The wine is of moderate quality, and, in some of the districts, excellent. The chief articles which are exported are corn, wood, hemp, flax, tobacco, straw-plat, and many wooden clocks, on the last of which great ingenuity is displayed. The circle is divided into fifteen bailiwicks. The capital is Offenburg. The name is derived from the river Kinzig, which falls into the Rhine.

KIPPIS, Andrew, a learned and eminent English nonconformist divine and biographer, was born at Nottingham, on the 28th of March 1725. On the death of his father, he was, at the age of five, removed to Sleaford, in Lincolnshire, where he received his grammatical education, and gave such early proofs of talents and progress as attracted the notice of Mr Merrivale, the pastor of a congregation of dissenters at that place. To this excellent man it was probably owing that young Kippis directed his views to the profession of a dissenting minister, and to those studies in which he afterwards so much excelled. In 1741 he was placed under the tuition of Dr Doddridge in the academy at Northampton, a seminary at that time in high reputation. Of the advantages which this institution afforded him Mr Kippis knew how to make the best improvement; and his regular conduct and proficiency secured him the esteem of his excellent tutor. Having completed his course of studies in five years, he was invited to a dissenting congregation at Dorchester; but he gave the preference to a similar call from Boston, in Lincolnshire, in 1746, where he remained till 1750, removing from thence to Dorking, in Surrey, and, two years afterwards, to Long Ditch, Westminster, in the room of Dr Hughes, deceased. This was in October 1753; in the preceding month he had married Miss Elizabeth Bott, the daughter of a merchant at Boston.

The situation, for which Mr Kippis was eminently qualified by his extensive abilities, being now respectable, introduced him to useful and honourable connections. He became a manager of the presbyterian fund for assisting poor congregations in the country in supporting their ministers; and in 1762 he was chosen a member of Dr Williams's trust, for nearly similar purposes, together with the doctor's valuable library, which afforded him opportunities of very extensive usefulness. In 1762, he signified amongst his friends his design of taking private pupils, and was on the eve of entering into engagements with the parents of two or three young gentlemen, when a more honourable though less lucrative employment was offered him. He was appointed classical and philological tutor in Coward's academy, an office which he filled for upwards of twenty-five years, with uncommon reputation to himself, and unspeakable advantage to his students. He received the degree of doctor of divinity from the university of Edinburgh, by the unsolicited recommendation of the learned Professor Robertson, in 1767; in 1778 he was made a member of the Antiquarian, and in 1779 a fellow of the Royal Society.

His literary engagements having become extremely numerous, he was, in 1784, obliged to resign his appointment in Coward's academy, which was discontinued in the subsequent year. In 1786, attempts were made to establish a new academy in the vicinity of London, a design which Dr Kippis exerted all his influence to accomplish; and although his numerous engagements made it extremely difficult for him to fill any department in it, he reluctantly yielded to the wishes of the subscribers, and became a tutor. But the inconvenience arising from the distance of Hackney from his place of residence induced him to resign that office in a few years. His professional duties and private studies occupied his time after this period; and as he enjoyed an uninterrupted state of good health and constitutional vigour, his friends were led to hope that his life and usefulness would be long continued; but, in consequence of a cold which he caught on a journey, he was seized with a fever which no medical skill could subdue, and he died on the 5th of October 1795, in the seventy-first year of his age.

Dr Kippis was distinguished in a high degree for those virtues and accomplishments which are universally allowed to be the chief ornaments of human nature. His temper was mild and gentle, benevolent and candid; his manners and address were easy, polished, and conciliating. Notwithstanding his great reputation, he was void of pride, vanity, and self-conceit; on the contrary, he was humble, modest, affable, and engaging. The powers and vigour of his mind were far above mediocrity; he had a sound judgment, a comprehensive understanding, correct imagination, retentive memory, a refined taste, and he could exert his faculties on any subject with the utmost facility. He was an early riser from his youth, to which his good health may in a great measure be ascribed. He excelled in his acquaintance with the classics, belles-lettres, history, and biography. He was the steady friend and advocate of genuine civil and religious liberty; and, as a divine, he was well acquainted with the different branches of theology, and with those subjects which are subservient to the critical study of the Scriptures. He very seldom introduced controverted topics into the pulpit, but confined himself to such doctrines and duties as have an immediate influence upon the temper and practice.

Of his works, which are numerous and valuable, the following are the principal: 1. Review of the Transactions of the present Reign; 2. The History of Learning, Knowledge, and Taste, in Great Britain; 3. A Vindication of the Protestant Dissenting Ministers, with regard to their late application to Parliament; 4. Considerations on the Provisional Treaty with America, and the Preliminary Articles of Peace with France and Spain; 5. The Life of Sir John Pringle; 6. Six Discourses delivered at the Royal Society, on assigning the Copley Medal; 7. The Life of Captain James Cook, of Dr Lardner, and Dr Doddridge; 8. Sermons preached on public occasions; and, 9. the Biographia Britannica. This last great work, which he did not live to finish, has assigned him a high rank amongst the learned of his country, and will transmit his name with distinction to posterity.

KIRBY-LONSDALE, a town of the county of Westmoreland, in the ward of the same name, 251 miles from London. It is a neat town, in a pleasant valley, with a market, well supplied, on Wednesday. It is situated on the Lune, a river abounding with trout and other fish. The inhabitants amounted in 1801 to 1283, in 1811 to 1368, in 1821 to 1643, and in 1831 to 1686.

KIRBY-MOORSIDE, a town of the north riding of Yorkshire, in Rydall division, 278 miles from London, with a good market on Wednesday. It derives its name from its situation at the edge of Blackmoor. The inhabitants amounted in 1801 to 1396, in 1811 to 1673, in 1821 to 1878, and in 1831 to 1802.

KIRBY-STEPHEN, a town of the county of Westmoreland, in the east ward, 265 miles from London. It is situated on the western bank of the river Eden, and consists chiefly of one long street. It has some manufactures of hosiery, but little other trade. The market is held on Tuesday. The inhabitants amounted in 1801 to 1141, in 1811 to 1235, in 1821 to 1312, and in 1831 to 1409.

KIRCHER, ATHANASIUS, a Jesuit, and one of the most learned and laborious men that this celebrated order has ever produced, was born on the 2d of May 1602, at Geysen, a small town near Fulde in Germany. His parents were humble, but respectable, and exerted themselves to give him a good education. Having finished his studies, he entered the society of the Jesuits, where he found new means of satisfying his passion for learning, and applied himself to physics, natural history, mathematics, and ancient languages, embracing with equal ardour almost every department of knowledge. Being appointed to teach philosophy, and afterwards the oriental languages, in the college of Wurtzbourg, he acquitted himself of this double duty in the most satisfactory manner. But the Thirty Years' War, having interrupted his useful labours, and disturbed his repose, forced him to quit the country where he had already distinguished himself. He retired into France, and first settled in the Jesuits' College at Avignon, where he passed two years, entirely occupied with the study of antiquities. It was during his residence in this city that he became acquainted with the learned Peiresc, who advised him to attempt the explication of the Egyptian hieroglyphics; a task to which he afterwards applied himself with great zeal, though, unfortunately, with but indifferent success. Having received an appointment to the professorship of mathematics at Vienna, he was preparing to return to Germany, when he received an order to repair to Rome, whither he accordingly proceeded without delay. In 1637, the pope charged him to accompany Cardinal Frederick of Saxony to Malta, where he was received by the grand-master of the order of knights of St John and Jerusalem with much distinction. He next visited Sicily and the kingdom of Naples, and then proceeded to take possession of the chair of mathematics in the Roman College; a situation which he filled for eight years, at the end of which he obtained permission of his superiors to discontinue teaching in order to apply himself to other pursuits. He had a dispute with Father Maignan respecting the invention of an optical instrument; but though the affair made some noise, the question of priority remained undecided. Kircher died at Rome, on the 28th of November 1680, the same day on which Bernin and Grimaldi expired. He was a man of extraordinary but ill-digested erudition, without critical judgment. He was gifted with a strong imagination, vast memory, and indefatigable patience; but, notwithstanding his persevering application, he found himself unable to verify the facts stated in his works; and he had, besides, the folly to attempt to explain everything, by which means he fell into serious errors, and his fidelity was even brought into question. For an account of his fanciful and abortive efforts to penetrate the mystery of the Egyptian inscriptions, the reader is referred to the introductory section of the article HIEROGLYPHICS in this work. Several sovereigns, and amongst these Augustus duke of Brunswick, furnished him with the sums necessary for his experiments, and also transmitted to him rare and curious articles, with which he formed one of the most valuable cabinets which had yet been seen; whilst the most distinguished foreigners who visited Rome failed not to pay their respects to the learned Jesuit. The works of Kircher are very numerous, and would merit a detailed notice; but all that is consistent with the object of this notice of his life is merely to subjoin a list of the more important. They may be divided into three classes, according as they relate to the physical sciences and mathematics, languages and hieroglyphics, history and antiquities, not to mention some smaller productions of an ascetic character, which cannot be included under any of these heads. And they are as follow, viz. 1. Ars Magnetica, sive Conclusiones Experimentales de effectibus Magnetis, Wurtzbourg, 1631, in 4to; 2. Magnes sive de arte magnetica Opus tripartitum, Rome, 1641, in 4to; 3. Magneticum Naturæ regnum, sive Disceptatio physiologica de triplici in natura rerum magnete, Rome, 1667, in 4to; 4. Ars magna Lucis et Umbræ in x. libros digesta, Rome, 1645, 1646, in folio; 5. Misurgia universalis, sive ars magna consoni et dissoni in x. libros digesta, Rome, 1650, in two vols. folio; 6. Phonurgia nova de prodigiosis sonorum effectibus et sermocinatione per machinas sono animatas, Kempten, 1673, in folio; 7. Mundus Subterraneus, in quo universæ naturæ majestas et divitiæ demonstrantur, Amsterdam, 1664 or 1668, in two vols. folio; 8. KIRCHHEIM, a city of the kingdom of Wirtemburg, in the circle of the Danube, and the capital of a bailiwick

Kilow | Kirkcaldy. of its own name, which extends over seventy-eight square miles, and contains 25,200 inhabitants. The city is situated on the river Lauter, in a fruitful valley, has a respectable palace, 650 houses, and 4500 inhabitants, employed in making linen, woollen, and cotton goods, and other articles.

KIRILOW, a city of the province of Novogorod, in Russia, the capital of a circle of the same name, which extends over 579 square miles, containing two cities, 1280 villages and hamlets, inhabited by 52,870 persons. The city stands between two fresh-water lakes, and has 620 houses, with 2460 inhabitants. Long. 38. 29. E. Lat. 59. 42. N.

KIRKCALDY is a town in Fifeshire, about twelve miles from Edinburgh, lying along the margin of a bay, on the north side of the Frith of Forth. It consists chiefly of a very long and spacious street, well paved and lighted, in which there are many elegant houses and shops; also a few smaller streets and lanes, chiefly opening into the main street. To the west of the royalty, but within its boundary as fixed by the act 2 and 3 William IV. cap 65, are the populous villages of Linktown, in the parish of Abbotshill, and the village of West Bridge, in the parish of Kinghorn. In the year 1334, Kirkcaldy was mortified by David II. to the abbey of Dunfermline; and it was possessed by the abbey till the year 1450, when the commendator and monastery sold it, along with its harbour, to the bailies and inhabitants. On 5th February 1644 it acquired a charter of erection and novodamus as a royal burgh from King Charles II. By this charter he conveyed to the bailies, councillors, and community, the burgh, the harbour, and lands, the extent of which has been estimated at 487 acres. The amount of the revenue for the year ending 10th October 1835 was L.2320. 1s. 2d.; the ordinary expenditure, L.1263. 13s. $6\frac{8}{12}$d.; casual expenditure, L.24. 5s. The debts for the burgh then amounted to L.7040. 1s. $6\frac{1}{2}$d., and the effects were valued at L.1854. 18s. $3\frac{1}{2}$d. The government of the burgh is vested in a provost, two bailies, a dean of guild, and sixteen councillors, who are chosen under the act 3 and 4 William IV. cap. 76. There are also seven incorporated trades. The harbour, which is pretty safe, is situated near the east end of the town. In 1796 a basin or inner harbour was added to it; and of late years it has been very much deepened, and otherwise improved. The depth of the water at its entrance at spring tides is fifteen feet. Its basin is capable of containing fifteen sail of vessels of 350 tons and under. Its outer harbour, when the deepening operations at present (1836) in progress in it are completed, will contain considerably more. Though the harbour is the property of the town, yet, in terms of a statute passed in 1827, it is under the management of parliamentary commissioners, consisting of the provost, two bailies, dean of guild, and treasurer of the burgh, and the convener of the seven incorporated trades, three commissioners chosen by the prime guild or society of sailors, three by the merchants, and two by the county of Fife. By a decree-arbitral dated 5th March 1684, in a submission between the burghs of Kirkcaldy, Kinghorn, and Burntisland, the number of Kirkcaldy boats for transporting passengers and goods to and from Leith was limited to four. This decree was, on 20th December 1817, declared by the supreme court to be still in force; and the decision of the court further provided, that the four boats to be entitled to ply on the passage should be licensed by the magistrates and town council of Kirkcaldy. This decree-arbitral and decision of the court has had the effect of establishing a right of ferry in the town council of Kirkcaldy, which is now become one of the principal sources of the town's revenue. The ferry is at present navigated by two steamers belonging to the Kinghorn ferry-trustees, who hold licenses from the town council for that purpose. They make from two to three trips from the ferry stations, on each side of the firth, daily. About the commencement of the reign of Charles I. Kirkcaldy is said to have possessed 100 sail of vessels. Between the years 1644 and 1650, and shortly after, in the subsequent struggle with England, in less than ten years, ninety-six of its ships were said to have been taken at sea. In 1652, it appears, from Tucker's report, to have had twelve vessels, the burden of the whole of which was 582 tons. In the reports of the state of the royal burghs of Scotland made to the commissioners appointed by the general convention holden at Edinburgh, 9th July 1691, it appears that in 1692 the burden of the vessels then belonging to the port of Kirkcaldy was 1215 tons, and their estimated value was 45,200 merks. All these were then reported to be employed in carrying coals to Holland and London, except one or two, which might have freights from foreigners to the Sound or to Norway. There were also four ferry boats, of the value of 500 merks, each of which are stated to have been very unprofitable, since Kinghorn had built so many small boats, yawls, and great boats. In 1760 the trade of the port was so much depressed, that it then employed no more than one coaster of fifty, and two ferry boats each of thirty tons. The number of vessels in 1792 was twenty-six, the burden of which was 3700 tons register, and their value about L.30,000. The shipping belonging to the town in 1836 consists of seven vessels engaged in the whale fishery, eighteen in the foreign and general trade of the country, two smacks engaged in the London trade, two vessels in the trade to Newcastle, two in the Glasgow trade by the great canal, one in the Dundee trade, and two in the trade of Leith, besides two open boats. The burden of the whole amounts to about 6709 tons. There is at present a custom-house in Kirkcaldy, which includes under its superintendence all the ports from Aberdour on the west, to St Andrews on the east. On the 1st of January 1831 the burden of the whole of the vessels belonging to these ports amounted to 14,596 tons, and were navigated by 1289 seamen. There is a corn stock and sample market at Kirkcaldy, which is the most extensive in the county. It is held every Saturday, except on the third Saturday of February and July, and first Saturday of October, when it is held on the Friday preceding these days along with the horse and cattle market, which are fixed at these times. The trade of Kirkcaldy consists chiefly of flax-spinning, and weaving coarse linen goods, such as ticks, dowlas, checks, and sail-cloth, for home and foreign consumption. The value of the goods manufactured in 1815, when the trade was depressed, was estimated at L.125,981. It is now considerably increased. There are at present ten spinning-mills within the new limits of the burgh, turning upwards of 4895 spindles. There are also a rope-work, four bleachfields connected with the town for bleaching yarn, two tan-works, four salt-pans which used to make annually 15,000 bushels of salt before the salt-duties were repealed, a whisky distillery, two breweries for ale and porter, two iron founderies, and a colliery adjacent to the burgh, at which are raised annually 15,000 tons of coal. The banking business of the town is managed by branches of the Bank of Scotland, Glasgow Bank, Commercial Bank of Scotland, and National Bank of Scotland. There is a Chamber of Commerce, or association among the merchants, which was founded in 1825, for protecting the manufacturing interest, and for matters of general concern. There are a subscription library and a mechanics' library. The former, instituted about twenty-five years ago, now contains about 4000 volumes. There are also two news-rooms, maintained by public subscription. The public schools are maintained by the magistrates and council, and consist of a teacher of Latin and Greek, and a teacher of English and writing. The late Mr Philip, merchant in Kirkcaldy, who died in 1829, left from L.70,000 to L.80,000 for the purpose of educating and clothing a hundred orphan or destitute children in Kirkcaldy, a hundred and fifty in Pathhead, a hundred in Abbotshall, and fifty in Kinghorn. There is also another charity, arising from a fund left by the late John Thomson, post-master, partly for education, and partly for people in reduced circumstances. Besides the established church, there are two meeting-houses of the United Associate Synod, one of the Original Seceders, one of the Original Burgher Synod, one of the Independents, one of the Baptists, and one of the Episcopalians. The inhabitants of Kirkcaldy took a lively interest in all the civil and religious struggles under the house of Stuart. In 1622, when the general assembly of the protestant churches of France deputed Boesnage to solicit aid in this country, to enable them to resist the oppression of Louis XII. the town and parish contributed, by the king's permission, a pecuniary aid of 1030 merks, for which Boesnage's receipt is engrossed in the parish records. In 1645 Kirkcaldy sent so many men to contend with Montrose at Kilsyth, that his victory over them is said to have made 200 widows in the town alone. About the time of the revolution in 1688, the inhabitants contrived to apprehend the Earl of Perth, who was the lord chancellor under King James. They detained him five days under a guard of 300 men, and afterwards sent him, under a convoy of three boats and 200 men, to Alloa, where they delivered him over to the Earl of Mar. The most eminent native of Kirkcaldy was Dr Adam Smith, the author of the *Wealth of Nations*. The house in which he was born was taken down and rebuilt in 1835. Kirkcaldy unites with Dysart, Burntisland, and Kinghorn, in sending a member to parliament. In 1833 the constituency of these four burghs consisted of 502 voters, whereof there were enrolled in Kirkcaldy 314, in Dysart 105, in Burntisland 46, and in Kinghorn 37. Population in 1831, 5034.

KIRK, a Saxon term, signifying the same with church.

Kirk-*Sessions*, the name of a petty ecclesiastical judicatory in Scotland. Each parish, according to its extent, is divided into several districts, every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish, forms a kirk-session; and these meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, catechising, visitations, and the like. It judges in lesser matters of scandal, but greater, as adultery, are left to the presbytery; and in all cases an appeal lies from it to the presbytery. Kirk-sessions have likewise the care of the poor and poor's funds.

KIRCUDBRIGHT, a county in Scotland, situated between 54. 43. and 55. 19. north latitude, and 3. 33. and 4. 34. west longitude from Greenwich, is bounded on the north by the shires of Dumfries and Ayr, on the east and south by the Solway Frith and the Irish Sea, and on the west by the county of Wigtown. It derives its name from *Caer*, a fort, the Anglo-Saxons having erected a fort in honour of St Cuthbert, near the site of the present Kirkcudbright (originally *Caer Cuthbert*), the county town. It is in length from east to west about forty-eight miles, it varies in breadth from thirty to seventeen miles, and it contains 882½ square miles, or 564,480 English acres. This district is commonly called the *stewartry*, not the shire, of Kirkcudbright; and its judge, whose powers and duties are the same as those of a sheriff, is called a *steward*. The appellation of stewartry had its rise in the ancient tenure by which it was held, and the subsequent forfeiture of its lords; but the distinction between stewartry and sheriffdom is in this case purely nominal. Kirkcudbright is one of the two counties comprehended under the general name of Galloway, Wigtownshire on the west being the other.

About two thirds of the surface is mountainous. A range of mountains stretches along the whole northern boundary, in the form of a vast amphitheatre, embracing nearly half the county; on the boundary with Ayrshire they are not much inferior in height to any in the south of Scotland. There are also some considerable mountains on the southern extremity, such as Criffel, 1831 feet in height; Cairnsmore, 2597; and Cairnharrow, 1110. The high lands are for the most part covered with heath, except on a part of the northern boundary, where a narrow tract of green hills runs out between the counties of Ayr and Dumfries; and many of them are wet and mossy. In the middle of the district, the declivity is so gentle that the river Dee, at thirty miles from its mouth, is only 150 feet above the level of the sea; yet, even in the interior, there is no great extent of level ground, the greater part of the surface being occupied by rocky knolls, steep banks, and hills of a moderate elevation. On the coast, also, hills rise almost everywhere to the height of several hundred feet. The district is studded with a great number of lakes, of which there is one or more in almost every parish, though few of them are considerable. As there is not much full-grown wood, and the plantations are but partial, and for the most part not of many years' growth, the general appearance of the stewartry is that of a bleak, exposed country, on which labour has been but recently employed, and where its efforts must always be confined to a comparatively small field. Yet it contains many spots of great natural beauty, particularly on the coast, where the sea has in several places formed deep bays, surrounded with high grounds, some of which are fringed with coppice.

The soil of the lower grounds is, for the most part, of a hazel colour, sometimes inclining to red, and seems to be chiefly composed of argillaceous schistus in a state of decomposition. It is seldom of any great depth, and the rock, often rising above the surface, gives a rugged and sterile appearance to much even of the arable land. This soil is, however, in many instances possessed of great natural fertility, not soon injured by wet seasons, and affords plentiful crops and fine natural herbage. Clay is of no great extent, and found chiefly on the banks of the rivers. The smooth round hills accessible to the plough have, for the most part, a close subsoil, here called *till*, and do not, therefore, admit of being profitably cultivated but after an interval of several years pasturage. Tracts of moss, commonly from four to eight feet deep, extend over a tenth or twelfth part of the whole county.

Much of the mountainous district is composed of granite. According to the *Agricultural Survey*, there are three several districts of this rock, which occupy nearly a fourth of the surface. Strata of very dissimilar substances, to which Dr Hutton has given the general name of schistus, prevail in the lower parts. Some are of a hard, compact grain, of a blue or grayish-brown colour, for the most part breaking irregularly, but often in parallel plates, of which coarse slates have been made. With these are intermixed layers of a soft argillaceous stone, which readily yields to the weather, and is popularly known by the name of *slate band*. These rocks, which also occupy a large part of the district, are sometimes traversed by dykes of porphyry, and also by granite. In the neighbourhood of Dumfries the prevailing rock is sandstone. Limestone is found at Kirkbean, on the Nith, the only place in the county where it is wrought; and there are also some promising indications of coal on the estate of Arbigland, near Dumfries. In the parish of Colvend, on the Solway Frith, there is a quarry which affords millstones. Lead mines were wrought in Minnigaff, on the western boundary, for many years, but have been discontinued. Iron ore abounds, but, from the want of coal and wood, it is of little value. On the estate of Mr Murray of Broughton, near Gatehouse, copper has lately been discovered, and is now being wrought by an English company.

The rivers are, the Nith, which separates this county from Dumfriesshire for about nine miles on the north-east; the Urr, which flows south-east by the village of Dalbeattie, and is navigable five or six miles for small vessels; the Dee, the largest river, which enters Loch Ken, a lake almost in the centre of the county, about eight miles in length, and in some places a mile in breadth, and, giving its name to the river which issues from the lake, falls into the Solway Frith about five miles below the town of Kirkcudbright. It is navigable for two miles above this town for vessels of 200 tons. In spring-tides the water rises about thirty feet at Kirkcudbright, where there is a well-sheltered natural harbour, of easy access. For the last seven or eight miles of its course the banks of the Dee are planted. St Mary's Isle, near Kirkcudbright, is a highly ornamented spot; and the Little Ross, a beautiful island, is situated at its mouth. There are other small islands, as those of Fleet, Knockbrex, and Heston, scattered along the coast. The salmon fishery on this river was rented, some years ago, at L.900. The Fleet is remarkable for the picturesque scenery on its banks; but, as its stream is circuitous, and it often changes its course, a canal of about a mile in length has been cut, at the sole expense of Mr Murray of Broughton, by means of which the navigation to Gatehouse, a village about four miles from the sea, has been rendered easy. The Cree, a more considerable river, separates this county from Wigtonshire, and flows into the bay of Wigton, from whence it is navigable to the small harbour of Carty, a little below Newton-Stewart. The stewartry is everywhere supplied with pure springs and rivulets. Chalybeate springs are also numerous, one of which, Lochenbreck, in the parish of Balmaghie, seven miles from Gatehouse, is said not to be inferior in medicinal virtues to any in the kingdom.

The landed property is not divided into large estates. Out of 1043, their number in 1808, as given in the *Agricultural Survey*, 972 are stated to have been below L.500 a year. The valued rent, which was taken in 1642, is L.114,637. 2s. Scots; the real rent, in 1808, was estimated at L.167,125 sterling, and in 1831 at L.213,308. Many of the smaller proprietors cultivate their own estates. According to the work just referred to, almost half the county is held under deeds of entail, many of which have been executed very lately. "The condition of the peasantry, at a period not very remote, seems to have been much depressed, and the state of husbandry rude and barbarous in the extreme." (Smith's *Survey*.) Referring to the year 1720, John Maxwell of Munshes observes that "the tenants in general lived very meanly, on kail, groats, milk, graddon ground in querns turned by the hand, and the grain dried in a pot, together with a crock ewe now and then about Martinmas. They were clothed very plainly, and their habitations were most uncomfortable. Their general wear was of cloth made of waulked plaiding, black and white wool mixed, very coarse, and the cloth rarely dyed. Their hose were made of white plaiding cloth, sewed together, with single-soled shoes, and a black or blue bonnet, none having hats but the lairds.......In 1725 potatoes were first introduced into this stewartry by William Hyland, from Ireland, who carried them on horses' backs to Edinburgh, where he sold them by pounds and ounces. During these times, when potatoes were not generally used in this country, there was for the most part a great want of food, bordering on famine; for, in the stewartry of Kirkcudbright, there was not as much victual produced as was necessary for supplying the inhabitants. The produce of the country in general was gray corn; and you might have travelled from Dumfries to Kirkcudbright, which is twenty-seven miles, without seeing any other grain, except in a gentleman's croft, which in general produced bear or big for one third part, another third in white oats, and the remaining third in gray oats. At that period there was no wheat raised in the country; what was used was brought from Teviot, and it was believed that the soil would not produce wheat. In the year 1735 there was no mill for grinding that sort of grain; and the first flour mill that was constructed within these bounds was built at Clouden, in the parish of Irongray, some years after that date." (Murray's *Literary History of Galloway*, 2d edition, 1832, pp. 337–9.) Yet it was in this county that the improvements of modern husbandry were adopted, at a time when they were entirely unknown in the greater part of the kingdom. As early as the year 1750, Mr Craik of Arbigland practised the drilling and horse-hoeing of the celebrated Tull, which he ever afterwards continued to follow in the culture of beans and turnips. He enclosed and drained his estate, cleaned his fields by fallowing, applied calcareous manures, introduced sown grasses into his course of crops, and worked his plough with two horses. A few of the other proprietors followed in his steps, but their efforts were not seconded by the tenantry at large. It is only since the end of last century that modern husbandry has made any considerable progress, but it is now quite general. The chief crops are oats and barley, with wheat on the better soils.

A great impetus has lately been communicated to agriculture in this county, by the regular and cheap communication with Liverpool by means of steam-navigation. The farmers have thus a ready outlet for their disposable produce, corn, cattle, and sheep, and receive cash payments. Instead of being, as formerly, far from a market, and forced in consequence to sell to corn-dealers, a class of men with whom bankruptcy was any thing but uncommon, the farmers are now, as it were, placed in the very vicinity of the best market, and are freed from all risk of non-payment. By these favourable circumstances, a spirit of improvement and enterprise has been roused, which promises, ere long, to change the face and character of the county. Nothing, indeed, has ever effected so important a change in the circumstances of this county, as the introduction of steam-navigation. The first steam-boat seen on its shores was in 1830; and there are now three that ply regularly between it and the English coast, particularly Whitehaven and Liverpool. Their decks are covered with sheep and black cattle, whilst their holds are filled with corn. Nor is this all. These vessels have opened up channels of industry before quite unknown. Poultry, eggs, and butter, by being sent to the ready market of England, form a new and pretty productive source of income. Salmon, instead of being sent as formerly round to England by the expensive mail-carriage, is now transmitted thither by steam more directly, and at much less expense; whilst commodities required from England are obtained under the most favourable circumstances.

Unlike other hilly tracts in Scotland, the land is almost universally enclosed, chiefly with stone walls, called *Galloway Dykes*. These dykes are built close, or double as it is called, for part of their height, and afterwards single, the stones in the latter part being laid in such a manner as to allow the passage of the light through the wall. But it is now becoming a common practice to build the whole of the wall double, and, after laying a course of stones that project a little beyond its breadth on both sides, it is completed by a coping of stones laid on edge, and closely pinned.

This county is chiefly celebrated for its cattle, which form by far the most important part of its agricultural produce. They are known in every part of Britain by the name of *Galloway cattle.* (See AGRICULTURE.) Sheep are confined to the mountainous districts, where they are kept in great numbers. They are of the heath or black-faced variety, with coarse wool, and yield a very small return for the extent of their pastures, which, however, are in general of the very worst description in the south of Scotland, some large tracts being rented so low as 6d. an acre, or even lower. It is now becoming the practice to combine the rearing and fattening of sheep with the culture of arable land, by which the light soils of the other border counties have been rendered so productive. A small, hardy, and active race of horses, called *Galloways*, was formerly reared here and in Wigtonshire, the other division of Galloway; but a larger breed being required for the labours of modern husbandry, especially since two-horse ploughs have become general, the old race is very rarely to be found in a pure state. The name, however, is frequently applied to horses below full size, wherever they may have been reared.

The first road act for the stewartry of Kirkcudbright was obtained in 1779. At that period there was scarcely any thing that deserved the name of a road, except the military road from Dumfries to Portpatrick, which had been made about fifteen years before; but at present very few districts are better provided in this respect. The first good roads were made on the estate of the Earl of Selkirk, under the direction of his son Basil William Lord Daer, to whom this county owes many other improvements. In 1796, by another act of parliament, the assessments were allowed to be increased, and tolls erected; and soon afterwards a new road was made from Dumfries to Castle-Douglas, a distance of eighteen miles, through a hilly, broken country, with so much attention to preserve the level, that it has seldom a rise of more than one foot in forty, and much of it is nearly a perfect level. All the principal roads made since have been done with equal judgment. The turnpike roads, in 1834, extended to 216 miles; and the annual income obtained from tolls amounted to L.2557. The district is also well accommodated with bridges, of which the most considerable is one over the Dee at Tongland, about two miles above Kirkcudbright, which has an arch of 110 feet span. It is built of sandstone, brought partly from Annan in Dumfriesshire, and partly from the Isle of Arran. It was finished in 1808, and cost upwards of L.7000.

Kirkcudbright, the county town, which was erected into a royal burgh in 1455, contained, in 1831, a population of 3511. It is pleasantly situated on the Dee, and is noted for the information and urbanity of its inhabitants. Societies have been formed here for a purpose rather unusual, namely, the building of houses, not for sale, but for the use of the members who compose them. Every member makes a small monthly payment into a general fund, which is employed in erecting the houses, and these, as they are finished, are assigned to the members by lot, those to whom they fall paying five per cent. on the money which their houses have cost, in addition to their monthly payments; and this arrangement continues till all the members are supplied, and the societies dissolved. New Galloway, which was erected into a royal burgh in 1633, is situated at the head of Loch Ken, and contains only about 400 inhabitants. The principal villages are Creetown, at the mouth of the river Cree, on the bay of Wigtown; Gatehouse, twelve miles east from the former, on the river Fleet; and Castle-Douglas, formerly called Carlinwark, an inland place, about nine miles north-east of Kirkcudbright. The Galloway Bank, now discontinued, was established at Castle-Douglas in June 1806. A branch of the Bank of Scotland had been introduced into the burgh of Kirkcudbright about twenty years previously. These three villages seem to be in a thriving state; the houses are for the most part of two stories, and, in other respects, they are superior to villages of the same extent in many other parts of Scotland. The others are Dalbeattie on the river Urr; Keltonhill, noted for its great cattle fairs in June and November; and Maxwellton, on the Nith, which, though in this county, belongs by its situation to the town of Dumfries, from which it is separated only by the bridge over that river. By the reform act, indeed, it is included within the parliamentary boundaries of that town.

There are no regular assessments for the poor in the country parishes, but the ordinary kirk-session funds have been much augmented in some parishes by charitable donations. In some instances voluntary assessments upon the part of the heritors take place, particularly in unfavourable seasons.

The inhabitants of the stewartry have few traits of character peculiar to themselves. Living remote from the capital, or any large town, they are a simple, unsophisticated people, feudal and superstitious in their sentiments. A belief in witchcraft, and in the more popular superstitions, still obtains. They think no character superior to the minister or the laird. These peculiarities, however, are beginning to give way. Education has attained a most respectable footing; and the collision of sentiment which the people experience by the intercourse now opened up by the facilities of communication with strangers has had a most salutary and liberalizing influence. They are an enterprising people. They send, on an average of the last ten years, about forty young men to the university yearly; and the number of those who annually cross over to England to push their fortune, or emigrate either to our own colonies or to foreign states, is extremely great. Of these, not a few, after experiencing success in life, return to their native country with a respectable competency; and thus, by their example, stimulate others to follow their steps. Of the extent to which emigration from this county is carried, a correct estimate may be formed from the fact that, though the number of males born is about five per cent. above that of females, the latter in the stewartry exceed the former by 2642. A great number of Irish, of the lowest grade, are settled here.

Education, as mentioned above, is in a respectable state. Some of the schools are excellent; few of them are bad; and when a vacancy now takes place, the utmost pains are taken to get the best teacher to fill it. Several sums have been bequeathed by individuals for the support of schools, particularly in the parishes of Balmaclellan, Dalry, and Borgue. In addition to the parish schools, there are many voluntary seminaries, which are in a highly respectable and efficient state.

It has already been mentioned that the people are distinguished for their religious character. The reformation began here at a peculiarly early date, namely, the begining of the fifteenth century (*Literary History of Galloway*, p. 61), and some of the most eminent reformers and covenanters were connected with this county. The persecution in the times of Charles I. and his son Charles II. raged most hotly here. The graves of martyrs are to be found, not only in almost every churchyard, but even in many of the wildest moors. Presbyterianism still continues predominant. In addition to the twenty-eight parish churches, there are one chapel of Ease at Maxwellton; one church of the Cameronian persuasion at Urr; and six of the United Associate Synod at Urr, Castle-Douglas, Dalry, Kirkcudbright, Creetown, and House of the Hill. There is no Episcopalian chapel, but there are two belonging to the Roman Catholics, one at New Abbey and another at Dalbeattie; and one Independent meeting-house at Gatehouse.

The stewartry could boast of a greater number of monasteries than any other county in Scotland. These were, Dundrennan, St Mary's Isle, and Tongland, founded in the twelfth century, by Fergus, lord of Galloway; Lincluden, by his son Uchtred; and Sweetheart, or New Abbey, founded in the thirteenth century, by Dervorgille, daughter of Alan, last lord of Galloway, and mother of John Baliol, the competitor for the throne. Of the three first of these buildings, the remains are comparatively entire; of the other two, all vestiges have disappeared.

The bishopric of Galloway, both in Catholic and in Protestant times, comprehended the stewartry and Wigtonshire. It formed the most ancient see in Scotland; and in dignity was inferior only to the archbishopric of St Andrews and Glasgow, till in 1633, when Edinburgh was erected into a bishopric, and obtained the preference over Galloway. The bishops of Galloway were *ex officio* deans of the chapel royal of Stirling.

Some very eminent men have been connected with the stewartry as monks or bishops, such as David Panther of St Mary's Isle, afterwards bishop of Ross; William Melville of Tongland, afterwards a lord of session, under the title of Lord Tongland; Gilbert Brown of Sweetheart, well known as the author of a small but learned work against the famous John Welsh, minister of Kirkcudbright; and the following bishops of Galloway, Alexander Gordon (known in history as archbishop of Athens); William Cowper, an eminent and learned theological writer; and Thomas Sydserff. Nor in more modern times has this county been less distinguished for eminent literary characters. Robert Maxwell, author of *The Practical Husbandman*, and several other excellent works on agriculture; Thomas Gordon, the translator of *Tacitus*, and author of *The Independent Whig*, and other works; Robert Heron, author of a *History of Scotland* in six volumes, and numerous other publications; Dr Alexander Murray, the celebrated linguist; Dr Thomas Brown; Thomas earl of Selkirk, author of an able work on emigration; not to mention many others, such as John Welsh and Samuel Rutherford, who were connected with this district by office and residence. In 1835 a monument to the memory of the late Dr Alexander Murray was erected near the place of his birth, in the parish of Minnigaff. The funds (L.450) were raised by subscription; the height of the pillar is eighty feet.

The occupations of the people, according to the population returns in 1831, were as follows:

Occupiers of land employing labourers	871
Occupiers of land not employing labourers	490
Labourers employed in agriculture	2648
Employed in manufactures	529
Employed in retail trade and handicraft	2299
Capitalists, bankers, &c	440
Labourers not agricultural	1076
Other males twenty years of age	805
Male servants	108
Female servants	2378

The county, as is evident from this table, is not remarkable for manufactures; but it contains a larger number of men employed as weavers than home consumption would require. They weave to a limited extent for the Glasgow, Paisley, and Kilmarnock markets. The number of weavers was altogether above 500. But since 1831 the cotton mills at Gatehouse have been revived under the best management, and in this way perhaps 200 more are added to the manufacturing class. There are also stocking-makers, cloggers, and nailers. The chief exports of the county are the produce of the soil; grain, black cattle, sheep, and wool; the chief imports are coals, lime, groceries, timber, iron, and slate.

It has already been stated, that the mountainous districts of the stewartry are composed of granite. A granite quarry was opened in 1830, on the estate of Cassencarrie, in the parish of Kirkmabreck, by the Liverpool Dock Company. This is at present the most important work of the kind carried on in Scotland. About 300 workmen are daily employed in it; machinery of a kind previously unknown in Galloway has been introduced; a railway has been constructed connecting the quarry with Wigton Bay, a distance of about half a mile; and a new harbour has been built at the expense of the company, the vessels belonging to which transport the stone from thence to Liverpool. Besides defraying surface damage for the line of the railway, the company pay to the landlord a sum proportional to the produce of the quarry; and thus a piece of land, which was previously covered with rock and heath, and literally worth nothing, certainly not twenty shillings, now realizes an annual rent of about L.400.

The following table contains the abstract of the population at different times.

YEARS.	HOUSES.			OCCUPATIONS.			PERSONS.		
	Inhabited.	By how many Families occupied.	Uninhabited.	Families chiefly employed in Agriculture.	Families chiefly employed in Trade, Manufactures, or Handicraft.	All other Families not comprised in the two preceding classes.	Males.	Females.	Total of Persons.
1811	6223	7380	196	2662	1885	2833	15,788	17,896	33,684
1821	6441	7912	190	3047	2238	2627	18,506	20,397	38,903
1831	6604	8283	146	2826	2293	3164	18,969	21,621	40,590

The stewartry sends one member to parliament, the constituency in 1835 amounting to 1166. In the election for the burghs, Kirkcudbright (which contains 111 electors) joins with Dumfries, Sanquhar, Annan, and Lochmaben; and New Galloway (which contains sixteen electors) with Wigton, Stranraer, and Whithorn. It is divided into twenty-eight parishes, of which sixteen belong to the presbytery of Kirkcudbright, and two to that of Wigton, both in the synod of Galloway, and ten to the presbytery and synod of Dumfries.

See *Bauties of Scotland;* Murray's *Literary History of Galloway*, 2d edition, 1832; Smith's *Agricultural Survey*, 1810; *The General Report of Scotland;* Playfair's *Account of Scotland;* and Chalmers's *Caledonia*. But the greater part of this article is derived from personal knowledge and private documents.

KIRKHAM, a town of the county of Lancaster, in the hundred of Amounderness, 226 miles from London. It is near the river Ribble, and has a way across the sands and that river, which requires a guide, to Tarleton, a distance of three miles. There is a market on Thursday; and some sail-cloth manufactories are carried on. The inhabitants amounted in 1801 to 1561, in 1811 to 2214, in 1821 to 2735, and in 1831 to 2469.

KIRKKILLISSA, or KIRKLEESON, a city of Turkey in Europe, the capital of a circle of the same name, in the province of Rumili, about eighty miles from Constantinople, on the road to Silistria. It is surrounded with old walls, is defended by a citadel, and contains a bazar, several mosques, churches, and baths, and about 1600 inhabitants, amongst whom are many Jews, and some Greeks. Though the country around it is stony, it produces abundance of grapes, melons, and other fruits; and much wine is made. Long. 16. 55. E. Lat. 41. 50. N.

KIRMAN, or KERMAN, a province of Persia, is bounded on the east by a part of Seistan and Beloochistan, west by the province of Fars, south by Laristan, Mukran, and the Persian Gulf, and north by Irak and Khorassan. It has been in all ages partitioned into the habitable and desert regions; the former extending, in extreme length, from Regan, in Nurmansheer, to Robat, on the boundary of Fars, about 305 miles, and in breadth, from the southern limit of Irak to the town of Gombaroon or Bunder Abass, on the shore of the Persian Gulf, about 280 miles in a direct line.

Even the soil of this habitable tract is in many places unprolific, and the face of the country barren and waste. There is not a river in the province, the few streams that occur being merely mountain torrents swelled by the rains, and dry during the remainder of the year; and were it not for a few springs in the mountainous districts, and the karezes or under-ground aqueducts (a singular contrivance, common in Persia, by which water is conducted, by means of pits from thirty to ninety feet deep, and about 100 paces apart, and connected by a common trench, sometimes a distance of thirty or forty miles), the inhabitants could not possibly exist. In this manner water is procured with extraordinary pains and attention, and withal not more than sufficient to cultivate a very trifling portion of the soil. The only exception to this description is the district of Nurmansheer; but, even here, the abundant supplies of water, once so common, have much decreased within the last twenty years; and Lieutenant Pottinger, in travelling through this country, concluded, from the vast tracts of desolate plains which are encountered in travelling across the country from the east towards Kirman, that the desert was fast encroaching on the regions of cultivation.

The country is, generally speaking, mountainous. The principal range of mountains is that which divides Nurmansheer from Laristan, and thence, running in a south-westerly direction, approaches within four days of Gombaroon. Here, running along the coast to the west and north-west, it joins the mountains of Fars, in latitude 29. 40. N. and longitude 54. E. In its course it throws out numerous ramifications, both to the northward and southward. So entirely do these hills intersect the country, that the plains which they separate seldom exceed ten or twelve miles in breadth, though often of an indefinite length. The climate of the province varies of course with the inequality of the ground. Snow lies to a great depth on the mountains in winter, and, from their loftiness, it does not melt for the greater part of the year; so that the people in the plains are frequently seen panting from extreme heat, whilst it is freezing in the adjacent mountains. The cold mountain air also is far from salubrious, as it brings along with it agues, fevers, and other diseases; so that the natives prefer the most sultry weather.

To the southward of the great chain of mountains, and between their base and the sea, lies the Gurmseer, or hot country, which is a narrow strip, varying from thirty to ten leagues in breadth, and extending all along the sea-coast of Persia, from Meenab, the capital of Laristan, to the mouth of the Shatool-Arab or Bussorah River. The portion of this tract that lies within the limits of Kirman is almost solely composed of saline sand; it produces nothing but dates of a very inferior quality, and the climate is peculiarly unhealthy.

The desert region of Kirman extends 270 miles in length, from the northern boundary of Nurmansheer, in latitude 29. 30. north, to the mountains of Khorassan, in latitude 34. north; and in breadth 200 miles, from the city of Yezd, in longitude 55. 40. east, to a range of mountains separating it from Seistan, in 60° east. The whole of this tract is a salt desert, and so decidedly barren, that it does not even produce grass, or any other vegetation, for eighty or ninety miles at a stretch; nor is there a drop of water. The Afghan army, on its march to invade Persia in 1719, lost one third of its numbers in this desert. There is a path from Kirman to Herat in Khorassan, by which couriers can travel in eighteen days; but the risk is so great that a high sum is always demanded for such a journey.

This province is famous for very fine wool, produced by great flocks of sheep and goats, which are fed on the mountains, cold in winter, and hot and arid in summer. Not only is the wool of the sheep of very fine quality, but the goats produce a down that grows in winter at the roots of the hair, in the same manner as that of the Thibet and shawl goats, and nearly as fine. This is spun into various fabrics, which almost vie with the celebrated shawls of Cashmere in fineness and beauty of manufacture. From the wool of the sheep are made shawls, numuds, and felts, which are celebrated all over Asia. The wool is prepared in a peculiar manner, being immersed in a wash, the ingredients of which are known only to the makers. The Kirmanees are also famed for the manufacture of matchlocks. These they send to Khorassan, Cabul, Balkh, Buckharia, and the northern provinces; and in return receive assafœtida, gums, rhubarb, madder, and other drugs; Buckharia skins, furs, silk, steel, copper, and tin (the last three articles are for home consumption; they export the remainder to India, Sinde, Arabia, and the Red Sea); pistachio nuts, rose leaves and buds for making conserve, gums, cotton, carpets, and buttons. They import from India tin, lead, iron, copper, steel, pepper, and all other spices; chintz both European and Indian, indigo, muslin, tea, satin, gold, flowered silks, gold-cloth, cocoa-nuts, china and glass-ware, broad cloth, &c. From Sinde they receive white cloth and coloured stuffs for turbans; and from Arabia and the Red Sea coffee, gold-dust, ivory, musk, frankincense, stones, &c.

KIRMAN, or *Kerman*, called also sometimes Sirjian, a large city, and capital of the above province, situated on the western side of a capacious plain, so close to the mountains, that two of them, on which there are ancient forts, completely command it. It was in early times one of the most flourishing cities in Persia, and was inferior to none in size except the capital, Ispahan. It became, by its situation in the direct road from Khorassan, Balkh, Buckharia, the countries beyond the Oxus, and all the northern part of the Persian empire, to the sea-port of Bunder-Abass, a great emporium of eastern commerce, and the centre of wealth, learning, and magnificence. The date of its foundation is not ascertained, but Lieutenant Pottinger states, on the authority of a manuscript history of the conquest in the 90th year of the hejira, or about the 700th year of the Christian era, that Kirman was then a very extensive city, full of riches, and celebrated for the excellence of the shawls and arms made in it; and he imagines that its foundation is coeval with the renowned city of Ormuz. No city has been subject to greater reverses of fortune, or oftener the scene of severe, destructive wars, both foreign and domestic, than Kirman. It has been successively taken and plundered by the caliphs, by Ghengis Khan, Tamerlane, the Afghans, and Nadir Shah: in addition to all that, it has suffered from civil broils, in the course of which it has often been taken by storm. The last event of this kind took place in the year 1794, when it was betrayed into the hands of Agha Mahommed Khan, uncle of the present king, and founder of the Kajjar dynasty, who had besieged it in vain for several months. Under this eastern barbarian the city was given up for three months to incessant ravages by a licentious soldiery. All its fortifications and elegant structures, which were raised by the Afghans, were razed to the ground; and the cruel conqueror, after sacrificing to his revenge every person of whom he had the slightest suspicion, carried 30,000 of the inhabitants into slavery, or exiled them to the distant provinces of Mazunderan and Azerbijan. After this dreadful calamity, the city lay desolate for some years after the accession of the present king, who directed the fortifications to be rebuilt on a reduced scale. They are still, however, large, and consist of a high mud wall, with nineteen bastions, and a dry ditch twenty yards wide and ten deep. The works are entirely encompassed by ruins. There are four gates, and the ark or the citadel, in which the governor's palace is built, and which is on the southern face of the fort, is defended by similar works. The bazar is well supplied with articles of every description, and from every nation: one part of it is covered in with very elegant domes, built of a beautiful blue stone, dug from quarries in the adjacent mountains. There are eight or nine caravanserais within the walls, besides many inferior ones outside. Kirman contains 30,000 inhabitants, consisting of Armenians, Hindus, or Jews, resident in the place, and of a small proportion of Guebres or Parsees. The trade of the town, though considerable, has never revived to its former extent; and it is not likely that it will again do so, as the great resort of merchants is now to the sea-port town of Bushire, farther up the Gulf of Persia, to the prejudice of Bunder-Abass, and of course of Kirman, of which Bunder-Abass is the port. Its manufactures of shawls, matchlocks, and numuds or felts, are celebrated all over Asia, and are said to afford employment to upwards of one third of the inhabitants, whether male or female. The former are made from the famous wool already described, and rival those of Cashmere in delicacy of fabric and texture, though they are not equal in downy softness and warmth. The revenues of the city, which in 1810 amounted to L.25,000 per annum, and are said to be rapidly increasing, are employed by the prince in maintaining his court, and a body of troops for the protection of the city and neighbourhood from the incursions of the wild predatory tribes of the mountains. These duties arise from a heavy tax on shawls and matchlocks. Camels, horses, &c. which enter any caravanserai in the city, are charged each one rupee. Long. 56. 6. E. Lat. 29. 56. N.

KIRKWALL, the chief town in the Orkney Islands, is situated in long. 3. 23. 6. W. and in lat. 58. 59. 31. N. It consists principally of one crooked, narrow street, about a mile in length. The number of inhabitants in the town and adjoining parish was by the last census 3721. There are four places of worship in the parish, the established church, the United Secession meeting-house, a congregation in connection with the Associate Synod of Original Seceders, and a congregation of Independents. There are ten schools in Kirkwall, attended by 422 scholars; of these, seventy-one are learning Latin, and twelve mathematics. The entire population between the ages of six and twenty are able to read, and in the parish there are only ten or twelve persons unable to read. There are from ninety to a hundred persons on the poor's roll, who are relieved by the contributions made at the church door, which average about L.50 a year. The trade of Kirkwall, in relation to the population, is considerable. For the year ending 31st December 1834, the amount of tonnage of vessels cleared outwards, coastwise and foreign, was 8248; and, for the same period, the amount of tonnage inwards was 10,304. There were in December 1835 seventy-eight registered vessels belonging to the port, with a tonnage of 4238, and navigated by 326 seamen. The custom-house duties on goods imported from December 1833 to December 1834 amounted to L.1148; there were no export duties. The principal imports are wood, hemp, iron, tar, groceries, coals, cloths; and the exports consist chiefly of kelp, fish, corn, cattle, and wool. It has been found impossible to give any thing at all approaching to the correct value of the articles imported and exported, as there is no record of these kept. The principal buildings in Kirkwall are the cathedral of St Magnus, the choir of which is still occupied as the parish church; the earl's palace; and that which formerly belonged to the bishops of Orkney. St Magnus's Church was founded by Ronald, count of Orkney, about the middle of the twelfth century. It is in the form of a cross; its length is 225 feet, and its breadth fifty-six; the roof is seventy-one feet from the floor, and the spire rises about seventy feet higher. The roof is supported in all by thirty-two pillars, of which the four that support the central tower are twenty-four feet in circumference. The earl's palace was commenced about 230 years ago, by Patrick earl of Orkney, and, though now in ruins, its remains show that it must have been a strong and magnificent edifice. The large hall is sixty feet long by twenty broad, and is lighted by four spacious windows. The bishop's palace is almost an entire ruin, the only part that remains in any thing like preservation being a round tower erected by Bishop Reid, a statue of whom still occupies a niche fronting the cathedral. In this palace Haco king of Norway died on his return to Orkney, after the unsuccessful battle of Largs in 1263. The remains of an old building, the castle of Kirkwall, erected in the fourteenth century, by Henry St Clair, the first earl of that name, are still to be seen; and the antiquary will be gratified to learn that the house in which James V. passed the night during his visit to Orkney in 1540 is yet in existence. Kirkwall is the seat of the sheriff, commissary, and justice of peace courts. It is a royal burgh, and, along with Wick, Dingwall, Tain, Cromarty, and Dornoch, returns a member to parliament. There are fifty-eight voters in the town.

KIRSTENSIUS, Peter, professor of physic at Upsal, and physician extraordinary to the queen of Sweden, was born at Breslau in 1577. He studied Greek, Latin, Hebrew, Syriac, natural philosophy, anatomy, botany, and other sciences. Being told that a man could not distinguish himself in physic unless he understood Avicenna, he applied himself to the study of Arabic; and qualified himself not only to read Avicenna, but also Mesue, Rhasis, Abenzoar, Abukasis, and Averroes. He visited Spain, Italy, England, and did not return home from his travels till after seven years. He was chosen by the magistrates of Breslau to take the direction of their college and of their schools. A fit of sickness having obliged him to resign that difficult employment, with which he was also much disgusted, he applied himself chiefly to the practice of physic, and went with his family into Prussia. Here he obtained the friendship and esteem of the chancellor Oxenstiern, whom he accompanied into Sweden, where he was made professor of physic in the university of Upsal, and physician to the queen. He died in 1640. It is said in his epitaph, that he understood twenty-six languages. He wrote many works, amongst which are, 1. Liber secundus Canonis Avicennæ, typis Arabicis, ex manuscriptis editus, et ad verbum in Latinum translatus, in folio; 2. De vero usu et abusu Medicinæ; 3. Grammatica Arabica, folio; 4. Vitæ quatuor Evangelistarum, ex antiquissimo codice manuscripto Arabico erutæ, in folio; 5. Notæ in Evangelium S. Matthæi, ex collatione textuum Arabicorum, Syriacorum, Egyptiacorum, Græcorum, et Latinorum, in folio. He ought not to be confounded with *George Kerstenius*, another learned physician and naturalist, who was born at Stettin, died in the year 1660, and is also the author of several works.

KIRTHIPOOR, a town of Hindustan, in the province of Nepaul, and district of Patan. It was formerly the capital of an independent principality, and was at one time said to contain 6000 houses or families within its jurisdiction; but is at present of little consideration. This place was besieged by Purthi Narrain, the Ghoorkali rajah, and taken, in 1768, after a long and obstinate resistance, at which he was so enraged that he ordered the noses and lips of the survivors to be cut off, without exception of age or sex; and, twenty-three years afterwards, the British ambassador at Nepaul found many persons who had outlived this mutilation. It is three miles from Patan. Long. 85. 37. E. Lat. 27. 30. N.

KIRTLE, a term used for a short jacket, as "the flowery-*kirtled* Naiads;" also for a quantity of flax, about a hundredweight.

KIRWAN, Richard, a celebrated chemist, born in the county of Galway, in Ireland. He was originally destined to the study of the law, and, having been called to the bar, followed the profession of advocate, until some circumstances obliged him to quit it; whereupon he applied himself to the study of the natural sciences, to which his taste had always inclined him. Having established himself in London or its neighbourhood, about the year 1779, he read, at the sittings of the Royal Society of which he had become a member, several memoirs, for which, in 1781, the Copley medal was adjudged to him. Having returned to his native country about the year 1789, he was some time afterwards elected president of the Royal Irish Academy, and published several works, not only on chemistry, geology, and mineralogy, but also on metaphysics and logic. He was likewise president of the Dublin Society, and a member of the principal literary and scientific associations in Europe. He died on the 22d of June 1812, at a very advanced age. Kirwan was regarded as the Nestor of the British chemists, and almost all the natural sciences have been more or less indebted to his long labours. His works are, 1. Experiments and Observations on the Specific Gravities and Attractive Powers of various Saline Substances, published in the Philosophical Transactions; 2. Elements of Mineralogy, 1784, in two vols. 8vo, translated into German by Crell; 3. An Essay on Phlogiston and the Constitution of Acids, 1787; 4. An Estimate of the Temperature of Different Latitudes, 1787, in 8vo; 5. A Treatise on the Analysis of Mineral Waters, 8vo; 6. Logic, 1789, in two vols. 8vo; to which may be added, various communications to the learned societies of which he was a member. At Dublin he formed an association for the express purpose of cultivating mineralogy; and, as a geologist, he distinguished himself by advocating what has since been called the Neptunian theory of the earth, in opposition to that of Dr Hutton. (A.)

Kirwan, *Walter Blake*, a celebrated Irish preacher, was born in the county of Galway about the year 1754. He was descended of an ancient family of the Roman Catholic persuasion, and, in early youth, went to the college of the English Jesuits at St Omer, where he received the rudiments of his education. At the age of seventeen, he embarked for the Danish island of St Croix, in the West Indies, where a relation of his father had large possessions; but, after a residence of six years, during which he suffered severely from the baneful influence of the climate, he returned to Europe. He then entered the university of Louvain, where he took priest's orders, and was soon afterwards promoted to the chair of natural and moral philosophy. In 1778, he was appointed chaplain to the Neapolitan ambassador at the British court; and having obtained some reputation as a preacher, he published several sermons, which, however, do not appear to have attracted any notice. In 1787, he resolved to conform to the established religion, from "a conviction that he would thus obtain more extensive opportunities of doing good;" and was introduced by Dr Hastings, archdeacon of Dublin, to the congregation of St Peter's church, where he preached on the 24th of June. His audience were impatient to hear him relate the causes of his conversion, but they were disappointed; for, neither at this nor at any other time, did he ever breathe a syllable of contempt or reproach against any religious persuasion whatsoever. For some time after he had conformed to the established religion, he preached every Sunday in St Peter's church; but his reputation as a pulpit orator increased so rapidly that, before the expiration of a year, he was exclusively employed to preach charity sermons, a duty in the discharge of which his success had been unprecedented. In 1788, he was preferred to the prebend of Howth, and in the following year to the parish of St Nicholas Without, the joint incomes of which amounted to about L.400 a year; but he resigned the prebend on being presented, in 1800, to the deanry of Killala. His popularity as a preacher appears to have been extraordinary. Whenever he appeared in the pulpit, multitudes crowded to hear him. He was presented with addresses and pieces of plate from several parishes, and with the freedom of different corporations; his portrait was painted and engraved by the most eminent artists; and the collections made, when he preached, exceeded any thing that had ever been known. Even at periods of public distress, his irresistible powers of persuasion produced, by a single sermon, contributions exceeding a thousand or twelve hundred pounds; and his auditors, not content with emptying their purses into the plate, sometimes threw in jewels or watches, as earnests of future benefactions. But the fire which burned in his bosom at length consumed him, and he died on the 27th of October 1805, exhausted by the fatigues of his vocation, leaving a widow with two sons and two daughters, to whom the king granted a pension of L.300 a year, with reversion to the daughters. In 1814, a volume of his sermons was printed for the benefit of his sons, who were not included in this provision; but from these it would be difficult to discover the cause of his unexampled popularity, since, in point of literary merit, they bear no sort of proportion to the effects which, when delivered by him, they appear to have produced. The master-charm no doubt consisted in the manner, of which it is impossible for us to form any opinion. One thing is certain, however, that, in recommending charity, he was successful beyond all precedent, and that his private character corresponded, in all respects, with the humane and benevolent sentiments expressed in his public discourses. (A.)

KIRWAL, a town of Hindustan, belonging to the Mahrattas, in the province of Malwah, forty-two miles north-west from Bilsah. Long. 78. 13. E. Lat. 24. 2. N.

KISCHENAU, a town of the Russian province of Bessarabia, the capital of a circle of the same name, and the see of a bishop of Bessarabia and Moldavia. It has an ecclesiastical seminary of the Greek church, and about 3500 inhabitants, among whom are many Jews. Long. 29. 2. 55. E. Lat. 46. 59. 30. N.

KISHENAGUR, a town of Hindustan, in the province of Ajmeer, thirteen miles south-east from the city of Ajmeer. It is the capital of a small but independent principality, out of the revenues of which the rajah's descendants, amounting to 5000, are maintained. His government is completely patriarchal. The rajah is of the Rhatore tribe of Rajpoots. Long. 75. 1. E. Lat. 26. 32. N.

Kishenagur, a town and district of Bengal. The town is situated on the south-eastern side of the Jellinghy River. It is the residence of the rajah, and also of the judge-collector of the district of Nuddeah. It is noted for a manufacture of fine cotton cloths. Long. 88. 95. E. Lat. 23. 26. N.

KISHENGUNGA, a river of Hindustan, which has its source in the mountains to the north of the Packoli district, and, after a short course, joins the Jhylum River on the north-west frontier of the province of Lahore.

KISHLAK, a town of Persia, on the road from Shiraz to Ispahan, 146 miles west of Shiraz.

KISHM, Kishmee, or Jezira Derawz (Long Island). This is the largest island in the Persian Gulf, which extends sixty miles along the Persian shore, and is in no place more than twelve miles in breadth. The channel by which it is separated from the continent, which is from three to eight miles wide at the northern point of the island, is navigable for the largest vessels. This island has a most desolate and unpromising aspect; from whatever quarter it is seen, it presents nothing but light-gray rocks of shells or calcareous stone or brown sand, entirely devoid of verdure. The inhabitants, who amount to about 10,000, including the population of Kishmee, the capital, live chiefly by fishing and agriculture; and there are a few productive spots on the island, which yield a small supply of dates, as well as of wheat and barley. They also breed cattle and sheep, and the latter are said to thrive well. But this island, though now barren and deserted, is said at one time to have presented a very different appearance. It contained, we are informed, 360 well-inhabited villages, with date and fruit tree gardens; and from Ormuz, when it was in the height of its glory, were sent supplies of fruit, vegetables, and many descriptions of provisions. Since that period it has been the scene of great disturbance and rapine; pirates having of late years made descents upon it, plundering and destroying every thing within their reach, and wantonly cutting down the date and fruit trees, so that it can hardly supply the few remaining families with the food which they require. The fear of these descents drove the greater part of the inhabitants into the town of Kishmee, which is walled, and prepared for defence, and contains 8000 inhabitants, though Fraser, by whom it was visited in 1821, considers the number as rather exaggerated. The harbour or roadstead is not very safe, being open on the north-east to the deep channel that lies between it and Gomberoon; so that during the prevalence of the north-east winds, which blow violently from November to February, boats cannot land for many days together, on account of the surf. For eight months of the year, however, the roadstead may be considered as safe, since it has good holding ground. The island is afflicted with a scarcity of water, and with great heats, which are extremely distressing, from the excessive dryness, and the great glare reflected from the rocks. The thermometer is frequently at 110° in the shade. Upon this parched and dreary spot a British force, consisting of Sepoys and Europeans, was landed from India, in order to overcome the Arab piratical powers who molested the navigation of these seas. But they suffered severely from the united influence of the sultry climate and the want of shelter and of food and water. The island is at present under the rule of an independent Arab scheik, who pays homage to the imaums of Muscat. The town is situated close to the sea, in lat. 26. 57. 30. N.

KISHTEWAR, a district of Hindustan, in the north-eastern extremity of the province of Lahore, situated principally between the 33d and 34th degrees of N. lat. It is bounded on the north-west by the southern range of the Cashmere Hills. The country is in general hilly and covered with wood, and but thinly inhabited. It is also very cold during the winter season, and presenting few temptations to invaders, has probably on that account retained its independence. It is intersected by the river Chunaub, over which there are no bridges; and at the village of Nausman, where it is seventy yards wide, it is crossed by means of a large basket slung to a tight rope, which reaches from side to side, and along which it is pulled. Kishtewar, the capital, which is the residence of a Mahommedan chief, is situated close under the southern range of the Cashmere Mountains. Long. 75. 20. E. Lat. 34. 7. N.

KISLOVODSKOI, a fort of Asiatic Russia, in the government of Caucasus, and district of Georgiefsk. It has been erected to protect the patients who resort to the remarkable mineral water lately discovered there, which, when it is first drawn from the spring, is perfectly limpid, but soon froths like the best champaign, and also affects the tongue with an agreeable acid taste.

KISSER, a small inhabited island, in the Eastern Seas, about twenty miles in circumference, lying off the north-eastern extremity of Timor. It affords refreshments to shipping. Long. 127. 5. E. Lat 8. 5. S.

KISSING, by way of salutation, or as a token of respect, has been practised in all nations. The Roman emperors saluted their principal officers by a kiss. Kissing the mouth or the eyes was the usual compliment upon any promotion or happy event. Soldiers kissed the general's hand when he quitted his office. Fathers, amongst the Romans, had so much delicacy, that they never embraced their wives in the presence of their daughters. Near relations were allowed to kiss their female kindred on the mouth. Slaves kissed their master's hand, who used to hold it out to them for that purpose. Kissing was a customary mode of salutation amongst the Jews, as we may collect from the circumstance of Judas approaching his Master with a kiss. Relations used to kiss their kindred when dying, and when dead; when dying, out of a strange opinion that they would imbibe the departing soul; and when dead, by way of valedictory ceremony. They even kissed the corpse after it was conveyed to the pile, when it had been seven or eight days dead.

KISTNAGHERRY, a town and fortress of Hindustan, in the province of Barramahal, 105 miles west from Seringapatam. Long. 78. 23. E. Lat. 12. 32. N. It is situated on a rock 700 feet in perpendicular height, and so remarkably bare and steep that it has never been taken, except by surprise. In 1791 the British troops were repulsed in an attempt to storm this fortress. It was subsequently ceded to them, and the fortress destroyed.

KISTNAH, or Krishnah, a celebrated river in the south of India, which has its source in the Western Ghauts, not far from Sattarah, in the province of Bejapoor, which is only fifty miles in a direct line from the western sea-coast. It proceeds from hence in a south-westerly direction until it reaches Merritch, when its bulk is greatly increased by the junction of the river Worrah, formed by a variety of streamlets that fall from the Ghauts. During its course eastward it is joined by the Malpurba, Gutpurba, Beemah, and Toombuddra rivers; and pours its prodigious volume of waters by various mouths into the Bay of Bengal, at or a little to the southward of Masulipatam, where it forms the northern boundary of the Guntoor Circars. Its course, including its windings, may be estimated at 650 miles in length; and its waters fertilize the provinces of Bejapoor, Beeder, Hyderabad, and the districts of Paulnaud, Guntoor, and Condapilly. The term Krishna signifies black or dark blue, and is the name of the favourite deity of the Hindus, an incarnation of the preserving power of Vishnu. It forms the boundary of the Deccan, according to the best Mahommedan authors.

KISTNAPATAM, a town of Hindustan, on the sea-coast of the Carnatic, eighty-seven miles north from Madras. Long. 80. 16. E. Lat. 14. 19. N.

KIT, in *Music*, the name of a small violin, of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, measuring from the extremities, is about sixteen inches, and that of the bow about seventeen. Small as this instrument is, its powers are co-extensive with those of the violin.

Kit-Cat-Club, an association of above thirty noblemen and gentlemen of distinguished merit, formed in 1703, for the purpose of uniting their zeal in favour of the protestant succession in the house of Hanover. Their name was derived from Christopher Kat, a pastry cook, near the tavern where they met, in King's Street, Westminster, who often supplied them with tarts. Old Jacob Tonson was their bookseller. Their portraits were painted by Sir Godfrey Kneller.

KITCHEN, the room in a house where the provisions are cooked.

KITSINGEN, a city of Bavaria, and the capital of the bailiwick of the same name, in the circle of the Upper Maine. It stands on the right bank of the Maine, over which is a bridge 1000 feet long, connecting it with the suburb Etwashausen, both of which are surrounded with walls and ditches, and flanked by towers. It contains four churches, a convent, and hospital, and 784 houses, with 3850 inhabitants. It is one of the chief trading places on the river, with good wharfs and cranes. It has some manufactures of cotton, but its chief commerce is wood, wine, corn, and other productions of the soil.

KITTOOR, a town and district in the peshwa's territories, in the province of Bejapoor, twenty miles south-east from Merritch. In 1804 the renter of the district complained that it was wasted by the neighbouring feudatories, and also by the peshwa's own deputy; when, by the interference of the British, these grievances were redressed. The country is fertile.

KIUN-CHEU-FOU, a city of China, of the first rank, capital of the island of Hainan. It has a port at two miles distance, formed by a river, and much frequented by Chinese vessels. It has also a considerable trade.

KIUTAIAH, a large city of Asia Minor, and capital of Anatolia. It is situated at the foot and partly up the sides of a cluster of mountains, bounded by a fertile plain on the south. It covers a considerable extent of ground. The houses are large and well furnished, and it contains handsome fountains conveyed from the hills by aqueducts. It is not so populous as it was formerly, but it still contains between 50,000 and 60,000 inhabitants, of which number 10,000 are Armenians, and 5000 Greeks. It contains thirty public baths, fifty mosques, four Armenian and one Greek church, and twenty caravanserais. It occupies the position of the ancient Cotyæum, on the site of which there are still the ruins of a castle. Long. 29. 52. E. Lat. 39. 25. N.

KIU-TCHEOU-FOU, a town of China, in Tchekiang, of the first rank, situated on a fine river. It borders both on Kiangsee and Fotchien, from which last it is separated by a range of very rugged mountains, the ascent to which is by stairs. Long. 118. 39. E. Lat. 29. 2. N.

KIZILBACHES, a people of Asiatic Russia, in the government of Orenburg. They are not numerous, and consist chiefly of Persians who have been taken captive by the Kirghisses.

KIZILERMAK, a large river in Asia Minor, which has its rise from Mount Argish, near Kaisarieh, and, after flowing a considerable space westwards, turns to the south, and falls into the Black Sea about forty miles south of Samsoon, in long. 36. 10. E. lat. 41. 30. N. It is the ancient Halys, and is the finest river in Asia Minor.

KIZILOZIEN, or golden stream, a considerable river of Persia, which is the natural boundary between the provinces of Irak and Azerbijan. According to Rennell, it is the Gozan of the Scripture, and has its source eight or nine miles to the north-west of Sennah in Kurdistan. It runs along the north-west frontier of Irak, and passes under the Kafatan Koh, or mountain of tigers, when it is met a few miles to the east of Meanna by the Karanku, which takes its rise to the westward of that town, in the mountains of Sahund. These two rivers combined force a passage through the great range of the Caucasus, and during their course form a junction with the Shahrood, a river formed by two streams, one of which comes from the vicinity of Cazween, and the other from the mountain of Elburz, behind Teheran. The collective waters, under the designation of Sifeed Rood, or White River, so named from the foam occasioned by the rapidity of its current, flows in a meandering course through Ghilan to the Caspian Sea.

KIZLAR, a fortified town and capital of a district of the government of Caucasus, in Asiatic Russia. It is situated on the Terek, near its entrance into the Caspian Sea. It carries on a considerable trade, being a sort of entrepôt for the commerce of Astrakan with Persia and the interior of the Caucasus. It exports considerable quantities of wine, brandy, and silk; also the oil of sesamus, which answers the same purpose as the oil of olives. It was built in 1736, and is always garrisoned by two battalions, composed of the tribes who wander over the immense steppe between Kizlar and Astrakan. They are chiefly Nogays, Troukhmen, and Kalmucks. Long. 46. 29. E. Lat. 43. 31. N.

KLAGENFURT, a circle of the Austrian government of Illyria, bounded on the north and the east by Steyermark, on the south by Laybach, and on the west by Villach. It extends over 1944 square miles, and comprehends nine cities with their suburbs, fourteen market-towns, and 1626 villages and hamlets, having 27,337 houses, and 163,759 inhabitants. It is generally a mountainous district, containing very lofty peaks and ridges, but having between them many valleys beautifully picturesque and highly fertile. The chief place is the city which gives its name to the circle. Near to it is a lake whose waters form the river Glan, on whose bank it is built, and whence the northern canal is supplied with its water. It is an open town, well built, containing seven churches, two hospitals, an ursuline convent, and orphan house, besides an established lyceum and gymnasium, with schools for education in law and physic. It contains 778 houses, and 9840 inhabitants, of whom some are employed in manufactures of fine cloth, cotton goods, silks, and white lead. Long. 13. 55. 57. E. Lat. 46. 12. N.

KLAPROTH, MARTIN HENRY, a celebrated Prussian chemist, professor of chemistry, member of the Academy of Sciences at Berlin, foreign associate of the Institute of France, and of several other academies and learned societies, was born at Berlin, on the 1st of December 1743. He had received from nature an observing, serious, reflecting mind, and a capacity of patient application which nothing could tire out or exhaust. After having terminated his classical studies, he applied himself wholly to that of mineralogy, for which he had a decided predilection; but he felt that he could not make rapid progress therein without calling in the aid of chemistry, wherefore he devoted himself to these two branches of physical science. The analysis of minerals appeared to him of extreme importance with reference to the proper classification of these unorganic substances; and multiplied experiments soon afforded him the means of varying the chemical processes, and of recognizing new elements in the minerals which had already been subjected to analysis. It was thus that he discovered zircon in the jargon of Ceylon; that he demonstrated the presence of potash in volcanic productions; that he made known the sulphate of strontian; that he found potash in the leucite or white garnet; that he discovered in red schorl a new metal, which he named *titanium*, another in pechblende which he called *uranium*, and a third in the ore of white gold, to which he gave the name of *tellurium.* He also made known the molybdate of lead, and proved that the ore of red silver was a sulphuret of silver and antimony. Such are the most important of M. Klaproth's labours, those, in fact, which entitle him to rank amongst the most distinguished chemists of his age; but he published, besides, a considerable number of analyses of fossil substances, which may be found in the *Journal de Physique*, the *Annales de Chimie*, the *Journal des Mines*, and other collections of this sort. He also prepared a mineralogical system, which is mainly founded upon the constituent principles of minerals. His memoirs of chemistry have been collected and translated into French by Tassaert, Paris, 1807, in two vols. 8vo. Lastly, he composed, in conjunction with Wolf, a Dictionary of Chemistry, in four vols. 8vo; a work which was translated into French by Bouillon-Lagrange and Vagel. Klaproth greatly contributed to advance the science of mineralogy, and his researches have thrown much light on the system of Werner, as well as on the classification of Haüy. His discoveries, and, above all, his particular means of analysis, have served to guide several French chemists, who are indebted to him for part, at least, of the fortunate results which have rewarded their researches. This distinguished mineralogist died at Berlin, on the 1st of January 1817. (A.)

KLATTAU, a circle of the Austrian kingdom of Bohemia, extending over 1012 square miles, and comprehending twenty-six cities and towns, 638 villages and hamlets, with 22,058 houses, inhabited by 145,824 persons. The capital, a city of the same name, situated on the river Bradlenka, contains 527 houses, and 4126 inhabitants, who are employed in making woollen cloths and hosiery, and in working in some marble and serpentine quarries near it. Long. 13. 16. 55. E. Lat. 49. 23. 42. N.

KLAUSENBURG, a city, the capital of the Austrian province Siebenbirgen. It stands on the river Szamos, is fortified, and divided into the upper and lower towns. It contains five Catholic, one Unitarian, one reformed, and one Lutheran church, 1800 houses, and 20,600 inhabitants. It is a seat of instruction for the several sects. There is a Catholic seminary, with sixteen professors, for medicine, law, and philosophy; an Unitarian college, with a rector, three curators, eleven professors, and 300 students; a Calvinist and a Lutheran seminary. There is a china and some other manufactories; and it is the residence of many of the pure old Hungarian noble families, who maintain a theatre and other public recreations. It is in Long. 23. 29. 23. E. Lat. 46. 44. 8. N. In the Hungarian language it is called Kolosvartz.

KLEIST, Edward Christiaden, a German poet, and a soldier of distinguished bravery, was born at Zeblin, in Pomerania, in 1715. At nine years of age he was sent to pursue his studies at Cron, in Poland; and he afterwards studied at Dantzic and Königsberg. Having finished his studies, he went to visit his relations in Denmark, who invited him to settle there; and having in vain endeavoured to obtain preferment in the law, at twenty-one years of age he accepted of a post in the Danish army. He then applied himself to the study of all the sciences that have a relation to military affairs, with the same assiduity as he had before studied civil law. In 1740, at the beginning of the reign of Frederick king of Prussia, Mr de Kleist went to Berlin, and was presented to his majesty, who made him lieutenant of his brother Prince Henry's regiment; and he was in all the compaigns which distinguished the first five years of the king of Prussia's reign. In 1749 he obtained the post of captain; and in that year he published his poem on the Spring. Before the breaking out of the war, the king chose him, with some other officers at Potsdam, as companions to the young prince Frederic William of Prussia, and to eat at his table. In the first campaign, in 1756, he was nominated major of Hausen's regiment, which being in garrison at Leipsic, he had time to finish several new poems. After the battle of Rosbach, the king gave him, by an order in his own hand-writing, the inspection of the great hospital established at Leipsic. On this occasion his humanity was celebrated by the sick and wounded of both parties, and his disinterestedness was equally admired by all the inhabitants of that city. In 1758, Prince Henry coming to Leipsic, Mr de Kleist desired to serve in his army with the regiment of Hausen, which was readily granted. Opportunities of distinguishing himself could not be wanting under that great officer, and he always communicated his courage to the battalion under his command. He also served that prince at the beginning of the campaign of 1759, when he was with him in Franconia, and in all the expeditions of that army, till he was detached with the troops under General de Fink to join the king's army. On the 12th of August was fought the bloody battle of Kunnersdorf, in which he fell. His poems, which are greatly admired, are printed in the German tongue, in two volumes 8vo.

KLIN, a circle in the Russian government of Moscow, which extends over 1347 square miles, comprehending one town and 606 villages, with 8000 houses, and 62,380 inhabitants. The capital, of the same name, is a town situated on the river Sestra, with 1250 inhabitants. Long. 36. 40. E. Lat. 56. 20. N.

KLINOMETER, or Clinometer (from κλινω, which denotes inclination, and μετρον), the name of an instrument contrived by the late Lord Webb Seymour, a nobleman who devoted his life to the cultivation of science. This instrument is intended to be used by the geologist for measuring the inclination of stratified rocks, and the azimuth in which that inclination lies.

If a plummet-level be applied to an inclined plane in that position in which the edge or base of the plummet-level is horizontal, and if the edge of the plummet-level be then turned round ninety degrees in the inclined plane, the angle formed by the plumb-line with the line which is perpendicular to the edge of the plummet-level is equal to the inclination of the inclined line to the horizon. On the same principle the inclination of a plane to the horizon is measured by the klinometer.

In the klinometer represented at Plate XCIV. fig. 1, AC is a circular plate, the circumference of which is divided into 360 degrees; it has three short feet on its under surface, one of which is seen at S.

The feet on the under side of the plate are of wood, which is preferred to metal, as less liable to slip when placed on an inclined surface. The ends of the feet are in a plane parallel to the upper surface of the circular plate. The fibre of the wood is set perpendicular to the plate, to diminish the derangement which may happen by the expansion of the wood from moisture.

The arm CG is moveable round the centre of the circular plate. D is an oval hole, through which is moveable the catch of a sliding bolt; this bolt passes on the under side of the circular plate; the catch of the bolt is made flush with the surface of the circular plate. The bolt serves to fix the arm CG on the circular plate. When the instrument is to be used, C is the axis round which the arm CG turns. When the three short feet of the circular plate are placed on the inclined surface of a stratified rock, the arm which bears the spirit level EE is moved down to the lowest point of the quadrant DD, and the arm CG is moved round till the bubble stands in the middle of the level; the arm CG and the level are then in the intersection of the inclined stratum with a plane parallel to the horizon: the degree on the edge of the circular plate at which the arm CG now stands is noted, and the arm CG is to be moved round through ninety degrees of the circular plate upwards; when the arm CG is arrived at this second position, it is in the line of the greatest inclination of the stratified rock. The arm which bears the spirit level EE is then to be raised, by turning it on the centre of the quadrant; and when the bubble stands in the middle of the level, the arm will indicate, on the limb of the quadrant, the degree of inclination of the stratified rock. The magnetic needle in the box OO will, at the same time, show the magnetic azimuth, formed by the vertical plane, which contains the angle of greatest inclination; and this magnetic azimuth is to be converted into true azimuth by applying the number of degrees that the needle varies from the true meridian, at the particular time and place where the observation is made. The box OO has both the top and the bottom made of glass, so that the needle may be observed both when the instrument is placed on the upper surface, and when the instrument is applied to the under surface, of an inclined plane. When the instrument is not in use, the arm CG, with the quadrant and compass, are unfixed, and taken off from the circular plate, by withdrawing the catch of the bolt which is seen at *d*. The compass-box OO is turned round an axis, which is seen below the spirit level EE, so that the compass-box comes into the same plane with the quadrant, and then the quadrant, compass-box, and arm, CG, pack into a flat box. The circular plate ACS is now separate from the other parts of the instrument, and lies flat in another part of the box made for packing the instrument. Lord Webb Seymour's account of this instrument is published in the *Transactions of the Geological Society*, vol. iii. 1816.

KLOPPENBURG, a circle of the duchy of Oldenburg, in Germany. It extends over 612 square miles, and contains one town and fifteen parishes, with 5023 houses, and 26,964 inhabitants. The chief town, of the same name, is situated on the river Soste, containing 151 houses, and 860 inhabitants; but the whole parish has a population of 4790.

KLOPSTOCK, Frederic Theophilus, was born at Quedlinburg in 1724, and one of the most celebrated of the German poets. His father was a man of an elevated character, and a magistrate of that place, who afterwards farmed a bailiwick in the Brandenburg part of Mansfield. Klopstock was the oldest of eleven children, and having received the rudiments of education at home, he was put to the public school of Quedlinburg, where he soon became conspicuous both for bodily and mental exercises. He went to the college of the same place at the age of sixteen, where, under the tuition of an able teacher, he obtained a knowledge of, and taste for, the beauties of the best classical authors. He composed some pastorals in verse; and even at this early period he conceived the bold design of writing an epic poem, fixing at length, after much deliberation, on the Messiah, by which he has rendered his name immortal.

He commenced the study of theology at the University of Jena, in the year 1745, although in his retirement he was constantly ruminating on his great projected work already mentioned, sketching out the three first cantos. They were first written in prose, as the common measure of German verse did not accord with his own sentiments. Transported with the melody of Homer's and Virgil's strains, he determined to make trial of German hexameters, in which he succeeded so entirely to his own satisfaction, that he fixed upon this majestic verse for the whole of his poem. By his removal from Jena to Leipzig in 1746, he became acquainted with a number of young votaries of the muses, who occasionally published their essays in a paper called the *Bremen Contributions*, in which appeared the three cantos of Klopstock's Messiah, and a number of his odes, for which he was so applauded as to animate him to persevere.

He quitted Leipzig in 1748, and resided at Langensalza, where he carried on a fruitless correspondence with a beautiful young lady, who discovered no inclination to return his passion, which for some time threw a gloom over his mind. He now published ten books of his Messiah, by which he came to be known and admired all over Germany. It was an extremely popular work amongst all those who were at once the lovers of poetry and devotion. It was quoted from the pulpit by young divines, whilst others of a more stern deportment found fault with the author, as indulging too much in fiction on sacred topics.

He travelled into Switzerland in 1750, to pay a visit to Bodmer of Zurich, in consequence of an invitation, and was received with every token of respect. The sublime scenery of that country, the simplicity of its inhabitants, and the freedom they enjoyed, were admirably suited to the taste and sentiments of Klopstock. Here in all probability he would have breathed his last, had not Baron Bernstorff, who was charmed with his poetry, engaged Count Molke, after returning from France to Copenhagen, to invite him to that city, with assurances of such a pension as would make him independent. Our author accordingly set out for Copenhagen in the year 1751, by the way of Brunswick and Hamburg, at which latter place he became acquainted with a young lady, Miss Moller, of literary abilities, and a heart susceptible of tender impressions. They were soon afterwards married, and seemed destined by Providence to be one of the happiest couples upon earth; but he was early deprived of her, for she died in childbed, and her memory was sacred to Klopstock to the last hour of his existence. He lived for the most part at Copenhagen till the year 1771, after which he resided at Hamburg in the capacity of royal Danish legate, and counsellor of the margrave of Baden, who gave him a pension, and engaged him to pass the year 1775 at his palace of Carlsruhe. Such was the diffidence of our poet, that it required the most extraordinary condescension on the part of the great to make him easy in their presence.

The decline of his health made no change on the habitual tranquillity of his mind; he contemplated his approaching dissolution without any dismay, and his pious fortitude continued unshaken amidst the severest sufferings. He died at Hamburg in March 1803, being then seventy-nine years of age, and his funeral was attended with such honours as justly belonged to the greatest poet of the country.

The character of Klopstock as a poet is that of exuberance of imagination and sentiment. His sublimity, which is nearly unparalleled, makes him almost lose himself in mystical extravagance. A great critic claims for the author of the Messiah a rank amongst the very first class of poets. His odes and lyric poems are much admired by his countrymen; and his dramatic works display great force and dignity, but are thought to be better adapted to the closet than the theatre. He was also an excellent prose writer, as is fully evinced by his *Grammatical Dialogues*.

KLOSTERNEUBURG, a city of Austria, in the province of the Lower Ens. It is situated on the river Danube, and walled; but the fortifications are dilapidated. It is chiefly remarkable from an establishment for education of an ancient date, which is still maintained, consisting of seventeen professors, with a library of 25,000 volumes, and a museum. The houses are 479, with 3400 inhabitants.

KNAPSACK, in a military sense, a rough leathern bag which a soldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient, and should be made with a division to hold the shoes and other articles separate from the linen.

KNARESBOROUGH, a town of the west riding of the county of York, in the wapentake of Claro, 215 miles from London by Nottingham, and 202 by York. It is situated on the side of a hill, almost surrounded by the river Nidd. It was formerly fortified, and had a castle built in the reign of William the Conqueror. It was a burgage tenure borough, and sent two members to parliament, who are now chosen by the ten-pound house-keepers. The chief trade is the linen manufacture, which is extensive. Near the town are some mineral springs of medicinal virtue, but they are not much resorted to. A dropping well, with great petrifying power, is a curiosity, about a mile from the town. There is a market on Wednesday, which is well attended; and there are eight fairs, at which much business is transacted. The inhabitants amounted in 1801 to 3388, in 1811 to 4234, in 1821 to 5283, and in 1831 to 5296.

KNAVE, an old Saxon word, which had at first a sense of simplicity and innocence, for it signified a *boy;* Sax. *cnapa*, whence a *knave child*, or a boy, distinguished from a girl, in several old writers; afterwards it was taken for a servant boy, and at length for any servant man. It was also applied to a minister or officer who bore the shield or weapon of his superior; as *field knapa*, whom the Latins call *armiger*, and the French *escuyer* (14 Edw. III. c. 3). And it was sometimes of old made use of as a titular addition, as *Joannes C. filius Willielmi C. de Derby, knave* (22 Hen. VII. c. 37). The word is now perverted to the hardest meaning, viz. *a false, deceitful fellow.*

KNEE, in a ship, a crooked piece of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides or timbers. The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite.

Knee of the Head, a large, flat piece of timber, fixed edgewise upon the fore part of a ship's stem, and supporting the ornamental figure or image placed under the bowsprit.

The *knee of the head* is a phrase peculiar to shipwrights, as this piece is always called the *cut-water* by seamen, if we except a few, who, affecting to be wiser than their brethren, have adopted this expression, probably on the presumption that the other is a cant phrase or vulgarism.

Carling Knees, in a ship, those timbers which extend from the ship to the hatchway, and bear up the deck on both sides.

KNELLER, Sir Godfrey, a painter whose fame is well established in these kingdoms. He was born at Lubeck in 1648, and received his first instructions in the school of Rembrandt, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caracci. He afterwards visited Venice, and distinguished himself so effectually in that city by his historical pictures and his portraits of the noble families there, that his reputation became considerable in Italy. By the advice of some friends he came at last to England, where it was his good fortune to gain the favour of the Duke of Monmouth, by whose recommendation he more than once painted the portrait of King Charles II. who was so pleased with his skill in doing it, that he used to come and sit to him at his house in Covent Garden piazza. The death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more incessant employment, and no painter could be more distinguished by public honour. He was state painter to Charles II. James II. William III. Queen Anne, and George I., and equally esteemed and respected by them all. The Emperor Leopold made him a knight of the Roman empire, and King George I. created him a baronet. Most of the nobility and gentry had their likenesses taken by him; and no painter excelled him in a sure outline, or in the graceful disposition of his figures. His works were celebrated by the best poets in his time. He built an elegant house at Whitton, near Hampton Court, where he spent the latter part of his life, and died in 1726.

KNIEPHAUSEN, a district, formerly an independent sovereign state, but now a part of the grand duchy of Oldenburg, in Germany. During the late war the greater number of Dutch vessels were rendered neutral by the count of this district, and under the colours of Kniephausen were received in the English ports. It contains two parishes, with three churches, a strong castle, and 590 houses, with 3800 inhabitants. Though ceded to Oldenburg when mediatised, Count Bentick, the sovereign, has protested against the cession, and still maintains his claim to the dominion.

KNIFE, a well-known instrument, made for cutting, and adapted in form to the uses for which it is designed. Knives are said to have been first made in England in 1563, by one Matthews, on Fleet Bridge, London. The importation of all sorts of knives is prohibited.

KNIGHT (*eques*), amongst the Romans, a person of the second degree of nobility, following immediately that of the senators.

Knight (or *Cnecht*, Germ.), in feudal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privilege of bearing arms. See Chivalry.

There is scarcely a prince in Europe who has not thought fit to institute an order of knighthood; and the simple title of *knight*, which the kings of Britain confer on private subjects, is a derivation from ancient chivalry, although very remote from its source.

Knight-Service (*servitium militare*, and in law French *chivalry*), a species of feudal tenure. The knights created by this tenure differed most essentially from the knights of chivalry, though the difference seems not to have been accurately attended to by authors. The one class of knights was of a high antiquity, the other was not heard of till the invention of a fee. The adorning with arms and the blow of the sword made the act of the creation of the ancient knight; the new knight was constituted by an investment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour, knight-service a tenure. The first communicated splendour to an army, the last gave it strength and numbers. The knight of honour might serve in any station whatever, the knight of tenure was in the rank of a soldier. By the tenure of knight-service the greater part of the lands in England were holden, and that principally of the king *in capite*, till the middle of the seventeenth century; and it was created, as Sir Edward Coke expressly testifies, for a military purpose, viz. for defence of the realm by the king's own principal subjects, which was judged to be much better than to trust to hirelings or foreigners. The description here given is that of knight-service proper, which was to attend the king in his wars. There were also some other species of knight-service, so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight-service

Knights-Errant || Military Knighthood.

proper, and because they were attended with similar fruits and consequences. Such was the tenure by *grand serjeanty, per magnum servitium*, whereby the tenant was bound, instead of serving the king *generally* in his wars, to do some special honorary service to the king in person, as to carry his banner, his sword, or the like, or be his butler, champion, or other officer, at his coronation. It was, in most other respects, like knight-service, only he was not bound to pay aid or escuage; and when tenant by knight-service paid five pounds for a relief on every knight's fee, tenant by grand serjeanty paid one year's value of his land, were it much or little. Tenure by *cornage*, which was to wind a horn when the Scotch or other enemies entered the land, in order to warn the king's subjects, was, like other services of the same nature, a species of grand serjeanty.

These services, both of chivalry and grand serjeanty, were all personal, and uncertain as to their quantity or duration. But the personal attendance in knight-service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time making a pecuniary satisfaction to the lords in lieu of it. By the degenerating of knight-service, or personal military duty, into escuage or pecuniary assessments, all the advantages, either promised or real, of the feodal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. The military tenures, with all their heavy appendages, were at length destroyed at one blow, by the statute 12 Charles II. c. 24; a statute which was a greater acquisition to the civil property of this kingdom than even *magna charta* itself, since that only pruned the luxuriances which had grown out of the military tenures, and thereby preserved them in vigour; but the statute of King Charles extirpated the whole, and demolished both root and branches.

Knights-Errant. During the prevalence of chivalry, the ardour of redressing wrongs seized many knights so powerfully, that, attended by esquires, they wandered about in search of objects whose misfortunes and misery required their assistance and succour. And as ladies engaged more particularly their attention, the relief of unfortunate damsels was the achievement they most courted. This gave birth to knights-errant, whose adventures produced romances. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in the wildest exaggerations; and poetry lent her charms to the most monstrous fictions, and to scenes the most unnatural and grotesque.

Knights, in a ship, two short, thick pieces of wood, commonly carved like a man's head, having four shivers in each, three for the haulyards, and one for the top to run in. One of them stands fast bolted on the beams abaft the foremast, and is therefore called the *fore-knight;* and the other, standing abaft the mainmast, is called the *main-knight.*

Knight's *Island*, in the Pacific Ocean, the largest of three islands called the Snares by Vancouver. It was discovered in 1791. The south point is situated in Long. 166. 44. E. Lat. 48. 15. S.

KNIGHTHOOD, a military order or honour, or a mark or degree of ancient nobility, or reward of personal virtue and merit. There are four kinds of knighthood; military, regular, honorary, and social.

Military Knighthood is that of the ancient knights, who acquired it by high feats of arms. They are called *milites* in ancient charters and titles, by which they were distinguished from mere bachelors, and others. These knights were girt with a sword, and wore a pair of gilt spurs; whence they were called *equites aurati*. Knighthood is not hereditary, but acquired. It does not come into the world with a man, like nobility, nor can it be revoked.

Regular Knighthood || Knout.

Regular Knighthood is applied to all military orders which profess to wear some particular habit. Such were the knights templars, and such also the knights of Malta.

Honorary Knighthood is that which princes confer on other princes, and even on their own great ministers and favourites; such are knights of the Garter, Bath, St Patrick, Nova Scotia, Thistle, and the like.

Social Knighthood is that which is not fixed or confirmed by any formal institution, nor regulated by any lasting statutes; of which kind many orders have been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

KNIGHTON, a market-town of the county of Radnor, and hundred of its own name, in South Wales. It is a well-built town, on the side of a hill, overlooked by a lofty mountain. An old intrenchment, called Ossa Dyke, which extends from the Dee to the Wye, runs at the bottom of the town, and is said to have formed the boundary between England and Wales. There is a market, which is held on Thursday. The inhabitants amounted in 1801 to 785, in 1811 to 952, in 1821 to 1000, and in 1831 to 1076.

KNITTLINGEN, a market-town of the bailiwick of Maulbroun, and circle of the Neckar, in the kingdom of Wirtemberg. It contains 304 houses and 2380 inhabitants.

KNOLLES, Richard, was born in Northamptonshire about the middle of the sixteenth century, and educated at Oxford, after which he was appointed master of the free school at Sandwich in Kent. He composed *Grammaticæ Latinæ, Græcæ, et Hebraicæ, compendium, cum radicibus*, London, 1606, and sent many excellent scholars to the universities. He also spent twelve years in compiling a history of the Turks, which was first printed in 1610. It is called the General History of the Turks, from the first beginning of that nation to the rising of the Ottoman family. He died in 1610, and this history has been since continued by several hands; but the best continuation is that by Paul Ricaut, consul at Smyrna, folio, London, 1680. Knolles wrote also the Lives and Conquests of the Ottoman Kings and Emperors to the year 1610, which was not printed till after his death in 1621, to which time it was continued by another hand; and, lastly, a Brief Discourse of the greatness of the Turkish empire, and wherein the greatness of the strength thereof consisteth.

KNOUT, the name of a punishment inflicted in Russia, with a kind of whip called *knout*, and made of a long strap of leather prepared for this purpose. With this whip the executioners dexterously carry off a slip of skin from the neck to the bottom of the back, laid bare to the waist, and, repeating their blows, in a little while rend away all the skin of the back in parallel stripes. In the common knout the criminal receives the lashes suspended on the back of one of the executioners; but in the great knout the criminal is raised into the air by means of a pulley fixed to the gallows, and a cord fastened to the two wrists tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breast. Sometimes his hands are tied behind his back; and when he is pulled up in this position his shoulders are dislocated. The executioners can make this punishment more or less severe; and, it is said, are so dexterous, that when a criminal is condemned to die, they can make him expire at pleasure, either by one or several lashes.

KNOX, JOHN, the great reformer of Scotland, was born at the village of Gifford in Haddingtonshire in the year 1505. His father is said, though perhaps without foundation, to have been descended from the family of Ranferly, in the same county. The name of his mother was Sinclair; and some of his letters, written in seasons of danger, were subscribed John Sinclair. Whatever might be the lineage or the situation of the father, the son was enabled to obtain the benefit of a liberal education, such as his native country could then afford. After having been instructed in the Latin language at Haddington school, he was in the year 1521 sent to the university of Glasgow, where philosophy and divinity were taught by John Mair, a celebrated schoolman. The Greek and Hebrew languages were not then publicly taught in Scotland; but the former of these he acquired when he was yet in the vigour of life, and the latter during the period of his continental exile. It is not sufficiently ascertained that he took a degree; but if it be correctly stated that he publicly taught philosophy in this university, and afterwards at St Andrews, we are perhaps to infer that he was a master of arts.

He soon felt himself dissatisfied with the dry and barren speculations of scholastic philosophy and scholastic theology, and was gradually conducted to a more edifying course of enquiry. Not contented, as his excellent and lamented biographer has stated, with the extracts "from ancient authors, which he found in the writings of the scholastic divines and canonists, he resolved to have recourse to the original works. In them he found a method of investigating and communicating truth, to which he had hitherto been a stranger, and the simplicity of which recommended itself to his mind, in spite of the prejudices of education, and the pride of superior attainments in his own favourite art. Among the fathers of the Christian church, Jerom and Augustine attracted his particular attention. By the writings of the former, he was led to the Scriptures as the only pure fountain of divine truth, and instructed in the utility of studying them in the original languages. In the works of the latter, he found religious sentiments very opposite to those taught in the Romish church, who, while she retained his name as a saint in her calendar, had banished his doctrine, as heretical, from her pulpits. From this time, he renounced the study of scholastic theology; and although not yet completely emancipated from superstition, his mind was fitted for improving the means which Providence had prepared, for leading him to a fuller and more comprehensive view of the system of evangelical religion. It was about the year 1535 when this favourable change commenced; but it does not appear that he professed himself a protestant before the year 1542." The reformed doctrines had been preached to his benighted countrymen by Patrick Hamilton, abbot of Ferme, who was allied to the royal family, and who had the higher honour of being the proto-martyr of Scotland to the protestant faith. On the last of February 1528, he was most inhumanly committed to the flames in the archiepiscopal city of St Andrews. But the seed which he had thus moistened with his blood, sprung from the ground with a degree of vigour which the foulest blasts of persecution were found incapable of withering. The new opinions were gradually adopted by men of learning as well as of rank. Between the years 1530 and 1540, a considerable number of victims was doomed to a cruel death, while others escaped the fangs of their persecutors, and sought refuge in England and on the continent. Several of these exiles, and among the rest George Buchanan and Alexander Aless, were men distinguished by their talents and learning, who obtained preferment in foreign universities, and there reflected credit on their native country.

During those times of persecution, Knox was engaged in teaching philosophy in the university of St Andrews, though it does not clearly appear that he held the office of a regent or professor. Several individuals of his acquaintance had embraced the reformed doctrines: the force of truth gradually affected his own mind, and he arrived at complete conviction in the year 1542, having then attained the age of thirty-seven. As he began to recommend to his pupils a more rational and edifying method of study, he excited some suspicions of heretical pravity; but when he proceeded so far as to expose certain corruptions of the church, he speedily found it necessary to change his place of residence. Having retired to the south of Scotland, and there avowed his adherence to the cause of reformation, he was declared a heretic, and was degraded from his orders. Nor was Cardinal Beaton satisfied with this more canonical form of procedure: he employed assassins to co-operate in the same design of supporting the church, but his intended victim found shelter and protection in his native county, under the roof of Hugh Douglas of Longniddry, a gentleman who had adopted the same opinions. Here he was retained in the capacity of a domestic tutor; and the son of another protestant, John Cockburn of Ormiston, was likewise committed to his charge. He communicated religious instruction, not only to his pupils, but also to the other members of the family, and to the people of the immediate neighbourhood. He was accustomed to catechise them in a chapel at Longniddry, and there at stated times to read and explain a portion of the Scriptures. When religious instruction was so scanty, and access to the fountain of sacred knowledge so difficult, the services of so faithful a labourer must have been of no small value. About this period, he received a new impulse from the public and private instructions of George Wishart, who returned to his native country in the year 1544. He had been driven into exile by the bishop of Brechin, for the crime of reading lectures on the Greek Testament at Montrose, and during several years had resided in the university of Cambridge. "Excelling all his countrymen at that period in learning, of the most persuasive eloquence, irreproachable in life, courteous and affable in manners, his fervent piety, zeal, and courage in the cause of truth, were tempered with uncommon meekness, modesty, patience, prudence, and charity. In his tour of preaching through Scotland, he was usually accompanied by some of the principal gentry; and the people, who flocked to hear him, were ravished with his discourses. To this teacher Knox attached himself, and profited greatly by his sermons and private instructions. During the last visit which Wishart paid to Lothian, Knox waited constantly on his person, and bore the sword, which was carried before him from the time that an attempt was made to assassinate him in Dundee. Wishart was highly pleased with the zeal of his faithful attendant, and seems to have presaged his future usefulness, at the same time that he laboured under a strong presentiment of his own approaching martyrdom."[1]

Wishart was brought to the stake at St Andrews on the 1st of March 1546, and his persecutor, the blood-stained cardinal, was not long permitted to survive. On the 29th of the ensuing May, he was surprised in his castle by a small and resolute band of conspirators, whom his misdeeds had roused to acts of desperation. Having put him to death, they kept possession of his strong-hold, and procuring assistance from England, they sustained a regular siege from an army collected by the regent Arran. Many protestants, who had no participation in the conspiracy, sought refuge in the castle; and among these were Sir David Lindsay and Henry Balnaves, whose names are familiarly known to all who are acquainted with the literary his-

[1] M'Crie's Life of Knox, vol. i. p. 41, 5th edit. Edinb. 1831, 2 vols. 8vo.

tory of that age. Knox, being among the number of the proscribed, was persuaded by Douglas and Cockburn to follow the example. He was accompanied by his pupils, and continued his religious as well as his literary instructions. In the chapel of the castle, he read lectures on portions of the Scriptures; and so favourable an opinion was formed of his talents and attainments, that he was earnestly solicited to officiate as the colleague of John Rough, chaplain to the garrison. It was not without much reluctance that he obeyed the call; but having undertaken this office, he acquitted himself with equal ability and zeal. He occasionally preached in the parish church, as well as in the chapel of the castle, and the popish clergy were at length roused to some degree of counter-exertion: it was arranged that the most learned men of the abbey and university should every Sunday preach in their turn, partly with the view of excluding the protestant ministers from the pulpit, and partly with that of conciliating the affections of the people, whose edification they had too long disregarded. Knox and his colleague were summoned to a public disputation, held in the presence of Winram the sub-prior, who was vicar-general during the vacancy of the see, and who was secretly inclined to the reformed doctrines. He did not himself enter into much discussion, and he was very feebly supported by a Franciscan friar, named Arbuckle, who was finally driven to the desperate averment "that the apostles had not received the Holy Ghost when they wrote the epistles, but they afterwards received it, and ordained ceremonies." It was more easy for this father to abandon the inspiration of the holy Scriptures, than to relinquish the vain ceremonies of the church: so customary has it generally been for mankind to adore the bungling work of their own hands.

During the short period of his ministrations at St Andrews, many of the citizens renounced the errors of popery, and publicly testified the change of their religious opinions, by partaking of the communion according to the rite of the reformed church. But the protestants could not long retain possession of the castle. At the end of June 1547, a considerable reinforcement arrived from France, and enabled the regent to invest the place by sea and land: the garrison made a brave resistance, but after an interval of a month was reduced to the necessity of accepting terms of capitulation from Leo Strozzi, the commander of the foreign auxiliaries. It was stipulated that their lives should be spared, that they should be removed to France, and that such of them as declined entering into the French service should be conveyed to any other country except Scotland. Rough had previously emigrated to England, and there he suffered martyrdom in the year 1557. Knox, sharing the fate of his companions, was conveyed on board one of the French ships, which cast anchor before Rouen; but the terms of the capitulation were grossly violated, and, at the instigation of the pope and the Scottish clergy, they were treated as prisoners of war. The principal gentlemen were committed to close custody in Rouen, Cherbourg, Brest, and Mont St Michael; while Knox and some others were sent on board the galleys, and after being loaded with chains, were compelled to labour at the oar. Here they were subjected to many other indignities; but in spite of every hardship and every threat, not one of their number could be impelled to renounce his faith. During the ensuing winter, the galley in which he was confined lay in the river Loire; and, in the summer of 1548, it sailed for Scotland, and during a considerable period lingered on the eastern coast, for the purpose of intercepting English vessels. The hardships to which he was now subjected produced a very serious effect upon his health: he was seized with a violent fever, and no hope was entertained of his recovery. He however regained his strength, and during his captivity had sufficient energy of mind to compose more than one religious treatise. His treatise on prayer, written during this season of affliction, was afterwards published. Having endured a captivity of nineteen months, he was restored to liberty in February 1549. Of the circumstances which led to this event, various accounts have been given; but according to Dr M'Crie, "it is more than probable that he owed his deliverance to the comparative indifference with which he and his brethren were now regarded by the French court, who, having procured the consent of the parliament of Scotland to the marriage of Queen Mary to the dauphin, and obtained possession of her person, felt no longer any inclination to revenge the quarrels of the Scottish clergy."

Knox immediately directed his course to England, where his merits and his sufferings were neither unknown nor unregarded. Soon after he made his appearance in London, he received an appointment to officiate at Berwick, where he began to preach with his characteristic fervour and zeal. He exposed the errors of popery with an unsparing hand, and his labours seem to have been attended with no inconsiderable success. The tendency of his zeal was not however calculated to recommend him to the bishop of the diocese, Dr Tonstall, who, although a man of elegant learning, was deeply infected with the ancient superstition. Having been accused of asserting that the sacrifice of the mass is idolatrous, the preacher was cited to appear at Newcastle on the 4th of April 1550, before the bishop of Durham, and to give an account of his doctrine. This prelate was attended by several of his clergy, as well as by various laymen, and a large number of spectators was attracted by the peculiar circumstances of the investigation. Knox entered into a copious defence of his opinions, and with the utmost boldness proceeded to demonstrate that the mass is a superstitious and idolatrous substitute for the genuine sacrament of the Lord's supper. The bishop, though he probably listened with surprize and indignation, did not venture to inflict any ecclesiastical censure; and the fame of the obnoxious preacher was extended by this attempt to restrain the boldness of his attacks on the errors of the falling church. Having remained at Berwick till the close of the year, he was afterwards removed to Newcastle. In December 1551, he was appointed one of King Edward's chaplains in ordinary, with an annual salary of forty pounds, which at that period was no mean provision. The chaplains were six in number; two of whom were to be in constant residence at court, while the other four were employed in preaching in different parts of the kingdom. In the course of this year, the Book of Common Prayer was subjected to a revisal, of which it stood in considerable need; and Knox having been consulted among other divines, was chiefly instrumental in procuring a material alteration in the communion service, which at first was too favourable to the doctrine of the real presence. One deep vestige of this doctrine is still preserved in the kneeling posture of the communicants, which manifestly derives its origin from the popish adoration of the host.

The freedom of his discourses in the pulpit gave offence to various individuals, and among others to the duke of Northumberland, warden general of the northern marches; and having been accused of high misdemeanours, he was cited to appear before the privy council, which at that period possessed an extensive and ill-defined jurisdiction. But the malice of his enemies was altogether ineffectual, and this call to the metropolis was followed by consequences very different from those which they anticipated. He was fully cleared from every imputation of blame; and having been employed to preach at court, he made so favourable an impression on the young king that he expressed his anxiety to promote him in the church. It was resolved by the council that during the following year he should preach in London and the southern counties. Having returned for a short time to Newcastle, he accordingly repaired to the metropolis in the beginning of April 1553. Archbishop Cranmer had previously been directed by the council to present him to the rectory of All-Hallows; but Knox declared that in the existing state of the church he could not conscientiously accept of any preferment. He was again summoned before the council, where he gave an unreserved explanation of his sentiments on that subject. Nor could the promise of much higher promotion induce him to disregard the admonitions of a scrupulous conscience: the king, with the advice of his council, made him an offer of a bishopric; but instead of availing himself of so favourable an avenue to worldly honours, he declared the office of a bishop, as exercised in the English church, to be destitute of divine authority. It is sufficiently evident that he considered that establishment as but imperfectly reformed from the errors of popery; and that, in his estimation, the new prelacy, retaining all the proud trappings, as well as the political character of the old, was very widely removed from the simplicity of an evangelical church. The premature death of the king, on the 6th of July 1553, was fatal to the further progress of reformation, and a cloud of spiritual darkness again overshadowed the land.

During his residence at Berwick, Knox had formed a lasting attachment to Marjory Bowes. Her father was Richard, the youngest son of Sir Ralph Bowes of Streatlam; her mother was Elizabeth, a daughter and coheiress of Sir Roger Aske of Aske. The match was cordially approved by the mother of the young lady, but having been opposed by her father, it was not concluded till after a considerable interval. After the king's death, he had some intention of settling at Berwick, or in the immediate neighbourhood; but he speedily discovered that he could not safely reside in a kingdom ruled by so bigoted and cruel a sovereign. He therefore sailed for France, and landed at Dieppe on the 20th of January 1554. Having lingered there till the last day of February, he pursued his solitary way through France, and arrived in Switzerland; but in the beginning of the ensuing month of May, he retraced his steps to Dieppe with the view of obtaining intelligence from his friends in England. At that period, the intercourse between different countries was slow and precarious; nor was this the only occasion on which he returned to the same place for the same purpose. While he continued to reside on the continent, he received remittances from his friends in Scotland as well as in England, but his provision was neither certain nor ample. Geneva became for some time the chief place of his abode, and here his exile was cheered by the friendship of one of the most illustrious men of the age. Calvin had now attained to the summit of his reputation. They embraced the same opinions with respect to the leading doctrines of the Christian faith, and in their personal character they exhibited several conspicuous points of resemblance. In their notions of ecclesiastical polity they preserved the same agreement; and the authority of Knox, supported by that of Calvin, has contributed to establish in this country a simple mode of discipline and worship, to which our ancestors adhered with unconquerable resolution, and in support of which many of them were found ready and willing to shed their blood.

The leisure which he enjoyed at Geneva was profitably spent in study, to which he devoted himself "with all the ardour of youth, although his age now bordered upon fifty. It seems to have been at this time that he made himself master of the Hebrew language, which he had no opportunity of acquiring in early life." Many pious and learned men had now been driven from England by the unrelenting cruelty of Queen Mary, and most of them sought refuge in the protestant states of Germany and Switzerland. Those who resorted to the imperial city of Frankfort, were allowed the joint occupancy of a place of worship; and it was unanimously resolved to discontinue the use of the surplice, the litany, the audible responses, and some other superfluities which might rather excite the surprize than the approbation of their foreign brethren. Having determined to elect three pastors, they sent a letter of invitation to Knox, subscribed by twenty-one of their number, at the the head of whom stands John Bale, the exiled bishop of Ossory. It was not without some degree of reluctance that he consented to leave his retreat at Geneva; he however repaired to Frankfort in the month of November 1554, and entered upon the duties of his new charge, but his connexion with this congregation proved a source of great uneasiness and mortification. Various dissensions which arose among its members, were chiefly occasioned by a difference of opinion as to the propriety of adhering to the English service; and those dissensions were greatly fomented by Dr Cox, who had been preceptor to King Edward, and who afterwards became bishop of Ely. In the progress of the controversy, Knox appears to have acted with dignity and moderation, but the ardent votaries of the liturgy were not easily diverted from their purpose; for when all other expedients failed, two of their number, with the approbation of others, sought a private interview with the magistrates, and accused him of treason against the emperor Charles, his son Philip, and his aunt the queen of England. This extraordinary charge was founded upon certain passages in his tract published in 1554, under the title of "A Faythfull Admonition unto the Professours of Gods Truthe in England." Of the futility of such an accusation the magistrates were sufficiently aware; but they nevertheless deemed it advisable for him to withdraw from Frankfort, and he availed himself of the suggestion which they conveyed to him. On the evening of the 25th of March 1555, he delivered a farewell discourse to about fifty members of the congregation; and on the following day they accompanied him several miles on his journey. He immediately returned to Geneva, and he experienced a cordial welcome from Calvin. There he continued till the month of August, when he again proceeded to Dieppe; and having embarked in a vessel bound for Britain, he landed near the eastern border of the two kingdoms about the end of autumn. On reaching Berwick, he found his wife and mother living in comfortable circumstances. With them he remained for some time, and afterwards pursued his journey to Edinburgh, where he took up his abode with a citizen named John Syme, to whose house the friends of reformation repaired as soon as they were aware of Knox's arrival.

Notwithstanding the rigour of the penal laws, the votaries of the protestant cause were not entirely extirpated or dispersed. The queen dowager, Mary of Loraine, having succeeded in her attempt to supplant the earl of Arran, had been appointed regent on the 10th of April 1554. She was sufficiently disposed to continue the corruptions of the church, but several prudential considerations restrained her from pursuing more violent measures. Some of the protestants who were driven from England by the atrocities of Mary, a worthy daughter of Henry the Eighth, were permitted to live in Scotland without molestation, and even to meet, though with some degree of privacy, for the purpose of worshipping God according to the dictates of their own conscience. William Harlow, who afterwards became minister of St Cuthbert's, is mentioned as the first preacher who returned from the south at this critical period; and, in different parts of the country, he continued his ministrations till the final establishment of the reformation. His endeavours were ably seconded by John Willock, whom Knox found residing at Edinburgh as an envoy from Anne duchess of Friesland; for he had been entrusted with a commission for arranging the commercial relations between the two countries. He was born in Ayrshire, and had originally been a Franciscan friar; but speedily quitting his monastery and renouncing the mass-book, he sought refuge in England, where he was appointed chaplain to the duke of Suffolk. After the death of the young king, he was again compelled to change his place of residence, and he then settled in the town of Embden, and followed the practice of physic. He thus became known to the duchess, who was favourably inclined to the reformation of religion; and his mission to his native country afforded him peculiar opportunities of promoting that cause in which he felt so deep an interest. He became known to the leaders of the protestant party, who privately resorted to him from the desire of religious edification. At this period, few individuals had openly renounced the Romish creed; and of those who were most inclined to the protestant doctrines, very few had ventured to discontinue their attendance at mass. Knox was deservedly scandalized at this want of firmness and consistency: a meeting, attended by William Maitland of Lethington and other leaders of the party, was held for the avowed purpose of discussing the lawfulness of such compliances; and Knox succeeded in his attempt to convince them that all participation in the worship of the Romish church was to be avoided by those who were convinced of her gross errors. Nor were his exertions confined to the metropolis. He accompanied John Erskine of Dun to his seat in the neighbourhood of Montrose; and during a visit of a month he preached every day, being attended by the principal persons of the adjacent district. On his return to the south, we find him residing at Calder-house, the seat of Sir James Sandilands, afterwards Lord Torphichen, an early, zealous, and consistent friend of the reformation. In the hall of this baron, who was preceptor in Scotland of the knights of St John of Jerusalem, he preached and administered the communion. Here his ministrations were attended by several persons of distinction; and among these were Archibald, Lord Lorne, afterwards earl of Argyle, John, Lord Erskine, afterwards earl of Mar, and James Stewart, prior of St Andrews, afterwards earl of Moray; all of whom received religious impressions which influenced the future course of their lives. Early in the subsequent year, 1556, he was accompanied to the district of Kyle by Lockhart of Bar and Campbell of Kineancleuch. This division of Ayrshire had been the principal seat of the Lollards in Scotland, and it then contained many friends of the purer religion. They were not therefore unprepared for his reception: he preached not only in the town of Ayr, but likewise in the houses of Bar, Kineancleuch, Carnell, Ochiltree, and Gadgirth, and in several of these places the holy communion was now dispensed. Before Easter, he paid a visit to Finlayston, the residence of Alexander earl of Glencairn, one of the most strenuous friends of the reformation. In this baronial castle he also preached and administered the sacrament. Returning to Calder-house, he next determined to visit his friends in the north; and during his second residence at Dun, he was emboldened to preach in a more public manner. Many gentlemen of that vicinity made an open profession of the reformed faith; and, in order to strengthen their cause, they entered into a solemn engagement to renounce the communion of the popish church, and, to the utmost of their ability, to promote the pure preaching of the gospel. "This," says Dr M'Crie, "seems to have been the first of those religious bonds or covenants, by which the confederation of the protestants in Scotland was so frequently ratified."

As he now begun to preach more openly, the ecclesiastics felt a natural alarm for the safety of a tottering church; and the friars testified their zeal by urging the bishops to proceed with rigour against such an offender. He was accordingly cited to appear before an assembly of the clergy, to be held at Edinburgh in Blackfriars church, on the 15th of May; but when they found that he did not shrink from this discussion, and that he was supported by some persons of influence, they sought a pretext for superseding the citation, on the ground of its informality. On the very day which had been appointed for his appearance, he preached in the bishop of Dunkeld's house to a much larger auditory than had previously attended him in Edinburgh; and during the ensuing ten days, he regularly preached twice a-day in the same place, without being exposed to any molestation. About this period the Earl Marischal attended one of his evening discourses; and it may be regarded as a proof of his favourable impression that he united with the earl of Glencairn in an earnest request, that Knox would address to the queen regent such a letter as might induce her to extend her protection to the protestant preachers. A letter was accordingly addressed to her, and it was delivered by the earl of Glencairn, but it does not appear to have produced any change in her sentiments. This letter he afterwards published, with some additions. In the mean time he received from the English congregation at Geneva an invitation to become one of their pastors. He readily listened to their call, and made arrangements for removing thither, accompanied by his wife, as well as by her mother, who had now lost her husband. He embarked them on board a vessel bound for Dieppe, and paid another visit to the several places where he had disseminated the truth of the gospel. He visited the earl of Argyle at Castle Campbell, and there he repeatedly preached to such an auditory as could be assembled. Having thus made no inconsiderable progress in preparing his countrymen for a more general reception of the reformed doctrines, he took his leave in the month of July 1556, and joining his family at Dieppe, he again directed his course to Geneva. His colleague in his new office was Christopher Goodman, B.D., an Englishman, who afterwards became a clergyman of the church of Scotland.[1] Their congregation chiefly consisted of the exiles who had withdrawn from Frankfort in consequence of the dissensions already mentioned. The two pastors lived together on terms of the greatest cordiality. Knox likewise enjoyed the friendship of Calvin and Beza; and the two years which he spent in this vocation are described as the most tranquil of his public life. At this period was published a directory for worship and discipline, frequently described as the Order of Geneva; but it had been composed at Frankfort by Knox, Whittingham, Fox, Gilby, and T. Cole. The same directory was afterwards adopted by the reformed church of Scotland.[2]

When the Scotish clergy were apprized of his having

[2] The Forme of Prayers and Ministration of the Sacraments, &c. vsed in the Englishe Congregation at Geneua, and approued by the famous and godly learned man, Iohn Caluyn. Imprinted at Geneva by Iohn Crespin, 1556, 8vo. This part of the volume consists of 93 pages; which are followed by "One and fiftie Psalmes of David in Englishe metre, wherof 37 were made by Thomas Sternehold, and the rest by others. Conferred with the hebrewe, and in certeyn places corrected as the text and sens of the Prophete required." Next follows "The Catechisme, or manner to teache children the Christian religion, wherin the Minister demandeth the question, and the childe maketh answere. Made by the excellent Doctor and Pastor in Christes Churche, Iohn Caluin." The first Scotish edition, which contains some modifications and considerable additions, bears the subsequent title: "The Forme of Prayers and Ministration of the Sacraments, &c. vsed in the English Church at Geneua, approued and receiued by the Churche of Scotland: whereunto besydes that was in the former bokes, are also added sondrie other prayers, with the whole Psalmes of Dauid in English meter." Printed at Edinbvrgh by Robert Lekprevik, 1565, 8vo. The Catechisme has a separate title, bearing the date of 1564. Of this work there are many other editions, several of which were printed in Holland. One edition is entitled

quitted the kingdom, they renewed the citation for his appearance; and those who had no inclination to encounter such a disputant, now found themselves at liberty to proceed against him as a contumacious heretic. He was accordingly condemned to suffer death by fire; and as the sentence could not be executed on his person, it was executed on his effigy, which was in due form committed to the flames at the cross of Edinburgh. From this sentence he prepared an appeal, which was afterwards printed under the title of "The Appellation of John Knoxe from the cruell and most unjust sentence pronounced against him by the false Bishoppes and Clergie of Scotland." In the course of the year which followed his return to Geneva, two citizens of Edinburgh, James Syme, and James Baron, were the bearers of an invitation for him to resume his evangelical labours in his native country. They were furnished with credentials from the earl of Glencairn, and the lords Erskine, Lorne, and James Stewart. After consulting Calvin and the other ministers of Geneva, he determined to devote himself to this honourable and dangerous service; and he again pursued his way to Dieppe, where he arrived in October 1557. He had however the mortification of receiving letters which entirely disconcerted his plan; for he was informed that some of the protestants already repented of the invitation which had been sent to him, and that the great body of them seemed to waver in their purpose. He lost no time in addressing a letter to the noblemen who had subscribed the credentials; and it may easily be supposed that he did not fail to upbraid them for their want of firmness and consistency. In a similar strain, he likewise wrote to Erskine of Dun, Wishart of Pittarow, and to some other individuals of the protestant party. He lingered in France to await the course of events; and as he was familiarly acquainted with the French tongue, his talents as a preacher were not in the mean time unemployed. About this period, he paid a visit to Lyon, and he is known to have preached at Rochelle. A protestant congregation had recently been formed at Dieppe; and he was now elected one of its pastors, being associated with Delaporte. So successful were their exertions, that some of the principal persons of the town were induced to renounce popery, and a general improvement began to be produced in the morals of the inhabitants. Discouraged by the aspect of affairs in Scotland, he at length determined to revisit Geneva, where he again made his appearance in the beginning of the year 1558. It was at this period that some of the most learned members of his congregation were engaged in preparing an English version of the Bible, and he is said to have had some share in so laudable an undertaking.[1] The New Testament was printed at Geneva in 1557, and the entire Bible in 1560. This version, commonly called the Geneva Bible, is allowed by competent judges to possess great merit; and, in the opinion of Dr Geddes, it is generally superior to the version executed under the authority of King James. Of the former version, says Dr M'Crie, it is evident that his translators made great use; "and if they had followed it still more, the version which they have given us would, upon the whole, have been improved."

In the course of the year 1558, Knox published three different works. One of these was the Appellation. Another, which has also been mentioned in a former page, was "The copie of a Lettre delivered to the Ladie Marie, Regent of Scotland." The third and most remarkable of these tracts bears the title of "The first Blast of the Trumpet against the monstruous Regiment of Wemen." This anonymous work, directed against the political government of females, attracted a very considerable degree of attention. It was speedily answered by John Aylmer, who in due time became bishop of London. The doctrine of Knox as to the inexpediency of female rule was afterwards controverted by David Chalmers of Ormond, and by John Lesley, bishop of Ross. Whatever opinion may be formed of his theory, it must at least be admitted that, either in England or Scotland, he had seen nothing to reconcile him to the practice; and, in one of those countries, the regimen of a woman might with too much justice be termed monstrous. His literary labours were interrupted by the renewal of an invitation from the Scotish protestants; and at the beginning of the year 1559, he bade a final adieu to Geneva, having previously been presented with the freedom of the city. Leaving his family behind, he once more proceeded to Dieppe, where he arrived in the month of March; and having ascertained that he would not be permitted to pass through England, he embarked for Leith on the 22d of April, and was safely landed on the 2d of the following month.

The popish church of Scotland was now approaching its crisis, which the presence of Knox had no small tendency to hasten. The queen regent, who for some time thought it necessary to dissemble her real sentiments, had lately evinced a fixed resolution to oppose the reformation with all the weight of her authority; and the fires of persecution had been rekindled by Hamilton, the profligate archbishop of St Andrews. Walter Mill, a venerable priest, who had attained the age of eighty-two, was brought to the stake on the 28th of August 1558. This atrocious execution had such an effect in rousing the popular indignation, that the dread of the civil or ecclesiastical authority could no longer restrain the people from making an open avowal of their adherence to the reformed doctrines; while their spiritual guides, Harlow, Douglas, Methven, and a few others, began, with less fear of detection, to preach and to administer the sacraments. In the month of October, Willock again returned from Embden, and brought a new accession of talent and zeal. The death of the English queen, which took place on the 17th of November 1558, was another event that produced considerable influence on the affairs of the neighbouring states. The queen regent was however prepared to adopt the most violent measures. Several of the preachers, Willock, Harlow, Methven, and Christison, were cited to appear at Stirling before the high court of justiciary on the 10th of May, that is, eight days after Knox's return; and very soon after his arrival had been announced to Mary, he was proclaimed a rebel and an outlaw. The four preachers were outlawed for non-appearance, and a fine was levied on their sureties. After remaining a single day in the metropolis, he hastened to Dundee, where the chief protestants of Angus and Mearns were then assembled. They proceeded to Perth, and there he preached a sermon against the idolatry of the mass and of image-worship. After the conclusion of the service, a riot was casually excited among the common people; and, before it was terminated, the monasteries of the Dominican and Franciscan friars, with that of the Carthusian monks,

---

"The CL. Psalmes of David in prose and meeter: with their whole vsuall Tunes, newly corrected and amended. Herevnto is added the whole Church Discipline, with many godly Prayers, and an exact Kalendar for xxv. yeeres: and also the Song of Moses in meeter, neuer before this time in print." Edinburgh, printed by Andro Hart, anno 1615, 8vo. Instead of Calvin's Catechism, this edition includes "A Catechisme of Christian Religion. Appointed to be printed for the vse of the Kirke of Edinbvrgh." A more recent edition bears the title of "The Psalmes of David in prose and meeter: with their whole Tunes in foure or mo parts, and some Psalmes in Reports. Whereunto is added many godly Prayers and an exact Kalendar for xxv. yeeres to come." Printed at Edinburgh by the Heires of Andrew Hart, anno Dom. 1635, 8vo.

Knox.

were totally demolished. The queen, who was probably glad of such a pretext, collected a considerable army, and advanced upon Perth; but she found the protestants so well prepared for resistance, that she did not hazard an attack. She proposed and ratified terms of accommodation, which she speedily shewed a strong disposition to disregard. In order to ascertain the strength of their party, and to consolidate its union, they formed a religious bond or covenant, which received many signatures in different parts of the kingdom. From this period, they began to be distinguished by the name of the Congregation, and their noble leaders were commonly described as the Lords of the Congregation.

On his return from Perth, he preached at Anstruther and Craill. Disregarding the admonitions of his friends, and the threats of the archbishop, he next preached in the cathedral of St Andrews, having selected the appropriate subject of our Saviour's driving the profane traders from the holy temple. On the three ensuing days he lifted up his warning voice in the same place; and so signal was the success which attended his efforts, that the magistrates and the inhabitants resolved to establish the reformed worship in that city; the pictures and images were removed from the churches, and, on the 14th of June, the monasteries were defaced. He reached the capital in the end of the same month: on the day of his arrival he preached in St Giles's, and on the following day in the Abbey church. On the 7th of July, the body of the protestant inhabitants of Edinburgh elected him as their minister, nor did he decline the invitation. His wife followed him from Geneva; and her mother, after visiting her relations in England, likewise came to end her days in Scotland. But he was soon disturbed in his new functions, in consequence of the military occupation of the city by the troops of the queen regent. He now made an extensive circuit in the southern and eastern districts of the kingdom, visiting Kelso, Jedburgh, Dumfries, Ayr, Stirling, Perth, Brechin, Montrose, Dundee, and St Andrews; nor can we doubt that the impressions produced by such a missionary were great and beneficial. After this period he was deeply engaged in the political as well as the ecclesiastical transactions of the Congregation; and the vigour of his talents, with the decision of his character, was conspicuously displayed in the steps which led to the establishment of the reformed religion. Knox, as well as Willock, concurred in advising the suspension of Mary from the office of regent. For the space of twelve months, the kingdom was infested with a civil war, in which French and English troops supported their respective allies. The contest, which had not been marked by many of the usual atrocities of intestine warfare, terminated in the month of July 1560. Parliament soon afterwards assembled; and in the course of a few days the reformed religion was established by the authority of the legislature.

Knox, after officiating for several months at St Andrews, had returned to Edinburgh at the end of April, and continued to exercise his functions during the siege of Leith. Before the close of the year, he was visited with a severe domestic affliction in the loss of his wife, who left two children of tender years. The young queen returned from France on the 21st of August 1561. Not many days after her arrival, she sent for the reformer, of whose powerful influence she must have been fully aware; but neither this nor any of their subsequent interviews produced the effects which she seems to have anticipated. Such topics as Mary introduced he discussed with undaunted freedom, though it cannot with justice be affirmed that he treated her with incivility. She certainly did not overawe him with her royal presence, or render him less disposed to use his utmost endeavour in destroying the fabric of ancient superstition. The Scottish reformation differed in many respects from that of the neighbouring kingdom. In the one case, the most essential trappings of a proud popish prelacy were left uncurtailed, nor was the church sufficiently purified from popish devices and observances.[1] The sign of the cross in baptism, with the entire apparatus of godfathers and godmothers, some part of the funeral service, kneeling at the communion, the power of the priest to remit or to retain sins, and the power of the bishop to confer the gift of the Holy Ghost, ought to have been left in the sole and undisputed possession of those who still adhere to the mass and transubstantiation. Queen Elizabeth, the head of the church, was deeply tinctured with popery; insomuch that she was dissatisfied with the twenty-ninth article, as implying a denial of the doctrine of the real presence. She reluctantly permitted the crucifix and tapers to be removed from the altar in her chapel. It seems to have been by her private authority that a clause, unsanctioned by the convocation, was added to the twentieth article;[2] a clause which makes the averment that " the church hath power to decree rites

[1] The genuine high-churchmen seem to feel some lingering regret for the discontinuance of the popish prayers for the dead. " In truth," says Mr Waddington, " to pray for the souls of our departed friends is the most natural and pardonable error of piety; and although it be dangerous and improper to inculcate as a church doctrine the efficacy of such prayers, it would neither be right to discourage their private and individual effusion, nor easy to disprove the possibility of their acceptance." (Present Condition and Prospects of the Greek or Oriental Church, p. 37. Lond. 1829, 8vo.) " Some persons," remarks Mr Palmer, " will perhaps say that this sort of prayer is unscriptural; that it infers either the Romish doctrine of purgatory, or something else which is contrary to the revealed will of God, or the nature of things. But when we reflect that the great divines of the English church have not taken this ground, and that the church of England herself has never formally condemned prayers for the dead, but only omitted them in her liturgy, we may perhaps think that there are some other reasons to justify that omission." (*Origines Liturgicæ*, or Antiquities of the English Ritual, vol. ii. p. 94. Oxford, 1832, 2 vols. 8vo.) This work, which is learned and curious in its way, might with a considerable degree of propriety have been entitled " The Conformity of the Church of England with the Church of Rome." Among other important facts, he is pleased to state that " the bishops who rule the churches of these realms were validly ordained by others, who by means of an unbroken spiritual descent of ordinations derived their mission from the apostles, and from our Lord. This continual descent is evident to any one who chooses to investigate it. Let him read the catalogues of our bishops ascending up to the most remote period. Our ordinations descend in a direct unbroken line from Peter and Paul, the apostles of the circumcision and the Gentiles. These great apostles successively ordained Linus, Cletus, and Clement, bishops of Rome; and the apostolical line of succession was regularly continued from them to Celestine, Gregory, and Vitalianus, who ordained Patrick bishop for the Irish, and Augustine and Theodore for the English. And from those times an uninterrupted series of valid ordinations have carried down the apostolical succession in our churches, even to the present day. There is not a bishop, priest, or deacon amongst us, who cannot, if he pleases, trace his own spiritual descent from Saint Peter and Saint Paul." (Vol. ii. p. 249.) To this last assertion it is only necessary to oppose another; namely, that there is not a single bishop, priest, or deacon, who can trace his own spiritual origin for one half of the requisite period. But what advantage could possibly result from their tracing it with the utmost certainty? Till they make an unequivocal display of their miraculous powers, we must totally disregard their extraordinary pretensions. By arguments equally logical and cogent, the bishop of Rome undertakes to prove that he inherits all the spiritual gifts and graces of St. Peter, and to these is fully entitled to add all the temporal power and possessions to which he can extend his impious hand. This delirious dream of apostolical succession is disgraceful to the protestant name; and all those whom it bewilders would best maintain their consistency by returning to the bosom of their mother chruch.

[2] See Archdeacon Blackburne's Confessional, p. 368, and Dr Lamb's Historical Account of the thirty-nine Articles, p. 33. Cambridge, 1829, 4to.

 or ceremonies, and authority in controversies of faith." The king or queen superseded the pope as head of the church; and thus a protestant body might have, and in more instances than one has actually had, a popish head. Pluralities and non-residence, two manifest remnants of popery, have been closely interwoven with an establishment, in which the idle splendour of one class of ecclesiastics is placed in so indecent a contrast with the laborious poverty of another.[1]

At this period, the metropolis of Scotland contained only one parish church. Knox was at first assisted by a reader, named John Cairns. It was then his regular practice to preach twice every Sunday, and thrice on other days of the week; but in the year 1563, John Craig, minister of Canongate, was appointed his colleague. In 1562, he had for three successive days been engaged at Maybole in a public disputation with Quintin Kennedy, abbot of Crossragwell; and in the course of the following year, an account of it was printed at Edinburgh, under this title: "Heir followeth the coppie of the Ressoning which was betuix the Abbote of Crosraguell and John Knox." Another learned catholic, Ninian Winzet, addressed to him a "Buke of fourscoir thre Questionis," to which it was his intention to publish an answer, though he seems to have been prevented by his other avocations, which were sufficiently numerous. After this period he incurred the hot indignation of the queen for having, in one of his public discourses, animadverted with great freedom on her intended marriage. During one of their interviews, she wept bitter tears of anger; and some modern historians have been not a little scandalized at his want of gallantry. In the month of December 1563, he was summoned before the privy council on a charge of high treason, for having written a circular letter to the protestant gentlemen, in reference to the trial of two persons who had been indicted for a riot in the chapel royal. Of this charge he was fully acquitted, to the great disappointment of Mary and the popish party.

After having continued a widower for more than three years, he married Margaret Stewart, daughter of the good Lord Ochiltree. This marriage took place in March 1564, when he had attained the age of fifty-nine. The noble family with which he thus became connected was descended from Robert duke of Albany, second son of King Robert the Second. Knox was again brought before the privy council, for having, in a sermon preached in St Giles's on the 19th of August 1565, used certain expressions, or rather quoted certain texts, which gave great offence to the king, who was present, and applied them to himself. He was for a short time prohibited from preaching. Early in the following year, Mary subscribed the catholic league for the extirpation of the protestants; and if she had not been controlled by several prudential considerations, she seemed sufficiently prepared to adopt extreme measures. When she returned from Dunbar, soon after the death of Rizzio, he retired from Edinburgh, and sought refuge in Kyle; nor does he appear to have resumed his pastoral care till after the final overthrow of her authority. Towards the close of the year he prepared to visit England, where his two sons were residing with some of their mother's relations for the purpose of receiving their education. He appears to have returned home soon after the queen had plunged herself into ruin by her marriage with Bothwell. He was a member of the general assembly convened at Edinburgh on the 25th of June 1567; and he preached a sermon at the coronation of the young king, which took place at Stirling on the 29th of the ensuing month. The assassination of the regent Moray, and the civil troubles which ensued, depressed his mind and affected his health: in October 1570 he felt a stroke of apoplexy, which however was of so mitigated a kind that he was able to appear in the pulpit; but his strength was greatly impaired by his unceasing exertions, and he never recovered any considerable degree of vigour. Before the end of that year, the freedom of his animadversions in the pulpit gave such deep offence to Kircaldy, governor of the castle, that at length he found it expedient to change his habitation. He quitted the metropolis on the 5th of May 1571, and retired to St Andrews, the scene of his early labours. Here in the following year he published "An Answer to a Letter of a Jesuit named Tyric." In a state of great debility he returned to Edinburgh towards the end of August 1572; and on the 24th of November he closed his most laborious and most honourable career, after having attained the age of sixty-seven. He left two sons by the first, and three daughters by the second marriage. Both his sons studied at St John's College, Cambridge, and both of them became fellows. Nathaniel, the elder of the two, took the degree of A. M., and died in the year 1580. Eleazer, the younger son, proceeded B. D., and was one of the preachers of the university. Having been collated to the vicarage of Clacton-Magna, he died in 1591, and was buried in the college chapel. The three daughters, named Martha, Margaret, and Elizabeth, were married to three clergymen, James Fleming, Zachary Pont, and John Welsh. The widow of Knox became the wife of Sir Andrew Ker of Fadounside, who is described as a strenuous supporter of the reformation.

The vigorous and ardent mind of Knox was lodged in a diminutive and feeble body, which had been wasted by various hardships, and by intense mental exertion. His natural talents were improved by no mean attainments of learning, and he was eminently distinguished by an impetuous and impressive eloquence, which gave him a great ascendency among his countrymen. That he was a man of fervent and habitual piety, will not be disputed by any one whose prejudices do not prevent him from forming a correct estimate of his character. From an early period of his life, he devoted his entire energies to the best of all causes; and, in the hand of Providence, he was the great instrument which rescued his countrymen from the fangs of papal tyranny and superstition; nor is any other name entitled to be mentioned with equal honour in the annals of Scottish history. Of civil as well as ecclesiastical tyranny he was a decided enemy; and his writings contain some bold speculations on the subject of government. No man was more upright in his intentions, or more disinterested in his motives. That the impetuosity of his character occasionally impelled him beyond the bounds of moderation may be fully admitted without any diminution of the re-

[1] Bishop Lowth has stated that "there were some in England who, by the pope's authority, possessed at once twenty ecclesiastical benefices and dignities, with dispensation moreover for holding as many more as they could lawfully procure, without limitation of number." (Life of William of Wykeham, Bishop of Winchester, p. 28, 3d edit. Oxford, 1777, 8vo.) In what protestant country, except England and Ireland, is the system of pluralities and non-residence maintained to any extent? They are an intolerable nuisance, which even there must very speedily be abated. Even the regius professor of divinity at Oxford is convinced that there is a great and general "demand for church reform;" and as Dr Burton is a man of sense as well as learning, he must likewise be aware that, when there is a great and general demand for any commodity, it can in most cases be supplied. His notions of reform, as the reader may easily conjecture, are not extravagant; and some of his suggestions are not deficient in worldly wisdom. It is notorious, as he avers, that many clergymen enjoy the income of their benefices, because the presentations have been bought and sold; and "if any legislative enactment should reduce their incomes, the patrons must in all fairness refund part of the purchase money." (Thoughts upon the Demand for Church Reform, p. 38. Oxford, 1831, 8vo.) All the lay-dealers in such articles must therefore perceive the dangerous tendency of a reform in the church.

spect due to his name: he was placed in a situation which required great energy and decision; and a person chiefly distinguished by the gentler virtues, would have been very indifferently prepared to encounter the boisterous elements with which he was destined to contend. It is not to be concealed that he was not exempted from that spirit of intolerance which, in a greater or less degree, belonged at that period to every sect and denomination of Christians. He was as little disposed to tolerate the mass as the mass-priests were to tolerate those whom they termed heretics. The principles of mutual toleration were little understood or relished; and almost every one who possessed the power betrayed the inclination of imposing, by very ungentle means, his own creed upon his neighbours.

Beside the works which have already been mentioned, he composed various others, which are accurately enumerated by his biographer. "His practical treatises," says Dr M'Crie, "are among the least known, but most valuable, of his writings. In depth of religious feeling, and in power of utterance, they are superior to any works of the same kind which appeared in that age. The thoughts are often original, and always expressed in a style of originality, possessing great dignity and strength, without affectation or extravagance." The work by which he is best known as an author is "The Historie of the Reformatioun of Religioun within the Realm of Scotland." So early as the year 1586, an octavo edition of it, to the extent of twelve hundred copies, was undertaken in England by Vautrollier, a well-known printer; but when ready, or nearly ready for publication, it was seized by the command of Archbishop Whitgift. Some imperfect copies, all of them wanting the beginning and the end, have however survived this visitation of the protestant inquisitor. An edition was afterwards published by David Buchanan, who has taken very unwarrantable liberties with the text. Lond. 1644, fol. Edinb. 1644, 4to. He has suppressed various passages, and interpolated others; and the fifth book, which has not been found in any manuscript, is perhaps his sole composition. A genuine edition, "taken from the original manuscript in the university library of Glasgow," was at length published by Matthew Crawford, professor of ecclesiastical history in the university of Edinburgh. Edinb. 1732, fol. A collective edition of his works, executed with fidelity and elegance, might be preferable to any monument of bronze or marble that could be erected to the memory of this great benefactor of his native country. (x.)

KNUTSFORD, a town of the county of Chester, in the hundred of Bucklow, 173 miles from London. It stands on the river Birken, is the place where the sessions for the county are held, and has a well-attended market on Saturday. The principal employment is in the cotton manufacture. It is an ancient town, said to have been in existence in the time of the Danish king Canute, who gained a victory, and gave its name, Canute's Ford, to the place where his army passed. The inhabitants amounted in 1801 to 2052, in 1811 to 2114, in 1821 to 2753, and in 1831 to 2823.

KODIAK, an island on the west coast of North America, about fifty miles from the entrance into Cook's Inlet. It is about sixty miles in length, and, along with the smaller island of Atognak, is separated from the continent by the Straits of Cheligoff. The natives are robust, active, and well skilled in all the arts connected with fishery. They have an ingenious manner of constructing their boats, which are almost entirely covered with leather. The port of St Paul's on this island was long the chief seat of the trade of the Russians with north-western America. The natives having been found extremely serviceable, were removed in great numbers to the other Russian settlements along the coast.

KOEI-TCHOO, a province of China, situated near the south-western extremity of the empire, bordering on Yunan. It is of a much more unequal surface than the rest of the empire, and full of precipitous mountains, inhabited by barbarous and independent races, from whom the Chinese emperor is scarcely able to collect the moderate tribute which he exacts, even by the aid of all the forts and garrisons which he is obliged to maintain. The mountains yield gold, silver, copper, and mercury. Sir George Staunton estimates the population at 9,000,000.

KOEI-TCHOO-FOU, a city of China, of the first rank, in the province of Setchuen. It is situated on the great river Yang-tse-kiang, and has a very extensive trade. The neighbouring country is mountainous, but is highly cultivated, and abounds in fruit. Long. 109. 50. E. Lat. 31. 9. N.

KŒMPFER, ENGELBERT, was born in 1651 at Lemgow, in Westphalia. After studying in several towns, he went to Dantzig, where he gave the first public specimen of his proficiency, in a dissertation *De Majestatis Divisione.* He then went to Thorn, and thence proceeded to the university of Cracow, where he took his degree of doctor in philosophy; after which he went to Königsberg in Prussia, and staid there four years. He next travelled into Sweden, where he soon began to make a figure, and was appointed secretary of the embassy to the sophi of Persia. He set out from Stockholm with the presents for that emperor, and went through Aaland, Finland, and Ingermanland, to Narva, where he met Mr Fabricius the ambassador, who had been ordered to take Moscow in his way. The ambassador having ended his negotiations at the Russian court, set out for Persia. During their stay two years at Ispahan, Dr Kœmpfer, whose curious and inquisitive disposition suffered nothing to escape him unobserved, took all the advantage possible of remaining so long in the capital of the Persian empire. When, towards the close of 1685, the ambassador prepared to return into Europe, Dr Kœmpfer chose rather to enter into the service of the Dutch East India Company, in quality of chief surgeon to the fleet, then cruising in the Persian Gulf. He went on board the fleet, which, after touching at many Dutch settlements, reached Batavia in September 1689. Dr Kœmpfer here applied himself chiefly to natural history. From Batavia he set out for Japan, in quality of physician to the embassy which the Dutch East India Company send once a year to the Japanese court. He quitted Japan to return to Europe in 1692. In 1694 he took his degree of doctor of physic at Leyden; on which occasion he communicated, in what are called *Inaugural Theses,* ten very singular and curious observations made by him in foreign countries. He intended to digest his memoirs into proper order, but was prevented by being made physician to the Count la Lippe. He died in 1716. His principal works are, 1. *Amœnitates Exoticæ,* in 4to, a work including many curious and useful particulars in relation to the civil and natural history of the countries through which he passed; 2. *Herbarium Ultra-Gangeticum;* 3. The History of Japan, in German, for which the public is indebted to Sir Hans Sloane, who purchased for a considerable sum of money all our author's curiosities, both natural and artificial, as likewise all his drawings and manuscript memoirs, and prevailed on Dr Scheuchzer to translate the Japanese history into English.

KOHCRAAN, a district of Hindustan, in the north-western quarter of the province of Lahore, situated between the thirty-third and thirty-fourth degrees of north latitude, on the western side of the Jhylum or Hydaspes River. It contains no town of note, and the face of the country is extremely hilly and wild, possessed by petty chiefs, who are tributary either to the Sciks or Afghans.

KOKAUN, an independent state of Asia, which is separated from Buckharia on the east by steep and inaccessible mountains; on the south it has the mountainous tract which divides it from Buduckshang and Chitral; on the south-west it is confined by Kurratageen; on the east and north-east by the mountains inhabited by Kirgeesh and Kuzaks, tributary to China; on the north-west by the district of Tashkund, lately reduced under its authority, with mountains and deserts. This kingdom is divided into thirteen districts, all of which contain towns more or less considerable. The river Sihoon or Jaxartes, which takes its rise about four days' journey south-east of Kokaun, divides the country into two parts. The territory of Kokaun is 200 miles in length by about 150 miles in breadth. The general description of the country is mountainous, divided by valleys and plains, of which those near the river Sihoon and its tributary streams are rich and fertile, and those more removed comparatively arid and sterile. Many villages, and a good deal of cultivated ground, are scattered over its surface; and many places afford rich pasture for the flocks and herds of the tribes who wander over it. The inhabitants are chiefly Uzbecks, who are shepherds, and a few Tanjeks, who live in villages, and are described by Fraser[1] as a stout, fat, fair, and high complexioned people, extremely quiet, good humoured, merry, and hospitable. They are fond of active pursuits, such as riding, hunting, hawking, and are more addicted to intemperance. There are many other wandering tribes in Kirgeesh, &c. scattered over the face of the country. The winter is severe, though there is but little snow. The summer is very hot and parching, and there is not much rain till towards the end of autumn. They produce a great deal of silk in the country, which is manufactured into various fabrics. Mulberry trees are planted round all the fields, and cotton is also much cultivated. Willows, poplars, cypresses, with all kinds of fruits known in Europe, are common here. Sycamores are rare, but the hills are covered with lofty pines, poplars, almond, walnut, and pistachio trees. The name of the capital is Kokaun, which was formerly a petty village; but, by becoming the seat of government, it has increased so much that it now contains more than 50,000 houses. It has no wall, and water has been introduced into most of the streets from the river Jaxartes, upon the bank of which it is situated. The women of the towns and villages are concealed, like those in other Mahommedan states, and wear veils from head to foot. A journey was undertaken in 1813 by M. Nazaroff, a Russian, who travelled with the tracking caravans, and, crossing the deserts, penetrated as far as Kokaun or Khokand, where he was exposed to danger from the jealousy of the chiefs, and the fanatical hatred of the people. He was at last permitted to return to his own country.

KOLIN, a city of the circle of Kaurzim, in the Austrian kingdom of Bohemia. It is on the banks of the Elbe, contains 416 houses, and 4387 inhabitants, who are employed in cotton weaving, and in iron manufactures. Near to it is the field of battle where, in 1757, Daun defeated Frederick of Prussia.

KOLLBERG, a city of Prussia, in the province of Pomerania, and the circle of Koslin. It is on the river Persante, about one mile from its entrance into the Baltic. It has some foreign trade, and considerable establishments for building ships; and near to it are some extensive salt-works, belonging to the crown. It contains four churches, 780 houses, and 7950 civil inhabitants, besides a garrison. It is chiefly remarkable for the strength of its position, and for its fortifications. It stands on a hill surrounded with morasses; and the broad ditches can be with ease filled with water from the river Persante. A strong citadel commands the city and the entrance from the sea, and it has several strong out-works.

From its importance as a landing-place, it has been frequently attacked. The Russians besieged it in 1758, but were repulsed. In 1760, it was attacked by a combined fleet of Russian and Swedish ships and 15,000 land troops, but it was relieved by General Werner. Again, in the next year, it was attacked by the Russian general Romanzoff, with fifty-five ships of war and a powerful land force. It was ably defended during four months, and the Russians lost more than 3000 men in the trenches; but at length, from want of provisions, it capitulated on the 16th December.

The most distinguished defence was that in 1807, when most of the other strong places in Prussia had surrendered to the invading armies of Bonaparte. It was attacked by 18,000 men, commanded by Loisson, and defended by 6000 Prussians, including volunteer inhabitants. After a siege with constant bombarding, in which the greater part of the city was destroyed, it surrendered, having lost 1900 men. General Gniseneau, who commanded on this occasion, first displayed his high military talents. Long. 15. 32. N. Lat. 54. 7. E.

KOLOMEA, a circle of the Austrian kingdom of Galicia, extending over 1263 square miles, and comprehending three cities, twelve market-towns, and 204 villages, containing 30,618 houses, with 156,614 inhabitants, of whom 11,700 are Jews. It is an agricultural district, yielding corn and flax in the level parts; but a large portion of it is mountainous and barren. The capital is the city of the same name situated on the river Pruth, with a Greek and a Catholic church, and 1890 inhabitants.

KOLUMNA, a circle in the Russian province of Moskwa, which extends over 662 square miles, comprehending one city and 269 parishes, with 65,650 inhabitants. The capital is the city of that name, on the river Kolomenka, which runs to the Moskwa. It contains a cathedral and sixteen other churches, with 1150 houses, mostly of wood, and 6340 inhabitants. There is much tallow and leather produced, and there are manufactures of linen, silk, and cotton goods. Long. 38. 25. E. Lat. 55. 20. N.

KOLYVAN, a province of Asiatic Russia, in the government of Tomsk, situated on the upper course of the Obi. It is chiefly distinguished by the abundant copper mines within its limits, containing a considerable proportion both of silver and gold. These mines were discovered in 1727 by M. Demidoff, who, when he began to work them in 1730, publicly extracted the copper, but was obliged clandestinely to separate the gold. This fraud being discovered by a German, the mines were confiscated to the use of the government; and, according to the accounts of the board of mines, these works, from 1725 to 1786, produced about 3,500,000 pounds of silver, and 48,000 pounds of gold. The town of Kolyvan is small, situated on the right bank of the Berda, near its junction with the Obi. Long. 81. 50. E. Lat. 54. 48. N.

KOMORN, a circle of the province of the Farther Danube, in the Austrian kingdom of Hungary. It extends over 1167 square miles, comprehending one city, five market-towns, and 156 villages and hamlets, with 12,256 houses. The inhabitants are two-thirds Catholics, and one-third reformed Protestants. The capital is a city of the same name, at the junction of the Waag with the Danube. It is strongly fortified, and has five Catholic, one Lutheran, one Reformed, and one Greek church, with 1400 houses, and 11,200 inhabitants. A great part of the city was thrown down by an earthquake in 1763, and again by another in 1783, but the damages were speedily

[1] *Narrative of a Journey into Khorassan*, Appendix, p. 108.

repaired. There are manufactures of woollen cloth, several tanneries, and the fishery on the Danube gives employment to many persons. There is a strong fort on the point of land where the two rivers meet. Long. 18. 2. 30. E. Lat. 47. 45. 34. N.

KONG, a kingdom of Central Africa, to the south of the Niger, nearly midway between Ashantee and Bambarra. According to Park, *kong* signifies mountain; and the physical aspect of the country corresponds to this, being traversed by a great central chain of mountains bearing the same name. There is little known concerning this kingdom; and it appears to be by no means so wealthy and powerful as that of Ashantee, although the country is populous, and abounds in horses and elephants.

KONG-CHANG-FOU, a city of China, of the first rank, in the province of Shensi, near the western frontier. The surrounding country is mountainous, and abounds with the animal which produces musk. It is situated near the head of the river Hoeiho, which falls into Yellow River, and is the seat of an extensive trade. Long. 104. 19. E. Lat. 34. 56. N.

KONGSBURG, a city of Norway, in the province of Aggerhuus. It is situated on the Lovenelf, in a deep and wild valley, which the mountain Jons Knuber, 2800 feet high, overlooks. It contains 1500 houses, and 6800 inhabitants. It was formerly the head of a mining department, and near it the silver mines were extensively worked for several ages, till, in the present century, it was found that the expense exceeded the value of the gross proceeds, and the works were abandoned. The establishment of the cotton manufacture now gives employment to the population, who would be otherwise in a most destitute condition.

KONIG, George Matthias, a learned German, born at Altorf, in Franconia, in 1616. He became professor of poetry and of the Greek tongue there, and librarian to the university; in which last office he succeeded his father. He gave several public specimens of his learning, but is principally known for a biographical dictionary, entitled *Bibliotheca Vetus et Nova*, 4to, Altorf, 1674; which, though it is very defective, is still useful to biographers. He died in 1699.

KONIGBERG, a city of the circle of Barsch or Bars, in the Austrian kingdom of Hungary, on the river Gran. It is in a deep valley, surrounded by three mountains. It contains 510 houses, and 3770 inhabitants. There were formerly mines of gold and silver, but these have ceased for several years to be worked. Long. 18. 32. 35. E. Lat. 42. 25. 42. N.

KONIGINGRATZ, a circle of the Austrian kingdom of Bohemia, extending over 1536 square miles. It contains forty-two cities and towns, and 810 villages and hamlets, with 48,259 houses, and 271,080 inhabitants. It is moderately fertile, and produces corn, flax, wood, and has good pasturage. The capital is a city of the same name, on the river Elbe, well fortified. It contains, besides the cathedral, six churches, two hospitals, and an orphan-house, with 624 dwellings, and 5903 inhabitants, employed chiefly in making woollen cloths. Lat. 50. 12. 38. N.

KONIGSBERG, a city of Prussia, on the river Rorikê, in the circle of that name, and in the Frankfort division of the province of Brandenburg. It is walled, and contains 458 houses, with 4178 inhabitants, employed in making cloth and hosiery, and in distilleries and breweries.

Königsberg. In the recent division that has been made of those parts of the dominion of Prussia that are out of Germany, East Prussia has been formed into two governments, viz. Königsberg and Gumbinnen. The former of these is composed of the territory formerly called East Prussia, and a small part of Lithuania. It is bounded on the north by Russia, on the east by the province of Gumbinnen, on the south by Poland, and on the west by the Baltic Sea and the province of Dantzic. Its extent is 8910 square miles. It contains forty-eight cities or places formerly walled, thirteen market-towns, 3717 villages, and 76,949 houses. The inhabitants in 1826 were 683,925, of whom about 450,000 were Protestants, 110 Catholics, and the rest consisted of Jews, Moravians, and Menonites. It is generally a level country, presenting few elevations, and these scarcely higher than 200 feet above the level of the sea. It is a district in which are to be seen numerous lakes, some of great extent. The largest of these, the Kurische-Haff, extends over 620 square miles; and the next in size, the Frische-Haff, is upwards of 500 miles. Besides these, there are others of various extent, amounting in number to near five hundred. The soil is generally sandy, but moderately productive, and yields good crops of rye and barley, and a small proportion of wheat. Its breeds of sheep and cows have nothing remarkable, either for their number or their qualities; but this province has been the repository from which the best and most numerous horses have been reared of the whole monarchy.

The country is tolerably fertile; and from some of the districts of Polish Russia much corn is brought down by the navigable rivers. The export of corn is, therefore, one of the chief branches of commerce, and has been as follows:—

An Account showing the Corn exported from Kōnigsberg in each Year from 1818 *to* 1831.

Years.	Wheat. Quarters.	Rye. Quarters.	Barley. Quarters.	Oats. Quarters.	Pease. Quarters.	Beans. Quarters.	Tares. Quarters.	Hemp and Flax Seed. Quarters.
1818	31,290	84,290	44,250	38,590	29,530	...	...	...
1819	12,320	73,600	29,520	15,130	19,910	1,360	...	18,230
1820	28,610	67,690	8,180	55,650	12,100	410	4,390	24,970
1821	15,590	14,590	2,150	8,640	2,334	...	4,880	18,640
1822	5,910	1,010	2,920	2,000	2,080	...	780	31,730
1823	4,280	10,300	240	1,160	2,150	...	...	3,200
1824	10,020	3,930	2,980	15,660	4,120	...	220	12,570
1825	8,160	6,570	15,310	5,930	7,120	...	9,260	10,160
1826	14,830	6,920	2,010	53,210	8,030	...	7,160	22,710
1827	37,540	72,280	23,320	81,800	5,030	980	9,290	27,280
1828	95,430	129,200	13,460	13,680	9,190	560	5,160	28,840
1829	76,980	81,540	22,720	36,600	4,220	1,070	2,070	37,180
1830	75,050	250,120	16,870	83,100	23,600	1,300	1,410	38,730
1831	75,650	160,900	9,880	40,920	15,060	990	3,260	18,840

The other exports in one year (1831) were as follow :— Bristles, 167,997 pounds; feathers, 13,860 pounds; flax, 75,230 stones; hemp, 60,276 stones; hides and skins, 53,707 pounds; wax, 31,955 pounds; wool, 118,068 pounds; linen yarn, 9000 bundles. The remaining exportable commodities are chiefly the produce of the extensive forests, consisting of ship-timber, pot-ash, and tar. These are chiefly shipped at Memel, but some at the capital. Some portions of flax and of flax-seed are also exported. The manufactures of the province are merely of a domestic nature, and very inconsiderable.

Konigsberg, the capital of the province, is a city standing on the navigable river Pregel, which empties itself into the Frische-Haff, about five miles below it. With the exception of Berlin, it is the largest city in the Prussian dominions, and was formerly the capital. It is surrounded with walls defended by thirty-two ravelins, contains a royal palace, eleven Lutheran, two Reformed, one Catholic, and one Menonite church, amongst which the domkirch or cathedral is remarkable as containing the remains of the most distinguished individuals. It has several establishments for benevolent purposes, especially the great royal hospital, with nearly 1000 patients. The houses are 4503, and the inhabitants, including troops, 63,240, of whom more than 1500 are Jews. Königsberg is the seat of an ancient and celebrated university, containing twenty-two professors, having a botanic garden, an astronomical observatory, and the other establishments for the education of students in medicine, law, theology, and philosophy. It has, besides, institutions for the earlier stages of education. The trade is considerable, notwithstanding the shallowness of the river renders it necessary to load and unload ships by the aid of lighters. The manufactures are only for the consumption of the province. Long. 20. 25. 1. E. Lat. 54. 42. 12. N.

KONIGSLUTTER, a city of the duchy of Brunswick, in Germany, the capital of a circle of the same name. It is on the river Lutter, is walled, and contains a palace of the prince, two churches, in one of which the minster is an ancient monument to the memory of the Emperor Lothario the Second and his empress. It contains 338 houses, and 2850 inhabitants, who carry on several extensive distilleries, and make linen and other cloths.

KONIGSTEIN, a small city of the kingdom of Saxony, in the bailiwick of Pirna and province of Meissen, situated on the left bank of the Elbe, and containing 190 houses, with 1450 inhabitants. It is in that part of the kingdom commonly called Saxon Switzerland, and is remarkable for the impregnable fortress adjoining to it. The mountain castle overlooks the town, on a rock whose perpendicular face towards the Elbe is about 900 feet. It includes, on the top of the rock, within its walls, fields, gardens, meadows, and a wood, and a well abounding with water, 900 feet deep, so that sufficient provision for the garrison can be grown within itself; but there are large storehouses on the rock, for provisions, ammunition, and all necessaries; amongst others, two great casks of wine, capable of containing 1000 hogsheads. The casernes are bomb-proof, and, from the nature of the rock, the castle can neither be assailed by traverses nor by mines. In this fortress, the jewels, money, curiosities, and archives of the crown have been deposited in time of war, and were secure when the capital and its palaces were occupied by Frederick of Prussia, as well as at a more recent period, when Dresden was the head-quarters of the French army, and assailed by the allied forces of Russia, Austria, Prussia, and Sweden. The castle contains also the state-prison. On the opposite side of the Elbe is the fortress of Lillienstein, on a sandy rock 1080 feet above the river. It is now dilapidated, but was occupied by the French in 1813, who added to the works.

KONJEUR, a small district of Hindostan, in the province of Orissa, situated principally between the twenty-first and twenty-second degrees of north latitude. It is bounded on the north by the districts of Singboom and Mohurbunge, and to the south by the province of Cuttack. It was formerly tributary to the Mahrattas, but is now occupied by independent chiefs. It is fertilized by many streams, but is now in a neglected state. The principal towns are Konjeur, Ogurapoor, and Andapoorgur.

KONKODOO, one of the three independent states into which Bambouk, a considerable territory of Western Africa, is divided. Latadoo and Bambouk are the names of the two other kingdoms, the latter having given its name to the whole territory. The country is crowded with steep mountains, composed of a species of red granite, but they are clothed with vegetation to the very summits; and the villages, which are built in delightful glens, present a most romantic appearance. Gold is distributed in larger or smaller quantities throughout Konkodoo, and the chief occupation of the inhabitants seems to be the collecting of the precious metal, which they separate from grosser matter by mechanical processes. This kingdom is governed by a chief; but the Siratik, the regal title of the sovereign of Bambouk, enjoys an honorary superiority.

KOOKIES, a singular race of people, who inhabit the mountains to the north-east of the Chittagong district, in the province of Bengal. They are little known to the inhabitants of the plain, and are seldom seen except when they visit the markets on the borders of the jungles in the Rungancah and Aurungabad divisions, to purchase salt, dried fish, and tobacco. The Kookies are a stout, muscular race, but not tall, and have the peculiar Tartar features of the Asiatics in the east, namely, the flat nose, small eye, and broad, round face. They are divided into a number of distinct communities independent of each other, and are all hunters and warriors. Their arms are bows and arrows, clubs and spears; and, by way of defence, they build their villages, which generally contain from 500 to 2000 inhabitants, on the most inaccessible hills. They are much addicted to war, in which they are almost constantly engaged; and, like most savages, they prefer ambuscades and surprises to regular battle. They are vindictive in their dispositions, and always shed blood on a principle of retaliation. They use an intoxicating liquor distilled from rice, which they drink at marriages, these being attended with much feasting. They have an idea of rewards and punishments in a future state, and they have also a saint or angel which they worship as the mediator between them and the Deity. They have no regular priests, and the master of each family instructs the children in the religious knowledge which he thinks necessary. They sometimes engage in war with the Choomeas; but being in great dread of fire-arms, they are quickly driven back to their native mountains. They are, however, a great terror to the inhabitants on the borders of the Chittagong district, especially to the wood-cutters, on whom they frequently make inroads. They subsist partly by the chase; and they have no religious prejudice against any animal. An elephant is considered as a great prize by them, as it affords so great a quantity of food. Their domestic animals are gagals, goats, hogs, dogs, and fowls.

KOOM, a city of Persia, in the province of Koom. It stands on an extensive plain, and on the banks of a small river, which rises at no great distance, and is lost in the great Salt Desert. This city was built by the Saracens in the year 806, upon the site, as D'Anville supposes, of the ancient Choana. It was erected from the ruins of seven towns, which had composed a small sovereignty under an Arabian prince. It afterwards became one of the finest cities of Persia, and was long celebrated for the manufacture of silks. It was taken by the Afghans in 1722, when they invaded Persia, and completely destroyed it. Part of it has since been rebuilt, but it has still the appearance of a vast ruin. There is a very beautiful college, with a celebrated mosque and sanctuary erected to the memory of Fatima, the daughter of Imaun Reza. In the mosque are still to be seen the tombs of Sofi the First and Shah Abbas the Second. The dome is lofty, and has been gilded at the expense of the king. About ten miles to the north of the town is a very curious hill in the middle of the plain, called by some Nimick Koh, or the mountain of salt, and by others Koh Talism, the mountain of the talisman; for, according to the tradition of the country, no person ever succeeded in gaining its summit. Long. 50. 29. E. Lat. 34. 45. N.

KOONTASSEE, a small town of Hindustan, in the province of Gujerat and district of Morvee, near the great marshes called the Runn. The country in the neighbourhood is in a deplorable state, and the villages nearly uninhabited, owing to the tumult and confusion which pervade the whole district.

KOORBAH, a town of Hindustan, province of Gundwana, district of Choteesgur, thirty-six miles north-east from Ruttunpoor. Long. 83. 8. E. Lat. 22. 25. N.

KOOTAHE, or COCOA ISLAND, in the South Pacific Ocean, and separated from Neootabootaboo by a channel only three miles broad. It was discovered by Schouten and Le Maire, on the 10th May 1616. Long. 173. 48. W. Lat. 15. 55. S.

KOPAUL, a town of Hindustan, belonging to the nizam, in the province of Bejapoor, and district of Gujundergur. It is one of the strongest places in the south of India. The lower fort is a semicircle at the bottom of a steep, rocky mountain, commanded by a middle and upper fort, the last overlooking the whole. It is chiefly formed of one immense rock, almost perpendicular, and of great height. In 1790, when it was possessed by Tippoo, it was besieged by the nizam's army, and capitulated after a siege of six months. It is 63 miles north-west from Bellary. Long. 76. 6. E. Lat. 15. 28. N.

KOORANKOO, a considerable kingdom of Western Africa. It is bounded on the west by the Bullom, Limba, and Timmanee countries; on the north by Limba, Tamisso, and Soolimana; on the east by Kissi, the Niger, and countries little known; and on the south by those countries which border on the coast. These limits include a very extensive tract of country, but the boundary lines are somewhat indefinite; indeed they are continually fluctuating, according to the fortunes of war as it is practised amongst savage tribes of men. For our knowledge of Koorankoo we are indebted to the enterprise of Major Laing, by whom is was visited and has been described. A chain of hills, sixty miles in length, runs in a north-easterly direction throughout the whole of the country. These are for the most part clothed at their base with the camwood tree, which constitutes the staple article of trade. The range is composed of micaceous granite and mica slate, interspersed with veins of quartz and laterite, so strongly impregnated with iron as sensibly to affect the needle at some inches distance. The principal rivers appear to be the Rokelle and the Kamaranka. The source of the former is set down in Major Laing's map as in latitude 9. 45. north, longitude 9. 55. west, a parallel which lies in the Soolima country. It issues from the foot of a hill, by barometrical measurement 1470 feet above the level of the Atlantic; and after receiving several tributaries, and traversing Koorankoo and other countries, falls into the sea at Sierra Leone, to which colony it is of great importance. The Rokelle is the only river, says Major Laing, which bears one name from the source to the sea. The rivulets and longer streams which discharge themselves into it are picturesquely beautiful, dashing over rugged granite rocks several hundred feet in elevation. One of the tributaries, called Ba-Jafana, had a bed of about fifteen yards in breadth, though only about three miles from its source, which is in a mountain named Balakonko, where the natives procure the camwood in great abundance. The banks of the river are likewise lined with this wood, which grows to the height of about sixty feet. The Tongolelle, a rapid stream about thirty yards broad, also joins the Rokelle. It takes its rise in a sort of basin, surrounded with thick brushwood, and gives birth to a rich and luxuriant growth of wild canes in its centre, affording a cool retreat to the leopards which infest this part of the country. To such an extent are these rapacious animals dreaded, that Major Laing "observed the sites of several towns now in ruin, the inhabitants of which had been forced to move to the westward to avoid their attacks." The Kamaranka appears to be a river of the same size and general character as the Rokelle. It has also numerous tributaries. All the rivulets running south through the mountain chain already mentioned collect behind a lofty hill called Botato, and fall into it. About a mile from Nyiniah, one of the largest and best-built towns in Koorankoo, is the source of a fine stream, which joins the Kamaranka. The spring forms a basin ten yards in diameter, embanked with masses of granite, and overhung with lofty trees, clad with a foliage so thick as to bid defiance to the rays even of a vertical sun. Major Laing describes the scenery in this quarter as occasionally very picturesque and beautiful. After crossing a range of hills to the eastward of Nyiniah, there presented itself to the eye of the traveller "an extensive valley, partly cultivated, and partly covered with long natural grass about five feet high, the cultivated part newly sown; lines of stately palm trees, as regular as if laid out by art, with here and there a cluster of camwood trees, their deep shade affording a relief to the lighter hue of the smaller herbage; these, with a murmuring rivulet meandering through the centre, exhibited the appearance of a well-cultivated and tastily-arranged garden, rather than a tract amid the wilds of Africa; whilst, in the distance, mountain towered above mountain in all the grandeur and magnificence of nature. There was also seen an extensive plain covered with short, thin grass; and our traveller having crossed a mountain ridge which separates the head streams of the Kamaranka, flowing southward, from those which reach the Rokelle, he ascended a lofty eminence called *Sa Wolle.* The summit of this mountain, according to barometrical measurement, was 1900 feet above the level of the sea, and the view from it was grand and extensive in the highest degree. A capacious circle of nearly two degrees in diameter, interrupted only by a hill to the eastward, which rose considerably higher, presented a landscape of the most rich and varied scenery.

Camwood is the staple article of trade, and it is sent down the Rokelle and the Kamaranka to be bartered for various articles, chiefly salt. There is also a considerable advantage derived from the extensive manufacture of cloth. The loom in which this is wove is very narrow. The artisan sits under an open shed, from the roof of which are suspended two frames of equal breadth with the roof, nicely divided with perpendicular strings. By a motion of the feet, these are made to cross one another alternately, and at each motion the shuttle is cast through. In this manner of working they exhibit much dexterity, and make good progress. Women are employed in spinning thread, but the sowing and weaving are performed by men.

Major Laing observes, "Koorankoo is the first country to the eastward of Sierra Leone where the manufacture of cloth is common; but it is generally of a coarse quality. As the traveller advances eastward, he finds the natives improve both in the texture of the cloth and the size of the loom. In Sangara, very large and handsome cloths are manufactured." The Koorankoos also cultivate a considerable portion of their ground; and in general intelligence and industry they rank above the neighbouring tribes. Each house has its enclosed garden, where are raised cassada, in the cultivation of which they bestow great care; spinach, small onions, and tankana, an herb which, when dried and beaten, answers as a cheap substitute for snuff. In religion they are for the most part pagans, and they exercise unlimited faith in *greegrees* (a sort of protecting spirits), for whom they have houses consecrated at the entrances of the towns. The head men are clothed in a long gown, trousers, cap, and sandals, but the women are contented with more scanty habiliments. They are great adepts in the art of dressing hair, and ornament each other's heads with great skill. Dancing is a favourite amusement; and on the night of a funeral, which always takes place the day after the demise of the individual, they exhibit their skill in this art, brandishing hatchets or spears in both hands. The laws of this people are few and inartificial. Murder is the only crime punishable with death, and even this can be compensated by property.

There is a portion of the Kooranko country inhabited by the tribe called the Soolimas. They have a territory of their own, which Major Laing describes as picturesque in the extreme, being diversified with hills, extensive vales, and fertile meadows, belted with stripes of wood, and decorated with clumps of trees of the densest foliage. The soil is remarkably fertile, producing chiefly rice, yams, which are planted like potatoes in England, and ground nuts, which are cultivated like our field peas. Bananas, pines, and oranges, are the principal fruits; but the first only are found in any degree of perfection. The Soolimas have numerous herds and flocks, and a diminutive kind of poultry. The elephant, the buffalo, a species of antelope, monkeys, leopards, and wolves, are the wild animals. The principal towns of the Soolimas are all situated in the Koorankoo country. These are Falaba, the capital; Sangonia, a very large town on the borders of Footah Jallou, surrounded with a strong and lofty wall; Semba, a large, populous, and rich town near the southern frontier, situated on a very lofty eminence; Mousaiah and Koonko-doogore, a stage from Semba, in the hills. In all, these places contain a population of about 25,000 souls. Falaba derives its name from the river Fala, on which it stands. It is nearly a mile and a half in length, by a mile in breadth, and closely built compared with the generality of African towns. It was built in 1768 by the Soolima king, as a stronghold to protect him against his enemies the Foolahs; and the site is well chosen as a place of defence, being on a gently-rising eminence in the centre of a large plain. The town is surrounded by a strong stockade of hard wood, and a deep and broad ditch, which renders it quite impregnable according to the military tactics of the Africans. It contains about four thousand circular clay huts, having pyramidal roofs of thatch; and, being neat and clean, they present a very respectable appearance. The palaver or court-house stands in an open space, towards the southern extremity of the town, and is a place of recreation as well as of business. In the centre of the town a large piece of ground is left vacant, for the purposes of exercise, of receiving strangers, and of holding palavers. Formerly the Soolimas chiefly occupied themselves in war, but this is less practised amongst them now than heretofore. In person they are short and muscular, and well adapted to endure privation and fatigue. Their military weapons are the spear, the musket, the sling, and the bow: in the management and use of the two latter they are most expert. Where their predatory habits do not interfere, they seemed to Major Laing both mild and inoffensive in disposition. In their domestic occupations the men and women appear to have changed places. The men attend to the dairy; they also sow and reap; but all the other cares of husbandry devolve upon the female sex. They are masons, plasterers, surgeons, and the like; whilst the men employ themselves in sewing, and not unfrequently in washing clothes. In religion, government, dress, customs, and the like, the Soolimas resemble the Koorankoos, so that these do not require a separate description.

KOPYS, a town of the province Mohilew, in Russia, the capital of a circle of the same name, on the river Dnieper. It contains a Greek, Catholic, a Lutheran, and a Unitarian church, with 3800 inhabitants. Long. 30. 10. E. Lat. 54. 20. N.

KORAH, a district of Hindustan, in the province of Allahabad, situated in the doab, or the space enclosed between the Ganges and the Jumna, and between the 26th and 27th degrees of north latitude. The country is in general flat, except on the banks of the Ganges, where the villages are situated, being usually surrounded by mango trees. The whole territory is fertile, and in a progressive state of prosperity, under the administration of the British, to whom it was ceded in 1801. Korah is the name of the principal town, in the province of Allahabad. The travelling distance is sixty-seven miles from Lucknow, and 301 from Delhi. Long. 80. 40. E. Lat. 26. 6. N. This is also the name of a village in Cutch, situated about ten miles south from Luckput Bunder, on the road from that place to Mandavee, a sea-port on the Gulf of Cutch. Lat. 23. 38. N.

KORDOFAN, a country of Central Africa, situated between the kingdoms of Darfoor and Sennaar. Little can be said of it, except that from time immemorial an inveterate animosity has subsisted between the Foorians and Kordofanese, arising principally from mercantile jealousy, as the country of the latter lies in the route to Sennaar and Suakem, the most direct line of communication with Mecca. The governors of Kordofan had for a long time been deputed by the Mek of Sennaar; but, in consequence of the weakness and dissensions of the latter kingdom, the power was usurped by the Foorian sultan. But the enterprising ruler of Egypt having reduced all the provinces of Africa as far as Sennaar, both Kordofan and Darfoor were enumerated among the kingdoms which now acknowledge by a tribute the conqueror of Egypt and Arabia. The country is of an arid character, destitute of any thing like a river or lake. The tropical rains, however, which fall at a certain season with great violence, inundate a considerable portion of the country, and thus, affording moisture to vegetation, agricultural operations are carried on. These are sufficient to produce wheat, and *doku*, a species of millet. The king enjoys absolute authority, but policy compels him to court his warriors, who, like those of Bornou, are invested in chain armour. What the number of inhabitants occupying this rude tract of country may be, it is impossible to say.

KORDOS, the ancient Corinth, a town in European Turkey, in the peninsula of the Morea, near the Gulf of Lepanto. It is the seat of a great archbishop, and contained about 500 houses, with 4000 inhabitants. Long. 23. 3. 10. E. Lat. 37. 55. 54. N.

KORNA, a flourishing little village of Irak Arabi. It is situated at the confluence of the Euphrates and the Tigris, and carries on some trade with Bassora. It was recommended by Sir J. Malcolm as a fort which might

Korotscha || Kosciuszko.

be occupied and fortified, and from which the predatory Arabs might be kept in check.

KOROTSCHA, a city of European Russia, in the province of Kursk, the capital of a circle, and standing on a river of the same name. It contains six churches, 1033 houses, and 9800 inhabitants. Long. 36. 57. E. Lat. 50. 45. N.

KOSCIUSZKO, Thaddeus, a Polish general, less celebrated for his exploits than for his attachment to the independence of his country, was descended of a noble but not opulent family, in the province of Lithuania. He was educated in the school of cadets at Warsaw, and made such progress in drawing and in mathematics, that he was named one of four pupils destined to travel at the expense of the state, in order to improve their talents by observation and inquiry. He consequently repaired to France, and having there passed several years devoted to study, returned to his native country enriched with new acquisitions. He obtained the command of a company, and proposed to prosecute the military profession in the Polish army, when the consequences of an unfortunate attachment for the daughter of the Marshal of Lithuania blighted his prospects, and forced him to leave his country. He proceeded to North America, which had just declared itself independent; served as adjutant to General Washington in the war which the revolted colonies had to maintain against the mother country, was decorated with the order of Cincinnatus, and returned to his own country, where he lived in retirement until 1789. About this period he was promoted to the rank of general-major by the Diet, which was then making vain efforts to restrain the influence of foreign powers. Kosciuszko was at that time little known; but in 1792 the affair of Dubienka, where with four thousand men he defended for six hours a post attacked by fifteen thousand Russians, gained him much reputation. He served, with equal distinction, during the whole campaign of that year, under the young Poniatowski; but the weakness of Stanislaus rendered fruitless the most generous efforts to maintain the independence of his country. He submitted to the conditions which were imposed upon him by Russia, and, under the appearance of a treaty of peace, signed the ruin of Poland. The bravest officers of the Polish army, unable to support the disgrace thus incurred, gave in their resignation. Kosciuszko was amongst the number; but having become an object of extreme suspicion to the enemies of his country, he found himself obliged to quit Poland; a circumstance which added much to his credit with the patriotic party, and caused him to be declared a French citizen by the Legislative Assembly of France. He afterwards retired to Leipzig, where his friends in Warsaw, having decided to make a new effort against the Russians, apprised him that he had been chosen as their chief. Kosciuszko did not refuse the perilous honour thus conferred on him; but, convinced that the means which his party had at their disposal were still insufficient, he resolved to proceed circumspectly, and, in order to avoid suspicion, undertook a journey to Italy, where he passed several months. At the beginning of 1794, however, having learned that it was no longer possible to restrain the impatience of the Poles, he drew near to the scene of approaching action, and reached Cracow at the moment when Medalinski had raised the standard of insurrection, and when he himself had just been declared generalissimo of the national forces. Finding himself thus invested with dictatorial power, in circumstances of great difficulty, he was careful not to abuse the trust reposed in him; and, by his conduct in every instance, he amply justified the choice of his countrymen. Master of Cracow, he published a manifesto, and immediately marched against the Russians at the head of a corps of five thousand men. He encountered the enemy, in number about ten thousand, at Wralawice, and, after a combat of four hours, completely defeated them. This first success produced a general rising; Warsaw was delivered from the presence of the Russians; and Kosciuszko soon saw himself at the head of an army of fifty thousand combatants, including about twenty-five thousand regular troops. With this comparatively small force the Polish general-in-chief had to make head at once against the Russians and the Prussians. Frederick William II., who had just failed in his contest with the French, appeared desirous to avenge himself for this affront on the Poles; and, at the beginning of 1794, he marched against Warsaw, at the head of forty thousand men. Kosciuszko, who, upon this point, could not oppose to him more than fifteen thousand men, had, nevertheless, the courage to attack him at Szezekocin, on the 8th of June 1794; but, after a murderous combat, in which he had two horses killed under him, he was obliged to retire to the entrenched camp that covered the capital, where, for two months, he resisted the most impetuous attacks and reiterated assaults. At the same time, he contrived to restrain and keep in order a furious populace, prone to give way to the greatest excesses. Scarcely had he been delivered from the Prussians, in consequence of the diversion which the insurrection of Great Poland operated in his favour, when Kosciuszko saw advancing against him the Russian army under Suwarow, and also that commanded by Fersen. It was in vain that he attempted to prevent the junction of these two armies. On the 4th of October, being attacked at Macijowice, by very superior forces, he obstinately disputed the victory during the whole day; but at length he sank down pierced with wounds, exclaiming, as he fell, *Finis Poloniæ*. He was about to expire under the sabres of the Cossacks, when being happily recognised, he was immediately surrounded with the respectful attentions of his enemies. Having been sent as a prisoner to St Petersburg, he remained two years confined in a dungeon, whence he was not liberated until after the death of the Empress Catharine. Paul I. immediately after his accession set him at liberty, and loaded him with marks of esteem and regard. The first use which Koscinszko made of his liberty was to proceed to England, and thence to America, where he passed several years amongst his old companions in arms. In 1798 he returned to France, where he was received with much distinction, and learned that a great number of his countrymen had enlisted under the banners of the new republic. Those who served in the army of Italy sent him the sabre of John Sobieski, which had been found in the Casa di Loretto. From this time he lived either at Paris or at a country-house which he had purchased near Fontainebleau. When Napoleon was about to invade Poland in 1807, he wished to avail himself of the name of Kosciuszko, in the hope of thereby inducing the people of that country to revolt against the Russians. But the Polish general had too much knowledge and experience not to divine the object for which recourse had been had to him, and he answered by positively refusing to comply with the imperial invitation. Nevertheless there was published in the journals a proclamation fabricated in his name, and addressed to the Poles. But although it was not till 1814 that he had an opportunity of denouncing this fraud, yet the truth had long been known in Europe, and the hero of Poland had never ceased to be an object of veneration, even when the government of Bonaparte treated him as a suspected person. When the Russians penetrated into Champagne in 1814, they learned with surprise that their ancient enemy was living peaceably in the immediate vicinity. All those who had an opportunity of visiting his retreat testified their regard for him in the strongest manner; and the Emperor Alexander himself had a long interview with the veteran and patriotic soldier. Nothing could induce Kosciuszko to return to his native country. In 1815 he made a tour in Italy, and afterwards established himself at Saleure in Switzerland, where he died on the 16th of October 1817. On the intelligence of his demise, the whole of Europe resounded with his eulogium; amongst all nations, and in every country, justice was equally rendered to the brave soldier and the true patriot, who, without any other object than the independence and welfare of his country, had exposed himself to the greatest perils, and the most painful sacrifices. His mortal remains were interred in the cathedral at Cracow, between those of John Sobieski and of Joseph Poniatowski. See Poland. (A.)

KOSELSK, a city of the province of Kaluga, in Russia, the capital of a circle of the same name. It stands at the junction of the river Schisbra with the Dragunka, and is the best built city of the province. It contains broad streets, a spacious market-place, seven churches, four of them of stone, and 559 houses, with 3800 inhabitants, who have considerable trade by the two rivers. Long. 35. 25. E. Lat 54. 12. N.

KOSFELD, a city, the capital of a circle of the Munster division of the province of Westphalia, in Prussia. It stands on the river Berkel, has a fortress adjoining, and contains two churches, 490 houses, and, including the garrison, 5850 inhabitants. There are linen and woollen manufactures. Long. 7. 7. 17. E. Lat. 51. 57. 10. N.

KOSLIN, a circle of the Prussian government of Pomerania, which extends over 5687 square miles, comprehending twenty-eight cities and towns, and 1196 villages and hamlets, containing, in 1827, 303,836 inhabitants. It stretches along the shore of the Baltic Sea. The chief place is the city of the same name, which contains the several boards of administration for the province, and 556 houses, with 6440 inhabitants. Long. 16. 15. 55. E. Lat. 54. 12. 7. N.

KOSLOW, a city of the Russian province Tambow, the capital of a circle of the same name, on the river Woronesh. It contains three wooden and five stone churches, a convent, and 1237 houses, with 8060 inhabitants, who trade in salted fish, hides, tallow, and other produce of the soil. Long. 40. 12. E. Lat. 54. 13. N.

Koslow, a city of the Russian province of Taurien, the capital of a circle of the same name. It stands at the bottom of a deep bay on the Black Sea. It has been declared a free port ever since 1798, and has a quarantine station. Large quantities of produce are shipped from it, consisting of wheat, salt, iron, wool, linen, leather, horses' tails and hair, hides, and tallow. It contains 928 houses, and, according to Pallas, 11,500 inhabitants. It is considered to be unhealthy, and the water is not very good. Long. 33. 20. E. Lat. 45. 15. N.

KOSTENDIL, a city of Turkey in Europe, the capital of a circle of the same name, in the province of Rumili. It is an open town, on the river Egrifu, at the foot of the mountain of that name. It contains many warm baths, and has a population of 8000 persons.

KOSTROMA, a province of European Russia, to the eastward of Jaraslow, extending over 39,710 square miles. It comprehends seventeen cities or towns, and 851 parishes, whose population amounts to 1,422,000 souls. The nobility are numerous, and hold two thirds of the land, and of the peasants who work upon it. It is a level district, with a few elevations near the banks of the rivers; and it is in many parts covered with forests, which yield excellent timber. The Wolga is the chief river, and is navigable, as are the Kostroma and the Unscha. The soil is by no means fertile, but it produces sufficient corn for the inhabitants, and is enabled to grow good flax and hemp. The pastures maintain cattle, which furnish hides and tallow. The rivers abound with salmon, sturgeon, and other fish. The females spin yarn in most of the cottages, and it is woven and bleached within the province. The several branches of industry enable an exportable surplus of hemp, flax, tallow, hides, dressed leather, fish, mats, bark, tar, soap, and some iron. The navigation of the Wolga is a source of commerce. The city of Kostroma, the capital of the province, and of the circle of its own name, is at the junction of the Kostroma with the Wolga. It is the seat of an archbishop, and of the boards of revenue and law; is surrounded with walls, lately converted into promenades; and contains fifty churches, including the cathedral, an ecclesiastical seminary, a gymnasium, several hospitals, and 1057 houses, with 8200 inhabitants. The leather made here is celebrated throughout Europe, and occupies eighteen considerable tanneries in preparing it. There is also a trade in sailcloth and other linen. Long. 41. 7. 31. E. Lat. 57. 45. 40. N.

KOSZOG, a city of the circle of Eisenburg, in the province of Farther Danube, in the kingdom of Hungary. It is sometimes called Guns, from the river of that name, on which it is built. It has some trade in internal productions, and contains 576 houses, with 5310 inhabitants, mostly of German origin. Long. 16. 27. 58. E. Lat. 47. 22. 54. N.

KOTBUS, a city, the capital of the circle of the same name, in the Prussian province of Brandenburg, on the river Spree. It is a considerable manufacturing place, with 739 houses, and 6430 inhabitants. It has a good internal trade by the navigable river.

KOTHEN, a city, the capital of the duchy of Anhalt-Kothen, in Germany. It is the residence of the sovereign, and the seat of the civil and ecclesiastical branches of the administration. It is on the river Ziathe, which runs to the Elbe, on a level and fertile plain. The palace is remarkable for its hall, decorated with the arms and the proverbs of Prince Ludwing, built in 1617. It contains 740 well-built houses, and 5500 inhabitants. It has three churches and several public buildings, and the institutions adapted to a contracted independent state. The trade is mostly dependent on the wants of the court.

KOTTERUS, Christopher, was one of the three fanatics whose visions were published at Amsterdam in 1657, with the title of *Lux in tenebris.* He lived at Sprotta, in Silesia, and his visions began in 1616. He fancied he saw an angel under the form of a man, who commanded him to go and declare to the magistrates, that, unless the people repented, the wrath of God would make dreadful havock. The elector palatine, whom the Protestants had declared king of Bohemia, was introduced in these visions. Kotterus waited on him at Breslau in December 1620, and informed him of his commission. He went to several other places, and at last to the court of Brandenburg. As most of these predictions promised felicity to the elector palatine, and unhappiness to his imperial majesty, the emperor's fiscal in Silesia and Lusatia got him seized, set on the pillory, and banished the emperor's dominions. Upon this he went to Lusatia, and there lived unmolested till his death, which happened in 1647.

KOTOO, one of the small Friendly Islands, scarcely accessible, owing to the coral reefs that surround it. It is sixteen miles north of Annamooka. Long. 185. 11. E. Lat. 19. 58. S.

KOTTIAR, a district of Ceylon, situated on the eastern side of the island, between the eighth and ninth degrees of north latitude. Cinnamon, betel-nuts, cocoa-nuts, and timber, form its chief produce.

KOTTILGHUR, a fortress of Hindustan, in the province of the Northern Circars, situated on the summit of a very high and inaccessible hill. It consists of a fort and citadel, which is capable of making very great resistance; though it was taken by the British in 1817, with little resistance.

Kotzebue.

KOTZEBUE, AUGUSTUS FREDERICK FERDINAND VON, a prolific German dramatist and miscellaneous writer, was born on the 3d of May 1761, at Weimar, where his father was a counsellor of legation. He early evinced a propensity to poetry, and, whilst yet a boy, the representation of a play which he witnessed inspired in him such a love of the drama as determined his future destiny. He received the rudiments of his education at his native place, and when he was about sixteen years of age he entered the university of Jena. Here he remained one year; but certain family circumstances occurred which induced him to remove to Duisburg, where he studied for a short time at the university, and returned to Jena in 1779. He was destined for the profession of the law, but the master passion predominated; and in gratifying his love of the drama, as well as literature in general, he consumed no inconsiderable portion of his time. If at this period he did not display great talent, he at least evinced wonderful versatility. Tragedy, comedy, ballads, essays, and other species of literary composition, came rapidly from his prolific pen. Their merits, however, he himself confesses in his autobiography, were exceedingly equivocal, although some of his plays were acted with applause. In his nineteenth year, he closed his studies at Jena with taking the character of an opponent at a doctor's degree. Soon afterwards he returned to his native place, where he diligently applied himself to the pandects, and was admitted as an advocate. But his addresses to the muses were still as assiduously paid as ever; and, in the ardour of his desire for distinction, he tried his skill in almost every species of composition, imitating, as caprice or admiration predominated, all the great writers of Germany, Schiller, Göethe, Wieland, Hermes, and others.

In 1781, on the invitation, it is said, of the Prussian ambassador, Kotzebue went to St Petersburg, where he obtained a situation under Von Bawr, general of engineers. The latter became his warm friend, and recommended him to the empress, who, on the death of Bawr, which occurred about two years afterwards, nominated him a counsellor. His imperial patroness first placed him in a judicial situation at Revel, and finally appointed him president of Esthonia, on which occasion he was ennobled. His literary ambition kept pace with his growing fortunes, and drama succeeded drama from his pen, with great, if not increasing rapidity. In 1790, on a journey to Pyrmont, he published his Doctor Bahrdt with the Iron Forehead, under the name of *Knigge;* a work which created a considerable sensation at the time of its appearance, but by which he lowered himself not a little in public estimation. Having received his dismission from the imperial service, he retired for a time to an estate which he possessed at some distance from Narva: but, in 1797, he returned to Weimar, with a pension of 1000 guilders. Three years afterwards, he was induced to pay a short visit to Russia; but he had scarcely crossed the frontiers of the empire when he was arrested by order of Paul I. and sent to Siberia. This treatment of Kotzebue is said to have originated in a suspicion of the autocrat that he was the author of some political pamphlets, in which the emperor was personally attacked; but the exile was kept entirely ignorant of the cause of his banishment. He was, however, shortly afterwards recalled, and, as he informs us himself, well received by the emperor, who confided to his direction the theatre of St Petersburg.

After the death of Paul I. Kotzebue returned to Weimar, and in 1802 was admitted a member of the Academy of Sciences at Berlin. Some disputes which he had with Goëthe and the Schlegels induced him to remove to Paris, where the French literati flattered his love of adulation by the attentions which they paid him. It is not much to his credit that he repaid their kindness by the publication of a calumnious work entitled My Recollections of Paris. The Italians were treated in the same spirit of illiberality in his Recollections of Rome and of Naples. About the end of 1803 he commenced, in conjunction with Merakel, a journal entitled Der Freymüthige, The Sincere, in which Napoleon was virulently attacked. In 1806 he went again to Russia, and lived from 1807 on his estate in Esthonia, never ceasing to write against the imperial usurper of France. Literature and politics continued to engage the pen of Kotzebue until 1813, when, as counsellor of state, he followed the Russian head-quarters during the campaign of that year; and, in order more effectually to excite the nations against Napoleon, he published in Berlin the Russian-German National Gazette (*Volksblatt*). After the affairs of Europe were decided by the victory of Waterloo, he went to St Petersburg; but was in 1817 commissioned by the Emperor Alexander to return to his own country, and report upon the state of literature and public opinion, for which he was to receive a salary of 15,000 roubles. He who had exerted himself so much in favour of Russia, sometimes, it is affirmed, at the expense of his native country, was not likely to be warmly welcomed on his return home. From the first he was looked upon as a spy; and the zeal which he displayed in his new employment soon confirmed this opinion, and prepared the way for his destruction. He established a literary weekly paper, in which judgment was passed on the publications of the day, and political opinions advanced, at once dishonourable and obnoxious to Germany, then awakening from its torpor, and heated with the expectation of concessions on the part of its rulers, and by delusive anticipations of representative systems. In his journal Kotzebue steadily ridiculed every attempt to form liberal institutions; and not only was every species of political amelioration opposed, but a marked enmity to the liberty of the press was exhibited. A private communication of his to the emperor of Russia, which had been obtained, it matters not how, was published in a German paper, and republished throughout the country; and its appearance excited a strong feeling of hostility and indignation against the author. Shielded as he was by the power of the autocrat, he found it necessary to quit Weimar for Manheim, where his literary and diplomatic labours were resumed with increased activity. Unfortunately for him, he began to point his pen more directly against the enthusiastic anticipations and theoretical notions of liberty which had become the distinguishing characteristic of the great mass of the students at the German universities. A spark of dangerous enthusiasm caught the heated and disordered mind of a young student named Sand, who doomed the versatile dramatist and venal party writer to the death of a Cæsar, under the impression that he was only performing an act of heroic virtue in the cause of national liberty. Having obtained admission into the house of his victim, he deliberately murdered him, on the 23d of March 1819, after which he gave himself up to justice, and suffered on the scaffold. Kotzebue was three times married, and left thirteen children. He wrote about a hundred dramas, the best of which are the comedies, and even these are far from being first-rate productions. As a dramatist he is more artificial than natural, and more melodramatic and picturesque than profound in the knowledge of the human heart, or happy in the concoction of incident or illustration of manners. Some of his plays, however, have been translated into English, and adapted to the British stage with great success. His Misanthropy and Repentance, under the title of the Stranger, is a stock piece; and his Spaniards in Peru, or the Death of Rolla, metamorphosed into Pizzaro by Sheridan, was the most successful play ever produced in this country. Kotzebue wrote a history of the German empire, and the Early History of Prussia; but as a historian he is held in little esteem by his countrymen. (R. R. R.)

KOUANGNAN-FOU, a city of China, of the first rank, in Yunan, separated from the rest of the province by frightful mountains. The inhabitants are stigmatised by the Chinese as barbarous. Long. 106. 14. E. Lat. 30. 32. N.

KOUANGSIN, a city of China, of the first rank, situated on a river which falls into the Poyang Lake. It is surrounded by lofty mountains, and carries on considerable manufactures of paper and candles. Long. 117. 44. E. Lat. 28. 27. N.

KOUBCABEIA, a considerable town of Darfoor, in Central Africa. It constitutes the key of the western road through the country, and is the depôt of all the merchandise brought from the west. A market is held here twice a week, the chief medium for goods of small value being salt. The inhabitants obtain this article by collecting and boiling the earth of those places where horses, asses, and other animals, have long been stationary. This market is celebrated for the quantity of *tokeas*, or coarse cotton cloths, here disposed of, and for the manufacture, if such it may be called, of leather sacks for corn, water, and other purposes. The inhabitants are a mixture of Foorians, who speak their own language; Arabs, Fellatahs, and individuals from Bengoo, and other western countries.

KOULI KHAN, Thamas, or *Schah Nadir*, was not the son of a shepherd, as the authors of the English Biographical Dictionary assert; his father being chief of a branch of the tribe of Affchars, and governor of a fortress erected by that people against the Turks. Upon his father's death, his uncle usurped his government, under the pretext of taking care of it during the minority of Kouli Khan, or, more properly, young Nadir. Disgust at this affront made him commence adventurer. He entered into the service of the beglerbeg or governor of Muscada, in Khorassan, who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Usbec Tartars having made an irruption into Khorassan with 10,000 men, the beglerbeg, whose whole force consisted only of 4000 horse and 2000 infantry, called a council of war, in which it was declared imprudent to face the enemy with such an inferior force; but Kouli Khan proposed to march against the enemy, and engaged to conduct the expedition, and to be answerable for the success of it. He was accordingly made general, defeated the Tartars, and took their commander prisoner. Hossein Beglerbeg received him at his return with marks of distinction; but growing jealous of his rising fame, instead of obtaining him the rank of lieutenant-general of Khorassan, as he had promised, obtained it for another; which so exasperated Kouli Khan, that he publicly complained of the governor's ingratitude and perfidy, who thereupon broke him, and ordered him to be punished with the bastinado so severely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inserted in this work. In 1729 he was made general of Persia by Schah Thamas, and permitted to take his name *Thamas*, and that of *Khuli*, which signifies *slave*. His title therefore was *The Slave of Thamas*, but he was ennobled by the addition of Khan. In 1730, he fomented a revolt against his master, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739, he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being assassinated by one of his generals, in league with his nephew and successor, in 1747, aged sixty.

KOUMA, a river of Asiatic Russia, which rises in the Caucasus, between the Terek and the Cuban, and, taking an easterly course, loses itself in the sand before reaching the Caspian Sea.

KOUMISS, a sort of Tartar wine, made of fermented mare's milk. It is used by the natives as their common beverage during the season of it, and often serves them instead of all other food.

KOUMYKS, a Tartar and Mahommedan tribe, who live in a sandy plain at the foot of the Caucasus, on the right bank of the Terek. They are nominally subject to Russia, though this does not restrain their predatory incursions into its vicinity. They carry on some trade on the Caspian Sea.

KOUZNETZK, a small fortified town in Asiatic Russia, and capital of a district of the same name, in the government of Tomsk. It was founded in 1618; and the sable being here of peculiar beauty, the place is a great resort of fur-merchants. Population 500. Long. 87. 30. E. Lat. 53. 20. N.

KOWNO, a city of the province of Wilna, in Russia, the capital of a circle of the same name, on the river Wilna. It contains one Lutheran and ten Catholic churches, is an old, well-built town, with 608 houses and 3200 inhabitants. It has some trade in linen, and, by the river, which runs to the Niemen, in corn. Long. 26. 53. 55. E. Lat. 54. 53. 30. N.

KRAILSHEIM, a town of Wirtemberg, in the circle of the Jaxt, and the capital of a bailiwick of the same name, which extends over 154 square miles, and contains a population of 22,500 persons. The town is on the Jaxt, contains two churches, 420 houses, and 2900 inhabitants, employed in linen, cotton, and other manufactures.

KRAKATOA, the southernmost island of a group situated in the Straits of Sunda, about ten miles in circuit. It contains a hot spring, used by the natives as a bath, and is esteemed more healthy than any of the neighbouring islands. The coral reefs with which it is surrounded afford abundance of turtle. It has a high peaked hill on the south, which lies in long. 105. 15. E. lat. 6. 9. S.

KRAKEN, the name of an animal of a monstrous size, supposed to have been seen at sea, in the existence of which the weakness and credulity of the fishermen have excited the belief of even respectable naturalists, and amongst others Bishop Pontoppidan, who describes it in his *Natural History of Norway*. It is probable that the whole depends on certain optical appearances arising from a peculiar state of the atmosphere, which thus exhibits to the deluded fancy something of the form of a huge animal.

KRANTZ, Albert, a celebrated German chronicler, was born at Hamburg about the middle of the fifteenth century. Having finished his studies, he set out upon his travels, in the course of which he visited several parts of Europe, attending the prelections of the most distinguished professors, cultivating the society of the learned, and exploring public libraries, by which means he made acquisitions in knowledge equally varied and extensive. He took his degree at Rostock, and on that occasion supported several theses with so much distinction that he was retained to teach philosophy and theology. Krantz was rector of this university in 1482. But being recalled to Hamburg, he was provided with a canonry in the cathedral, and divided his time between preaching and teaching theology. Elected syndic of Hamburg in 1489, he assisted the same year at the assembly of Wismar, where the interests of the Hanseatic towns were discussed. They deputed him to proceed to France in 1497 to demand a treaty, and to England in 1499 to solicit assistance against the pirates who infested the North Sea. In these different missions he evinced so much prudence, sagacity, and integrity, that John king of Denmark, and Frederick duke of Holstein, chose him, in 1500, to terminate the dispute which had arisen between them on the subject of the province of Ditmarsen. Krantz, having been named dean of his chapter in 1508, laboured with great zeal to remedy the disorders which had been introduced into ecclesiastical discipline; but it is only by a forced interpretation of some passages in his works, that Wolf, and after him Bayle, have endeavoured to make him be considered as one of the precursors of Luther. Krantz was witness to the first attacks of that reformer on the church of Rome, and condemned them. He died on the 7th of December 1517, and was interred near the eastern gate of his cathedral. Krantz was a very learned man; and the historical works which he left behind him are useful, notwithstanding the errors by which they are disfigured. Some critics have accused him of plagiarism and of bad faith; but he has found numerous apologists, amongst whom may be mentioned Cisner, who places him in the first rank of the writers of his age, not only for the elegance of style and the clearness of method, but also for the love of truth. Krantz was the author of, 1. Chronica Regnorum Aquilonarium, Daniæ, Sueciæ, Novoagiæ, Strasburg, 1546, in folio; 2. Saxonia, sive de Saxonicæ Gentis vetusta origine, longinquis ex-expeditionibus susceptis etc. libri xii. Cologne, 1520, in folio; 3. Vandalia, sive Historia de Vandalorum vera origine, variis gentibus, crebris e patria migrationibus, etc. Cologne, 1519, in folio; 4. Metropolis, sive Historia Ecclesiastica Saxoniæ, Basil, 1548, in folio; and some other works of little importance. (A.)

KRASNISTAW, a town of Poland, in the province of Lublin, the capital of a circle of its own name, on a lake and the river Wieprz. It is surrounded with walls, and defended by a citadel, and contains 481 houses, and 3240 inhabitants, of whom many are Jews. Long. 23. 1. 39. E. Lat. 50. 58. 46. N.

KRASNOIARSK, a town of Asiatic Russia, in the government of Tomsk, situated on a small river tributary to the Yenesei. The road to Irkoutsk passes through this place, through which there is a considerable transit of commodities for the trade with China and Eastern Siberia. The surrounding country is remarkable for fertility, and provisions are exceedingly cheap.

KRAW. This isthmus connects the Malay peninsula with the continent of Asia, and in the narrowest part does not exceed ninety-seven miles across from sea to sea.

KREMENTSCHUK, a city of the province of Pultowa, in Russia, the capital of the circle of the same name. It stands at the mouth of the Kagamlik, where that river falls into the Dnieper. Its fortifications have been turned into pleasant walks. It contains 1200 houses, and 8600 inhabitants. It enjoys considerable trade on the navigable river, in native products, and has some manufactures, and extensive fisheries on the Dnieper. Long. 33. 23. 40. E. Lat. 49. 3. 10. N.

KREMNITZ, a city of the circle of Barsch or Bars, in the Austrian kingdom of Hungary. The city, with its extensive suburbs, contains 1200 houses, and 9678 inhabitants. There is a college of mining, a mint where ducats are coined, a gymnasium, and a Lutheran grammar school. The chief employment is in the working of the silver and gold mines in the surrounding district, and purifying these metals. Long. 18. 32. 35. E. Lat. 48. 42. N.

KREMS, a city of Austria, in the circle of Manhartsberge, and province of the Lower Ens. It is on the Danube, is well built, and contains a nunnery founded for English females. There are some manufactories of vinegar, of mustard, and of linen goods, and some good wine is made. It contains 424 houses, and 3650 inhabitants. Long. 15. 30. 42. E. Lat. 48. 21. 39. N.

KREMSIER, a city of the circle of Prerau, in the Austrian province of Moravia, on the river March. It is the seat of the Archbishop of Olmutz, whose castle is here, with a fine gallery of pictures and a library of 30,000 volumes. It contains, besides the minster, six churches, 420 houses, and 4100 inhabitants, who successfully cultivate vineyards.

KRESTXY, a city of the province of Novogorod, in Russia, the capital of a circle of the same name, extending over 372 square miles, comprehending one city, 730 villages and hamlets, with 47,387 inhabitants. The city is on the river Khalowa, contains 450 houses, and 1874 inhabitants. Long. 32. 28. E. Lat. 58. 20. N.

KREUZ, a circle in the Austrian province of Croatia, which extends over 664 square miles, and comprehends two cities, two market-towns, and 294 villages and hamlets, with 66,885 inhabitants. The capital is a city of the same name, on the river Golkoniska, the seat of a bishop, with 302 houses, and 1819 inhabitants. Long. 16. 26. 58. E. Lat. 46. 1. 16. N.

KREUZNACH, a city of Prussia, the capital of a circle of the same name, in the province of Lower Rhine. It is on the river Nake. It contains 700 houses, and 7205 inhabitants. It has fabrics of leather, snuff, and soap, and very considerable establishments for salt refining, and has a lively trade in wine grown near it, and in oil, potash, corn, spirits, and clover-seed.

KRISHNA. See Kistna.

KROMY, a town of the province of Orel, in Russia, the capital of a circle of the same name, on the river Kroma. It contains seven churches and 300 houses, with 3100 inhabitants. Long. 35. 51. E. Lat. 52. 38. N.

KRONSTADT, a city of Hungary, in that division of the province of Siebenbergen denominated Sachsenland. It is on the frontier towards Wallachia, in a plain watered by numerous brooks, which unite to form the river Aluta. It is an irregular-built town, but surrounded with walls. It contains six Lutheran, two Greek, two Catholic, and one Unitarian church, and a Franciscan convent, with a church and cloth manufactory attached to it. It contains, including the suburbs, which are extensive, 3200 houses, and at the lowest estimate 25,000 inhabitants, among whom are Germans, Hungarians, Wallachians, Greeks, Armenians, and some Turks, who carry on a variety of manufactures for the supply of the home market. Long. 28. 28. 25. E. Lat. 45. 56. 30. N.

KROOK, a city of Persia, in the province of Kerman, and capital of the district of Nurmanshur. It is of a considerable size, and is surrounded with a deep ditch. 150 miles south-east of Kerman.

KROSSEN, a fortified city, the capital of a circle of the same name, of the Prussian province Brandenburg. It is on the Oder, near to where the Bober falls into that river. It contains 574 houses, and 3605 inhabitants. The manufactures are of cloth and hosiery.

KROTOSZYN, a city of Prussia, in the circle of the same name, of the province of Posen. It is a frontier place towards Poland, but now without fortifications, since the union of Posen with Prussia. It contains 535 houses, and 4860 inhabitants, speaking mostly the Polish language, and employed in manufactures of cloth, linen, leather, paper, and tobacco.

KRUMAU, a city of the circle of Budweis, in the Austrian kingdom of Bohemia. It is on the river Moldau, is fortified, and, with about 300 villages around it, forms a dukedom belonging to the Schwarzenburg family. The castle and part of the duchy is near the city, which contains 696 houses, and 4291 inhabitants, some of whom are stocking-makers, and others cloth and paper manufacturers. Near to it are the baths of Umlowitz, much frequented in summer; and some mines of silver, but feebly worked.

KTEIFA, a small town of Syria, in the pachalic of Damascus, on the borders of the Desert. It is surrounded with walls of sufficient strength to defend it against the travelling Arabs. It is twenty-two miles east-north-east of Damascus, and is supposed to be the ancient Adarisi.

KUARA, a very mountainous province situated in the western part of Abyssinia. It is a rugged, unhealthy country, and its chief importance consists in the gold which passes through it from the east. It receives a governor from Abyssinia when it dares not to do otherwise.

KUBBEER, a large salt lake, or rather marsh, of Persia, in the province of Irak. It runs from east to west about 150 miles, and is in some places thirty-five miles in breadth. There are roads through this morass, but they are not easy distinguished, and the unfortunate wanderer who misses them is in danger either of perishing in the swamp or of dying from thirst and heat. The road from Koom to Tehran crosses a part of this morass.

KUBBEES, a city of Seistan, in Persia, situated on the road from Kerman to Herat, in the midst of a desert, 150 miles north-east from Kerman, and 160 north-east from Yezd, and the whole intermediate space being an arid waste, intersected with one or two ranges of mountains. There is a path through this desert, by which couriers go; but the danger of perishing is so great, that a person of this description demanded 200 rupees from Lieutenant Pottinger, to carry a letter to his fellow-traveller, Captain Christie.

KUFA, a city of Irak Arabi, once a large and populous city, founded by Omar after the ruin of Ctesiphon, and the residence of the caliphs, until, owing to the vices of the inhabitants, the seat of government was removed to Bagdad. Little is left of this place but the mosque where Ali was assassinated, a plain edifice, in the form of a square, with a court in the centre, surrounded by a cloister. There is but one entrance, through an elegant gateway; and the walls being high, and flanked with bastions, give it more the appearance of a castle than a place of worship. The Mahommedans hold in high veneration the spot on which this mosque has been built; and their imams or priests, to add to its sanctity, have invented many wonderful stories concerning it. Four miles north of Meshed Ali.

KUFFSTEIN, a small city of the Austrian province of Tyrol, on the river Inn. It is remarkable for the strength of its works, which, in conjunction with those of the fortress of Geroldstein, opposite to it, defends one of the important passes between Italy and Germany.

KUILENBURG, a city of the Netherlands, in the province of Gelders, and circle of Thiel. It stands on the river Leck. It is surrounded with walls, and divided by the river into three parts, which are connected by handsome stone bridges. It is an increasing place, containing, in 1830, 4299 inhabitants, who are occupied in making silk goods, ribbons, and fire-arms.

KULM, a city, the capital of a circle of the same name, in the province of West Prussia, on a hill, at the foot of which the Vistula flows. It is the see of a Catholic bishop, and has an ecclesiastical seminary for that religion, with four professors and about 120 pupils. It contains 397 houses, and 3640 inhabitants. It was formerly a place of great consideration, and one of the Hanse Towns, but has declined. Long. 18. 20. 41. E. Lat. 53. 21. 6. N.

KULMBACH, a city of Bavaria, the capital of the bailiwick of the same name, in the circle of the Upper Maine. It is on the river White-Maine, in one of the finest situations of the circle. It is surrounded with walls, has a fine market-place, several public buildings, 437 houses, and 3420 inhabitants.

KUMBALIA, a town of Hindustan, in the Gujerat peninsula, situated about five miles from the Gulf of Cutch, and subject to the chief of Nooanager. It is a populous and well-built town, surrounded by a stone wall, with round bastions, and four gates, which are sufficient to keep the surrounding country in awe. This place is the resort of the Gogia Brahmins, who are attendants on Ranchor, an incarnation of Vishnu and Dwarca. Having accumulated fortunes from the offerings of the pilgrims resorting to the pagoda, they have retired to Kumbalia, which is well adapted for commerce, to which they are much inclined. The port of this place is Sirreyah, at which vessels anchor, and send up their cargoes in boats. Long. 69. 45. E. Lat. 22. 15. N.

KUMI, an island in the Eastern Seas, about three or four leagues in circuit, populous and cultivated. It is one of a cluster, consisting of six or seven others between Formoza and Japan, seen by Perouse. Long. 23. 16. E. Lat. 24. 33. N.

KUNASHIR, an island in the Eastern Seas, forming part of the small archipelago of the Kuriles. It is 100 miles long, and thirty-five broad. The Russians have erected a small fort on this island.

KUNCKEL, John, a celebrated Saxon chemist, was born in the duchy of Sleswick, in 1630. He became chemist to the elector of Saxony, the elector of Brandenburg, and Charles XI. king of Sweden, who gave him the title of Counsellor in Metals, and letters of nobility, with the surname of Louwensteing. He employed fifty years in chemistry, in which, by the help of the furnace of a glasshouse which he had under his care, he made several discoveries, particularly those of the phosphorus of urine. He died in Sweden in 1702, and left several works, some in German, and others in Latin; amongst which, that entitled *Observationes Chemicæ*, and the Art of Making Glass, printed at Paris in 1752, are the most esteemed.

KUNDAL, a town of Hindustan, in the province of Bengal, surrounded by a country which is one entire forest, abounding with all sorts of wild animals. Seventy-four miles south by west from Dacca. Long. 91. 18. E. Lat. 23. 12. N.

KUNDAPOOR, a sea-port town of India, in the province of Canara, situated near the mouth of a river, which is the boundary of the northern and southern divisions of Canara. On the north side of the river, Tippoo formerly had a dock, which is seldom used by the British. The town consists of 300 houses, and was formerly garrisoned by a detachment of native infantry. Long. 74. 47. E. Lat. 13. 33. N.

KUNEE, town of Hindustan, province of Delhi, and district of Sirhind. It is surrounded by a mud wall and a deep ditch, but was taken by the British in 1809, without resistance.

KUOPIO, a circle in Russian Finland, on the sea-shore, of the vast extent of 20,608 square miles, containing only one town and 4423 farms, with 144,500 inhabitants. The capital, of the same name, is a town in a peninsula on the Lake of Kallavesi, containing 160 houses, and 920 inhabitants. Long. 27. 24. 55. E. Lat. 62. 53. 43. N.

KUPH, an extensive ruined village of Syria, which appears to be the remains of a large town. The buildings appear like magnificent palaces. The style of architecture is of the fourth or fifth century; and the crosses over the door show the buildings to have been Christian. Thirty-five miles south-south-west of Aleppo.

KUR, the ancient Cyrus, the most considerable river of Georgia, in Asia. It has its rise, according to Sir R. Kerr Porter, in a branch of the Caucasian Mountains, from which issue several rivulets, which, uniting in one channel, take the name of Kur; and flowing thence through part of the Turkish dominions, gradually augments its stream by the reception of minor rivers in its course. From this point the Kur takes a south-east direction, fertilizing a country of as much beauty as grandeur. Its most considerable tributaries in this part of its course are, the Aluzan from the north-east, and the Araxes from the south, which falls into the Kur about seventy miles from its mouth. After this junction, the breadth and depth of the Kur are so much increased, that it immediately becomes navigable for larger boats. At fifty miles lower down, it divides itself into two noble branches, and so flows onward, through the province of Maghan, to the north-west coast of the Caspian, whence, by these double channels, it unites its waters with the sea. The banks are very high, and wooded.

KURDA, a town of Hindustan, in the province of Gujerat, situated near the north-west frontier, about three miles south of the town of Theraud. It is surrounded by a sandy and unproductive country.

KURGOMMAH, a town of Hindustan, in the province of Gundwana. It is situated in the middle of a very wild country inhabited by Goands, who are so uncivilized as not to know the value of the precious metals, their only currency being cowries or shells. Long. 82. 25. E. Lat. 23. N.

KURIL, or Kuriliski Isles, extending from north latitude 51. to 45. which probably once lengthened the peninsula of Kamtschatka before they were disjoined from it, are a series of islands running south from the low promontory Lopatka, which is distant one league from Shoomska, the most northerly of these. Of the twenty-one islands subject to the Russian empire, no more than four are inhabited. The rest of these islands remain wholly uninhabited, but are visited occasionally, for the purpose of hunting otters and foxes.

KURSK, a province of European Russia, which extends over 15,430 square miles, comprehending seventeen cities, 137 towns, 1532 villages and hamlets, and containing a population of 1,611,100 persons. It is between 50. 20. and 52. 26. north latitude, and is consequently in a temperate climate. It is an undulating district, with no elevations entitled to the name of mountains. Although well watered by the rivers Donez and its tributary streams, it is neither swampy nor marshy, but enjoys a dry soil. It is fertile, and the increase of corn from the same measure of seed is greater than in any of the provinces to the north of it. As the greater portion of the people are occupied in agriculture, the chief surplus produce consists of corn, amounting in some years to upwards of 4,400,000 quarters. This forms the chief commodity for exportation, besides which, corn, spirits, hemp and hemp oil, tobacco, hides, leather, wool, tallow, wax, honey, horses, and horned cattle, are supplied to the neighbouring provinces. From the want of navigable rivers, most of the commodities must be conveyed to the Wolga on wheel carriages, which, as the roads are bad, becomes very expensive. There are in this province a great number of nobles, who among them possess 239,000 peasants or slaves. The province is divided into fifteen circles. The city of Kursk is the capital of the province, as well as of the circle of that name. It is the seat of an archbishop. It stands at the junction of the rivers Kura and Tuskar, and has been fortified, but the walls are converted into pleasing promenades. It contains sixteen churches, two convents, an ecclesiastical seminary, 2340 houses, and 21,500 inhabitants. It is a place of extensive trade in wax, tallow, hemp, and the other productions of the soil, and the seat of some manufactures; and near it the gardens produce fruits that will not grow in the more northern parts of the empire. Long. 36. 22. E. Lat. 51. 43. N.

KURZOLA, an island in the Adriatic Sea, a portion of the Austrian province of Dalmatia. The extent is about 220 square miles. It is well wooded, and affords good ship timber. It yields good wine, and some corn, but is deficient in water. The inhabitants are 6440, of whom 1800 live in the fortified capital of the same name, in a narrow strait on the east end of the island.

KUSTER, Ludolf, a very learned writer in the eighteenth century, was born at Blomberg in Westphalia. When very young, he was, upon the recommendation of Baron Spanheim, appointed tutor to the two sons of the Count de Schwerin, prime minister of the king of Prussia, who, upon our author's quitting that station, procured him a pension of four hundred livres. He was promised a professorship in the university of Joachim, and, till this should become vacant, being then but twenty-five years of age, he resolved to travel. He read lectures at Utrecht, went to England, and thence proceeded to France, where he collated Suidas with three manuscripts in the king's library, which furnished him with a great many fragments that had never been published. He was honoured with the degree of doctor by the university of Cambridge, which made him several advantageous offers to continue there, but he was called to Berlin, and there installed in the professorship which had been promised him. He afterwards went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Protestants. The king of France rewarded him with a pension, and ordered him to be admitted a supernumerary associate of the Academy of Inscriptions. But he enjoyed this only a short time, having died in 1716, at the age of forty-six. He was a great master of Latin, and wrote well in that language; but his chief excellence consisted in his skill in the Greek language, to which he almost entirely devoted himself. He wrote many works, the principal of which are, 1. Historia Critica Homeri; 2. Jamblicus de Vita Pythagoræ; 3. An edition of Suidas, Greek and Latin, in three volumes, folio; 4. An edition of Aristophanes, Greek and Latin, in folio; 5. A new edition of the Greek New Testament, with Dr Mills's Variations, in folio.

KUSTERDINGEN, a town of Wirtemberg, in the circle of the Black Forest, and bailiwick of Babenhausen. It contains 175 houses and 1230 inhabitants, who grow much flax, and convert it into linen and diaper cloth.

KUSTRIN, a city, the capital of a circle of the same name, in the province of Brandenburg, in Prussia. It is a strongly fortified place, with a fortress on the river Oder, surrounded by ditches and marshes, by which the approaches of assailants are impeded. It is one of the chief defences on the east of the kingdom, is always strongly garrisoned, and well stored with ammunition and provision, and commands a bridge over the river 880 feet in length. It contains 562 houses, and 6220 civil inhabitants. Long. 14. 35. E. Lat. 52. 35. N.

KUTTENBURG, a city of the circle Czaslau, in the Austrian kingdom of Bohemia. It is a well-built town, with a magnificent cathedral and thirteen other churches, and containing 746 houses and 6417 inhabitants. The chief employment is mining for silver, lead, and copper, in the country around. There is a house for smelting the silver, another for refining saltpetre, and several establishments for manufacturing the several metals.

KUTUBDEA, an island in the bay of Bengal, thirteen miles in length by four in breadth, adjacent to the district of Chittagong, being separated from it by a narrow strait two miles broad, into which a vessel, in case of distress, may safely run. In its vicinity are some valuable oyster-beds: the oysters are of an excellent quality, and are sent for sale to the Europeans at Dacca and Calcutta.

KUTY, a city of the circle of Kolomea, in the Austrian kingdom of Gallicia, on the river Czerny. It contains a Greek and an Armenian church, with 430 houses and 4110 inhabitants, of whom 520 are Armenians.

There is much occupation in the curing of leather, in a way similar to that followed in Russia.

KYLE, a district of Ayrshire, in Scotland. There are three districts in Ayrshire, Carrick to the south, Kyle in the middle, and Cunningham to the north. Carrick is divided from Kyle by the river Doon. The boundaries of Kyle are the river Doon on the south, and the river Irvine on the north. See AYRSHIRE.

KYPHONISM, KYPHONISMUS, or CYPHONISMUS, an ancient punishment frequently undergone by the martyrs in the primitive times, wherein the body of the sufferer was anointed with honey, and so exposed to the sun, that the flies and wasps might be tempted to torment him. This was performed in three ways. Sometimes they only tied the patient to a stake; at other times they hoisted him up into the air, and suspended him in a basket; and at others, again, stretched him out on the ground with his hands tied behind him. The word is originally Greek, and comes from κυφον, which signifies either the *stake* to which the patient was tied, the *collar* fitted to his neck, or the *instrument* with which they tormented him. The scholiast on Aristophanes says it was a wooden lock, or cage, and that it was called so from κυπτειν, to *bend*, because it kept the tortured in a bent posture; but others take the κυφον for a log of wood laid over the criminal's head, to prevent his standing upright; and Hesychius describes it as a piece of wood on which criminals were stretched and tormented. In effect, it is probable the word might signify all these several things. It was a generic term, and these were merely the species. Suidas gives us the fragment of an old law, which punished those who treated the laws contemptuously with kyphonism for the space of twenty days; after which they were precipitated from a rock, dressed in women's habit.

KYRAUT, a district of Northern Hindustan, situated between the twenty-seventh and twenty-eighth degrees of north latitude. It is bounded on the north by the Himalaya ridge, on the east by Bootan, on the south by Morung, and on the west by Nepaul, from which it is separated by a large tract little known to Europeans. The river Teesta is the principal river, and Damsong the chief town. It was conquered in 1769 by the rajah of Gorcah.

KYRAHGUR, a town of Hindustan, belonging to the grand rajahs tributary to the Nagpoor Mahrattas, in the province of Gundwana, eighty-six miles south-west from Ruttunpoor. Long. 81. 32. E. Lat. 21. 27. N.

KYREEGHUR, a town of Hindustan, in the province of Oude, situated on the east side of the Goggrah river, 102 miles north from Lucknow. Long. 80. 51. E. Lat. 28. 18. N.

END OF VOLUME TWELFTH.
